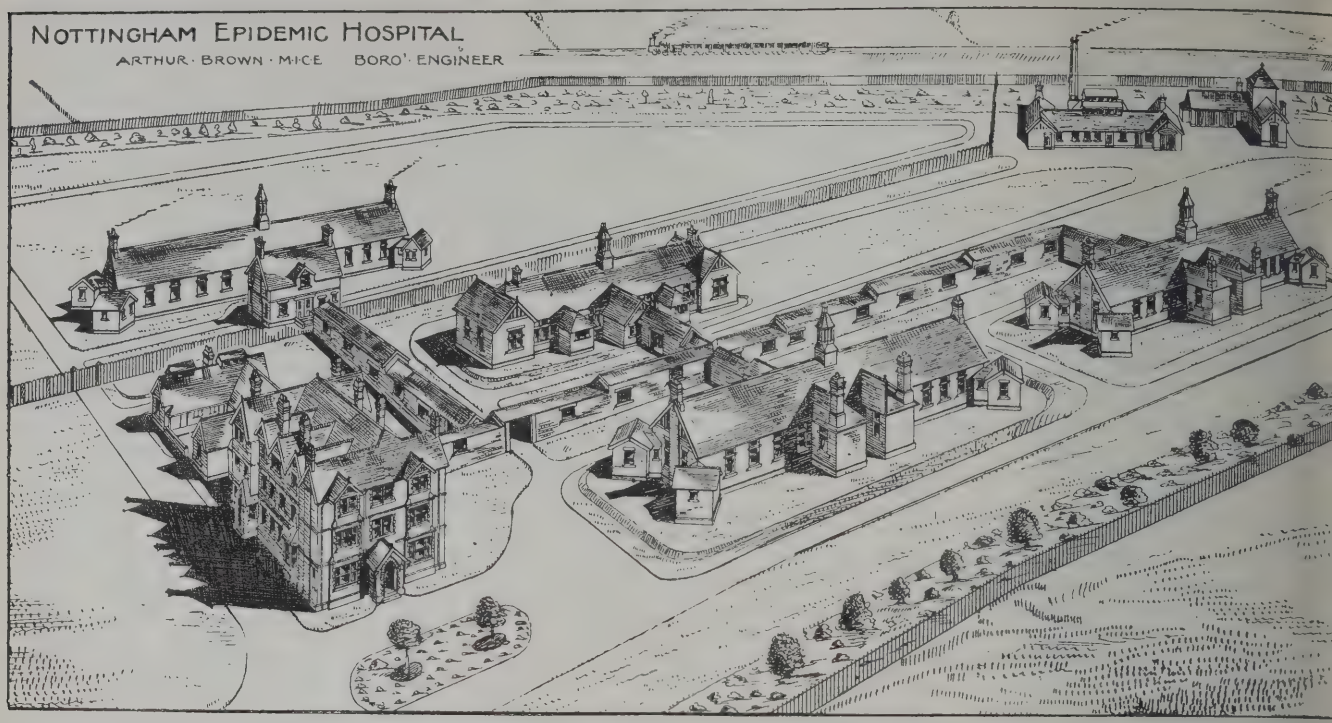
HIS design was submitted in competition under ıe motto "Northern Light" by Mr. Archiald Neill, architect, of 18, East Parade, Leeds, ho thus describes the buildings which are) be erected at the junction of Knowsley-reet and Moss-lane, and next the Lanıshire and Yorkshire Railway siding adjacent. he chief points arrived at in the preparaion of these designs have been as follows:—irstly, to adhere strictly to the "Instrucions" and particulars contained in the papers upplied to competitors; secondly, to provide uch general and detailed accommodation as a nowledge of local customs and requirements eem to dictate, modified and amplified only to uch an extent as the rapidly increasing deıands of the town appear to warrant; thirdly, o so plan and arrange all the internal accomnodation as shall insure the maximum revenue s far as consistent with perfectly convenient nd satisfactory working, and, further, render uture additions and extensions easy without emoving or in any way interfering with existng work; and, fourthly and lastly, to produce uch an external and internal architectural apearance as may serve to at once indicate the ıses to which the buildings are to be devoted, nd of a sufficiently imposing and important haracter for the position which has been fixed pon for their erection. In planning, a leading uestion was whether to arrange residences over hops or not, and after full consideration it was ecided that the importance of the Moss-lane rontage warrants the provision of show rooms; herefore, especially considering the encroachment on market area by the open yards which would be necessary for dwellings, it was decided o place show rooms and assistants' rooms only ver these shops. Twenty lock-up butchers' talls or shops around the area of general market, ach shop furnished with the usual 32-in. tall-board, counter, and block, three-tier rails nd hangers, ventilating gratings throughout; ined to a height of five feet with enamelled bricks and salt-glazed above. The stalls are of he double range and passage type, as being very onvenient for serving and preventing confuion, and now very generally adopted in our better-class English and Welsh markets—a proportion to be eventually ascertained should be framed with inclosures beneath, and in a few instances with back tiers. A small number of lock-up stalls are shown in tolerably central position for the sale of books, clothing, cloth, dry goods, &c., and in these buildings suggest them as being important, but if not desired, no interference with general design would be requisite by their omission. Wholesale pitches or spaces for disposal of vegetables, fruit, &c., by auction have been provided in central position; but when market is extended a roadway for carts should be made next the wholesale fish market, so that heavy loads may be brought direct to a central position, and thus avoid the confusion and interference caused by much trolly work. A limited space only is proposed for the wholesale meat sub-department, as from inquiry such will be sufficient, but further accommodation may easily be gained by fixing extra three-tier rails and hangers. An imposing but economical domed entrance is a feature of the building. Fruit, flowers, sweets, and toys can be retailed in this locality, and a gallery is suggested around it for the sale of plants and seeds. The fish markets have an entrance from the roadway for convenience in unloading; the wholesale department marked by rubbed slate lines in the floor to define the extent of "pitches." An ice-well of sufficient size to enable a stock to be taken enough to supply butchers and other tradesmen is provided. The retail portion should have divided stalls running at either side with light braced iron inclosures. Sloping rubbed slate slabs will be provided where necessary on glazed brick walls, with live fish tanks below in sundry instances. A fountain and clock are placed in a central position. Lavatories and water-closets are shown on right and left of chief entrance for men and women respectively, and with open areas, as in practice perfect ventilation of these offices is extremely difficult with any sort of roof or covering. A tolerably convenient position is accorded to furnace and hot-water apparatus in a corner of site in the basement. To mark and distinguish the building at a distance an increased altitude of some feature is a good point, and as a reliable source of water is only to be obtained by having a capacious tank, a suitable tower has been shown to serve the double purpose. From this tank a system of fire hydrants would be supplied, with hose and unions near all entrances and in convenient positions at sides of the chief avenues. The great points to be attended to in planning the abattoirs were to afford ample space and perfect ventilation throughout, around, and above all parts. Advantage has been taken of the form of ground to adopt the principle of open areas between lairs and slaughter houses, and wide verandah-sheltered avenues between the latter and the meat stores. The yards and sheds are arranged with open area between, and at the rear suggest the usual driving way, with gates so arranged as to serve the double purpose of inclosures and guides to turn cattle into lairs. In sheltered position at rear of buildings are placed the yards with drinking troughs and sheds for sheltering the stock. The condemned slaughter house and lair are placed in an isolated position separate from general buildings. The meat store is placed midway between the two ranges of slaughter houses and running the entire length of them, and this arrangement affords very uncommon facilities for equal extensions of the various branches of the building. At the head of this store will be arranged a small office for the weighing and entering clerk, also platform weighing machine and outside wide shelter for waggons or carts, with weigh bridge, fitted with register inside office. A very extensive area is required for hides and skins for sorting and parcelling, and as the conformation of site most happily favours the idea, a range of buildings is planned 18ft. high for this purpose in the basement, with large arched openings to the entire extent, glazed with louvre lights only, and with recessed loading way so as not to encroach upon general traffic space. Suitable drawing-off, storing, and drying room can be well arranged adjacent to meet requirements of blood department if required. Extensive boiler house is provided, so as to afford room for gas engine to work cranes if necessary. All external walls of market buildings will be of hand-pressed brick, all dressings of good quality ashlar from the district quarries, and all interior faces of hand-pressed brick with salt-glazed dado 5ft. high. The butchers' stall should have a 5ft. dado of enamelled brick with tinted skirting and capping and salt-glazed brickwork above. The whole of the walls of abattoir buildings to be of salt-glazed brickwork to a height of 5ft. (above that height in pressed brick), and all interior faces of meat store, store, and slaughter houses be faced to a height of 5ft. with enamelled bricks, above that level with salt-glazed bricks, and the interiors of lairs lined with salt-glazed bricks. The inclined approaches, avenues, and passage ways will be of stone setts on well-pounded hard-core foundations well grouted with cement. The floors of lairs should be of cement concrete. The floors of slaughter houses would advantageously be faced with large size cleansed Yorkshire flags, and all floors laid to centre or side open-air channelling. The floors of markets generally should be of Yorkshire tooled flagging on concrete. The floors of butchers' stalls of cement on concrete bed, with stone steps. The floors of lock-up stalls of wood with stone steps. All mineral floors to be laid to gentle gradients to facilitate cleansing, and sinks provided where necessary. Each slaughter house to have stop cock for hose attachment for cleansing purposes. The roofs of markets and abattoirs to be of iron, as being now almost universally used in preference to all other materials, covered with one-inch wrought tongued and beaded boarding on longitudinal spars, the exteriors being of slate on Croggon's felt and battens to 3-inch gauge. The whole of glazed portions to be of $\frac{1}{4}$-inch rough-cast plate glass. The following is the estimate of cost: The markets, including all walls, roofs, turrets, towers, chimney stacks, and other special features, 395,980 cubic feet, at 6d. per foot, £9,899 10s.; the abattoirs, ditto, ditto, &c., including earthworks, 549,600 cubic feet, at 6d. per foot, £13,740—total, £23,639 10s. We give a plan of the markets and a general view from the competition drawings.

CHOIR STALLS, SCREEN, ETC., ST. PAUL'S CATHEDRAL.



THE general scale drawings of this Royal Academy silver medal set of details, by Mr. Charles W. Baker, were published in the BUILDING NEWS for July 24th last, when we gave the author's description of the screen and choir-stalls in our great Metropolitan Cathedral. We now give a double-page plate of mouldings, carvings, and other enlarged parts, which cannot fail to be of practical utility to all engaged in the execution or design of high-class woodwork and joinery.

SOUTH KENSINGTON MUSEUM COMPETITION.

THE detail of Mr. Aston Webb's selected design for this national work, which we publish to-day, shows clearly enough the rich and in many ways original character of the ornament and minor parts which he has introduced into his fine composition, and which will contrast well with its great neighbour, the Natural History Museum. The materials to be used in the selected design are red brick and buff terracotta, to correspond with the existing portions of the Museum. Good lighting being of the first importance, the windows are designed wide and high, and the piers reduced to a minimum on the face, strength being given by the depth of the reveals and by the plain brick piers of the pavilion blocks. A round arched construction has been adopted with a delicate scheme or ornament, in which figure-work and sculptural decoration, indicative of the uses of the building, will form a principal feature, as will be found to some extent indicated on the detail drawing. The interior perspective illustrates Mr. T. G. Jackson's central court. His plans were given with the exterior last week.

GRIMSBY TURKISH BATHS.

THESE baths have been designed to afford in small and manageable compass the usual Turkish bath treatment as well as certain of the simpler forms of hydropathic treatment. The buildings are old ones adapted and altered for the purpose, as shown on the plan. An ordinary dwelling house on the street will serve as attendants' house, office, and board-room, as well as affording accommodation if required for resident patients. A large shed at the back has been fitted up with the various bathing apartments, all of which are lined with glazed brick, the cooling room forming the connection between the two blocks. A four-horse power boiler pumps the necessary water from a well on the premises, supplies steam to the vapour baths, and heats the water, as well as driving the laundry machinery (a department to be hereafter possibly extended), and by means of steam pipes heating the various hot rooms. In the

Turkish bath the fresh air drawn above the roof is led over a series of hot cylinders, and after circulating through the various apartments is drawn off at the floor level and discharged into the engine flue. All fumes of gas burners will be drawn off direct from the burners without in any degree mixing with the air. Direct radiation from heated steam-pipes will also assist the effect of the heated air. Messrs. Hewins and Goodhand, of Grimsby, are the builders. The whole of the building and heating arrangements have been designed by the architect to the company, Mr. John J. Cresswell, of Grimsby. The engineering work and heating have been undertaken by the Great Grimsby Co-operative Box and Fish Carrying Company, Limited.

NEW EPIDEMIC HOSPITAL, NOTTINGHAM.

This hospital was opened on the 15th of July. The buildings occupy a site of about 12 acres. At present, accommodation has been provided for 82 patients, but the administrative block, laundry block, and stabling are sufficiently large to allow for a large increase in the number of beds. The 82 beds are contained in four blocks, namely, two fever blocks containing 22 beds each; one small-pox block also containing 22 beds, and one isolation block containing 16 beds. The two blocks for fever and the one for small-pox patients are almost identical in plan and construction, and each consists of an entrance hall giving access to a ward kitchen, and two large wards, each 60ft. long, 25ft. wide, and 13ft. 6in. high, and each designed to accommodate 10 beds; there is also a small room attached to each large ward containing one bed, which may be used for any patient requiring special attention or isolation. The bath rooms and water-closets, &c., are contained in annexes divided from the large wards by short passages, having through ventilation; and a bathroom, coal place, foul-linen place, and stores are provided adjoining the entrance to each block. The isolation block consists of two wards, each accommodating four patients, and four wards containing two beds each, with the necessary bath rooms, stores, water-closets, &c. The small-pox block is divided from the remainder of the buildings by a fence 6ft. high, and an annexe has been built in connection with it to provide both day and night accommodation for the nurses attending small-pox cases, so that they need not visit the administrative block or have any intercourse with nurses attending other cases. The blocks are built on an impervious layer of cement concrete, and the walls are faced on the inside with coloured glazed bricks to a height of 5ft. above the floor, and above that are plastered in Parian cement. Each of the large wards is warmed by two steam radiators and two of Shorland's Manchester grates, and the ventilation has been carefully arranged; each fireplace and radiator has a fresh air supply direct from the outside, and delivers fresh warm air into the room, and there are fresh-air inlets under each bed. The smoke flues from the ward kitchen and from the ward fireplaces adjoining same are of iron, and are carried up in the centre of a ventilating tower 50ft. high, and have been arranged so that the heat radiated from the smoke flues assists the ventilation. In the ceiling of each ward are outlet gratings connected with tanks or channels carried above the ceiling and delivering into the ventilation tower, in which are placed two large Bunsen atmospheric burners to assist the up-draught. The wards are lighted by Wenham lamps, and the products of combustion are conducted to the ventilation tower in tubes carried in the centre of ventilation tanks. The administrative block is three stories in height, and contains on the ground floor waiting room and committee room, residence for medical officer, dispensary, matron's rooms and stores, kitchen, outbuildings, and the laundry for officials; upstairs there are altogether 18 bedrooms, with bathrooms and other conveniences. The laundry block is situated at the northern end of the site, and contains disinfector, boiler and engine house, laundry, drying room and ironing room. The stable block contains, besides stabling for two horses, the carriage houses for two ambulances and for vans for infected and disinfected goods. This block contains also the mortuary. At the entrance to the grounds is a lodge for the caretaker, and the grounds are inclosed where they abut upon the main road by a wall 7ft. high, and on the other three sides by iron hurdle fencing. The buildings are plainly built of brickwork with Hollington stone dressings, and the roofs are all covered with tiles. The administrative block is connected with the fever and other blocks by a corridor which is lined with a dado of glazed bricks; under this corridor is a brick subway divided into two chambers: in one are laid the gas and water pipes, and in the other the steam pipes, all easily accessible. The steam heating is on the low-pressure principle, and the steam required for heating the blocks, the two laundries, and cooking is provided by a boiler. The steam is conducted from the boiler house in the subway referred to, and is reduced by reducing valves to about 7lb. pressure before it passes through any of the radiators or is used for laundry or cooking purposes; the maximum distance to which steam is carried is about 250 yards. All the steam pipes are coated with non-conducting composition. The buildings have been designed by and carried out under the direction of Mr. Arthur Brown, M.Inst.C.E., borough engineer, assisted by Mr. F. B. Lewis, A.R.I.B.A., Assoc.Mem.Inst.C.E., the assistant engineer; Mr. E. Jones was the clerk of works. The total cost of the buildings, exclusive of l about £25,000. The contractors for the ings were Messrs. Wheatley and Maule, o tingham. The whole of the closets, slop and sanitary appliances are by Mr. Georg nings of London.

CHIPS.

Mr. George Tuttell, architectural sculpt Wharf-road, Grantham, died on Thursda week from the bursting of a blood vessel brain. The deceased gentleman had an apo fit on the previous day.

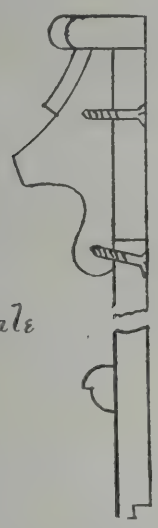
Thomas Hutton, road surveyor to the Eccl local board, appeared at the West Riding court at Bradford, on the 3rd inst., on a ch defacing voting papers relating to the elec members of the local board, and was fined costs, with the alternative of one month prisonment.

A warm correspondence has taken place be the commissioners of Motherwell, N.B., a Auldjo Jamieson, the Duke of Hamilton's missioner, anent the undermining of the town- that burgh, a building recently erected at a £6,000. In reply to a complaint, Mr. Ja demanded the sum of £1,884 10s. 3d., inc present payment of £500, for unworked mi underneath the town-hall; and, further, he that the Duke of Hamilton and his mineral t would not be liable for any damage that ha done, or may be done, by the working minerals adjacent to the building unpurcha the commissioners! The clerk has been inst to reply that the commissioners could not the terms offered, and, further, that they surprised and disappointed at the turn the had taken.

The proposal to place the Manchester me statue of John Bright on the Infirmary esp has been abandoned by the corporation of tha on the ground that the face would have a no aspect and could not be properly seen. It ha been decided to erect it on the Princess-stre of Albert-square, and to remove Bishop F statue to the opposite side, so as to face it.

Mr. C. C. Smith, until recently surveyor Skipton rural sanitary authority, and also Silsden urban sanitary authority, but at p town surveyor to the Dalton local board, w recipient on Saturday last of a very han massive timepiece, as a mark of esteem an token in appreciation of the conscientious disc of duties during the five years of connection the sanitary authorities named.

Noseley Hall, Leicestershire, the property Arthur Hazlerigg, Bart, and of great hist interest (having been used by Oliver Cromw his head-quarters in Leicestershire, from place he set out to destroy Ashby Castle), i undergoing extensive alterations and improve from the designs of Mr. J. Macvicar And President of the R.I.B.A. The builders are M Treasure and Son, of Shrewsbury and Londo



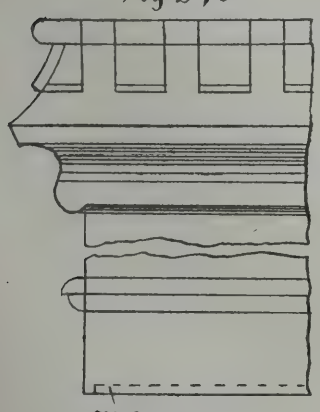
CARPENTRY AND JOINERY.—XL.

ENTABLATURES AND PEDIMENTS.

WE now come to a feature in door-case finishing which occurs only in buildings a semi-public or public character, or in the ate apartments and halls of mansions.

The simplest form of entablature is sometimes rmed an *overdoor*, and this name seems to be itable enough, as in furniture we have *over-antel*—both names serving at once to point out

Fig. 269.

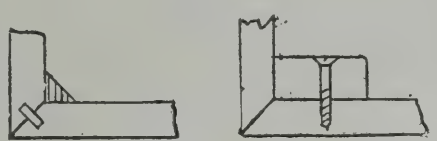


e locality where the objects so termed are uated.

Fig. 269 gives an outline of an overdoor of a mple kind taken from a college. The usual le in connection with the measurement for ese is to have the *fascia* in line with the archi-ave plate; but this will not serve as a universal le, even in the case of finishing with archi-aves, as should there occur a somewhat pro-cting capping to the architrave, the overdoor ould be *sunk*-looking, and therefore the circum-ances surrounding the case must often help to decision. But the above rule is generally pplicable.

It also applies in the case of a door trimmed ith pilasters, as the overdoor in that case would ave its *fascia* in line with the front of the llaster-plate, irrespective of the mouldings itred round to form the cap, or in the case of carved cap the rule would obtain, unless the

Fig 270



arving of the cap had a very great projection, hen it might be considered advisable to have a rojecting *break* over each cap, and the remainder f the fascia or frieze having the ordinary pro-ection, according to rule; which breaks would ive the finishing a bolder and more prominent ppearance. This rule also determines the length f the overdoor, as the *return fascia* shows the ame margin from the architraves at the ends as n front. It is hardly necessary to give the plan f the overdoor, but a front view is shown in ig. 270, in order to give a better understanding of the dentils, which are formed of pieces accurately fitting the concave surface of the upper portion of the cornice moulding adjacent to the bead, or rounded projecting edge of the top *member* of the cornice.

The dentilling is parallel in thickness, and is glued to, having been cut into lengths, and having had the end grain neatly planed, so as to show a finished appearance when varnished.

It may be well to state that the overdoor, which is being described, was of pitch pine, and, as stated above, varnished. As to the method of *getting up* this overdoor. The explanation will serve for all such finishing, as far as the ground it covers, although it will be necessary to add a little for additional features. A plain board of the required length, width, and thickness is obtained and prepared. Usually, when the wood is valuable, the portion covered by the cornice moulding is of a cheaper class, yellow pine being often substituted. A joint is shown in Fig. 269, a little above the bottom edge of the cornice moulding, which is intended to illustrate the jointing of the yellow pine to the pitch pine. The exact length being known, as per rule given above, the ends are *returned*, and be it understood that the best *return* is the piece at each end—that is, the piece for the fascia should be of the length to make the front and two return ends.

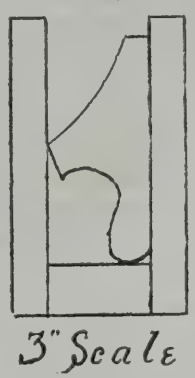
Fig. 271 shows two methods of returning the ends. That on the left hand shows the mitre grooved, and a cross tongue fitted and glued in. The grooving can be done with a *stiff* saw at the circular-saw bench, the mitre sliding on the table, and its sharp outer edge passing along the fence to give the distance. This process to be carefully and accurately done, and more especially, as might sometimes be the case, if the fascia is veneered. A block may be glued in the angle if it would not interfere with any arrangement for fixing; but it is seldom that so much projection is given to the fascia as to make this necessary. It is presumed

Fig. 271.

the piece for the fascia has been thicknessed; in a machine shop this would be case, and otherwise, if not thicknessed throughout, it should be at the ends to suit the returns. The second method, shown on the right-hand side, is by gluing and screwing on a piece so as just to glue the return piece against; the gluing of the edge of this piece and the mitre will serve to hold the returns, provided the wood is dry. It will be noticed that this piece screwed at the back serves to keep the fascia from warping (twisting), and if the return piece is sufficiently long, screws may be inserted into it through this angle piece, and this will serve to bind all very strongly together. When the glue has had sufficient time to harden, the fascia should be thoroughly cleaned up so as to require only a final touch when the mouldings are glued to it.

Be particularly careful to have the mitre joint showing exactly down the angle, as any defect in that position would show badly. The cornice moulding having been got ready, is now to be mitred; and to do this, a box in which to cut it is required, and of a particular size. This rule will apply for every such moulding, viz., to have the box so that the moulding will be jammed in it in the identical position which it is to occupy when fixed.

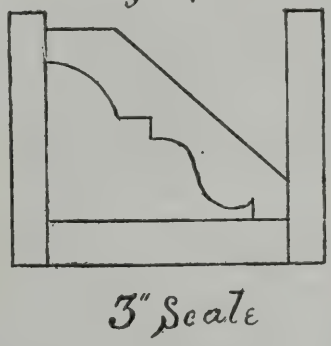
Fig. 272 shows what is meant.



Now, it will be obvious that when the *mitre-cut* is made with the moulding in the position it is to occupy, all that is required is to take a shaving off with the *mitre-plane*, and when the saw-marks are taken off the mitre thus cut, it should make an excellent joint, and will if the work has been accurately done. The *cutting-block* was shown and described in connection with Fig. 113 of this series, and as it is familiar to every joiner, it is not necessary to describe it again; but as this is a special arrangement as regards the size, this has been dealt with.

Fig. 273 gives another end view of a cutting-block with a somewhat common section of a moulding lying in it, and the beauty and utility of the operation are seen with this moulding, as it would be almost impossible to attempt to mitre it other than by a box made specially to fit it, and with, of course, the ordinary mitre cut in it.

This slight digression, or extra explanation, will be pardoned, as it has been somewhat the outcome of preceding matter.



Well, then, be it observed that just as in the fascia it was recommended to have sufficient length to suit the returns, so in the cornice moulding have likewise; and first cut a sufficient

Fig. 272.

length to do one return with the required mitre according to the particular end, then cut the mitre to match that, and having with the mitre plane prepared both these mitres, with the fascia lying on the bench face upwards, place the two pieces of moulding in their right position, and see how the mitre fits; if any slight fitting is required let it be done; mark the length of the piece for the front by just drawing the pencil or drawpoint down along the *return*, marking the back of the moulding at the same time. Now just put a slight mark on the upper edge of the moulding in order to guide in adjusting the position of the moulding in the box before cutting. If it has been seen in fitting the first end that a little extra is required in the length for adjustment, well, allow a fraction, and this is a safe method anyhow; but not so much as to cause an amount of unnecessary labour. When both ends have been carefully adjusted to each other, the holes may be bored for the screws, and handscrews fastened on to keep the moulding in position until it has been temporarily screwed to, and the return pieces likewise; then, when all is

Fig 273

ready, glue and screw permanently. It is as well to fasten the front piece first, as the end pieces can be more readily worked with, and a little of a *draw* could be arranged by boring for the screw so as this would take place. It is surprising how much closer a mitre can be made by this process of *drawing*; of course the screw should be tried in and a thorough test made before the glue is put on the mitre. If, when the glue has been put on and the screw tightened up, any deficiency should present itself, take out the screw, scrape off the glue, wash with a sponge dipped in hot water, and before gluing again rub the mitres with chalk, which dries up

any moisture and considerably helps the gluing in many cases. Should it ever happen in the joiner's practice that sap occurs in a joint-edge, then the chalk is especially serviceable. Remedy the defect noticed above, glue, and screw fast both ends. It needs hardly to be drawn attention to, the matter of the screws being of the proper length, so as not to come through to the face side, and that they are placed in the position best suited for holding the moulding to. The *dentilling* requires no further explanation except the mitring at the corners, and as it is necessary that the dentils should intersect at the corners, provision must be made accordingly; and the provision necessary is to have in the bottom of the *cutting-box* a piece fastened in, concave on its upper surface, so that the piece shall be lying in the same position as if it were upon the cornice moulding in order to put the mitre-cut in it. It would be possible to tack a piece along the back of the inside of the cutting-block, so as to tilt it up to its position as if it were upon the cornice; but it would hardly rest so firmly, and would have a tendency to *stick* the saw before the cut was half gone through.

The neck moulding lower down the overdoor will present no difficulty. It may be glued and needle-pointed to when fitted. The top round-edged piece, forming a kind of capping to all, will be easily arranged also. An additional feature may be made of this by gluing pieces on to show an indented edge.

Fig. 274 gives the section of moulding suitable to glue on to form indents. It is seen that one edge is hollowed to fit the round edge of the capping already on, and the other edge rounded similar to the capping. Besides the glue, these pieces may have each a needle-point put through

them to serve as an extra precaution. The moulding down near the bottom edge of the overdoor, which has been termed the *neck moulding*, seems to be the remains of the *architrave*, which occurs in a somewhat similar position in Classic architecture.

In regard to the fixing of this overdoor, sometimes a *tongue* is left on the bottom edge of the fascia, and a groove wrought for it in the architrave or capping. Two or more vertical grounds may be put up by plugging the brick-joints at suitable points, and of course the grounds will have the necessary projection, so that the back of the *fascia* will go hard against them. Strong, light hooks (sprigs) may be driven through the fascia, &c., at convenient places, where they will be out of sight by reason of the shadow case, say immediately above the neck-moulding, and close down upon the architrave, as also between the dentals if the *ground* has been so arranged. No doubt but the decorator can stop up the holes so as to render them almost invisible to the eye, but a little forethought exercised in this and similar case is very commendable.

On Saturday a new organ was opened in the Wesleyan Chapel, Cullingworth. It was built at a cost of over £700 by Mr. J. J. Binns, of Bramley, Leeds.

The county justices of Northumberland have granted a license for an hotel to be built at Hebburn-on-Tyne, principally for the accommodation of visitors to the shipbuilding yards in the district. These premises will be built from plans prepared by Mr. Stephen Piper, M.S.A., of Westgate-road, Newcastle-on-Tyne, at an estimated cost of £4,000.

Mr. J. Thornhill Harrison was engaged for several hours on Friday, at the Scarborough Town Hall, in conducting, on behalf of the Local Government Board, an inquiry relative to an application by the Scarborough Town Council for powers to borrow over £6,000 for the purpose of executing sewerage and street improvements and other public works. The Scarborough Ratepayers' Association opposed by counsel the application, on the general grounds of alleged extravagant expenditure of the public funds by the corporation.

Building Intelligence.

Batley.—New public baths are about to be constructed on the Market Estate from plans prepared by Mr. Walter Hanstock, of Branch-avenue, Batley. The building will face Cambridge-street, and its dimensions will be 126ft. by 134ft. For the most part, the premises will be one story high. There are to be two swimming baths, first and second class. The latter will measure 91ft. by 49ft., with a water area of 75ft. by 30ft. Dressing boxes will be arranged on three sides, and above these there is to be a spectators' gallery. The first-class swimming bath is to be on the Wellington-street side, and will have a water area of 63ft. by 25ft. Twenty second-class and ten first-class slipper-baths, and a set of Turkish baths, with a cooling and dressing room, a first hot-room, second hot-room, a small third hot-room, and a shampooing room, will also be provided. The cost will be about £10,000.

Campden.—A new Roman Catholic church has just been built in this town from the designs of Mr. W. Lunn, architect, Great Malvern. It is constructed entirely, both inside and out, of local stone, procured from the Westington Hill quarries. The church itself is in the Early Perpendicular style. It consists of a nave and aisles, with chancel and south transept; also a sacristy and outer sacristy, and a bell turret surmounting the south transept. A peal of tubular bells will be fixed in this turret later on. The nave is 65ft. by 33ft., with a total height of 40ft. from the floor. The west window is filled with tracery, and enriched with pinnacles and battlement. In the gable end above is a carved niche inclosing a small statue of St. Catherine, of Bath stone. At the east end of the north aisle is the Ladye Chapel, one of the windows in which contain stained glass, designed by Messrs. Westlake, Lavers, and Co. The nave roof is of red deal, the beams being ornamented with carving and tracery. That of the chancel is of English oak, unpolished and arranged in panels. The floors are of blocks of yellow deal, and set in herring-bone pattern. The temporary wooden altar will ultimately be replaced by one in Caen stone, from the designs of Mr. W. Lunn, which will be carried out by Mr. Wall, of Cheltenham. The seats are of deal. The rest of the woodwork is of English oak. Mr. Collins is the contractor.

Gateshead. — New Higher Grade Board Schools in Whitehall-road, Gateshead, were opened on Monday last. They afford accommodation for over 1,000 children, and occupy a site of two acres. The main block, forming the senior school for boys and girls, is 130ft. by 76ft. (⊔ on plan), and at each end are two classrooms with a folding glass screen, so that they can each be made into large rooms 64ft. by 22ft. These end classrooms are connected with a corridor 80ft. by 13ft., in the centre of which on the west side are two classrooms each 32ft. by 20ft. All the classrooms have glass screens next the corridor. On the east side of the corridor are the staircases to the boys' school upstairs, and two open recesses, 20ft. by 15ft., for hats and coats. The upper floor is arranged on the same plan as the ground floor, and is allotted to boys. There is accommodation for 720 scholars. The junior school is one story high, and is based upon the same plan, on main floor a central hall, 18ft. 6in. wide, and hat and coat recess 20ft. by 14ft. The largest classroom is 45ft. by 22ft., and the other three are 30ft. by 20ft. The buildings are of red brick, relieved with stone dressings. The roofs throughout are broken up with dormer gables. Plans have been approved for a laboratory, where science classes will be held. The total cost, exclusive of laboratory, but including site and fittings, is about £10 per head per child. The architect is Alderman Dunn, of the firm of Messrs. Thompson and Dunn, Newcastle, and the contractor is Mr. T. H. Hutchinson, of Gateshead. Mr. William Edlington has acted as clerk of works.

New Ferry, Wirral — Memorial stones of a Wesleyan chapel were laid at New Ferry, in the Hundred of Wirral, on Sept. 3rd. The chapel will have accommodation provided on the ground-floor for about 530 adults in nave, transepts, and chancel. The chancel is fitted with side pulpit and choir stalls, provision being made for communion table on a raised platform. The transepts have been so arranged that, by means of revolving screens, they may be shut off from the chapel, and so form large classrooms. In a tion to these classrooms, a choristers' vestry been provided at the rear, with accommod for about 450 children in school and classr which will shortly be erected. The sty Decorated Gothic, a tower and spire arranged to the right of the main front. A traceried window has been designed in the gable, and all the chapel windows have enr tracery heads. The buildings, except rear e tion, are faced with red rock-faced sandstone Helsby, and the window and door dressing of Runcorn stone. The contract for the portion of the scheme is being carried ou Messrs. Kelly Bros., of Walton, for the su £2,275, from the designs of Mr. Thomas Cubbon, of Birkenhead, whose plans were sel in a limited competition.

CHIPS.

The memorial stone of a Baptist chapel wa in Victoria-road, Fenton, Staffs, on Thursd last week. Messrs. Windcap and Perkin, of Lo were the architects, and Mr. Cornes, of Hanle the contractor. The cost will be about £2,100

Mr. Edwin Oakes, of the firm of Oakes and builders and contractors, Hunslet, Leeds, died suddenly while walking on the Parade at Brid ton Quay on Saturday week. The deceased built himself a house in Sand's-lane, Bridlin Quay, which he commenced to occupy abo month ago.

An inquiry was held at Sunderland Town on Friday, having reference to the applicati the corporation for the sanction of the Government Board to the borrowing of £1,00 the purchase of land for the purpose of public and pleasure grounds. The town clerk expl that the corporation were already possessed of a at Roker, consisting of about nineteen acres, a is proposed to purchase from the Ecclesiastical missioners another twelve acres, which immedi join the beach, for £1,000.

Additional decorative work has just been pleted at St. Paul's Church, Burton-on-Tren the cost of Lord Burton. It consists of the pai of the roofs of the chancel and sanctuary. roofs are composed of a series of small panels those in the sanctuary contain alternately figure of an angel, with raised gold wings nimbus, and the sacred monogram on a shield the chancel panels the subjects are the cross-sw the letter "P," and the crown, the emblems o Paul. The work has been carried out by M Powell Brothers, of London and Lincoln, und supervision of Mr. G. F. Bodley, A.R.A.

A new Salvation Army citadel in King-s Peterborough, will be opened next month. O front portion of the site, shops, with suit offices above, have been built, the contracto this portion being Mr. Hipwell, of Wis Behind these is built the citadel, which is with red brick and stone dressings. It is 70 41ft. inside measurements, and, by the use very deep gallery, will seat nearly 1,000 pe Mr. Maine, of Loughborough, is the contracto the citadel building.

St. Michael's Church, Lichfield, has been rest and will soon be reopened. The walls o chancel, which were covered with plaster, been restored to their original condition, and fine east window replaced. The masonry o tower has been re-pointed, and decayed s replaced. The clock and dial have been raised an old window opened out. The stair turre been made good, so that the battlements can be reached.

Herr Glückel, an architect of Vienna, who taking a tour in the Austrian Alps, and is k to have ascended the Hoch König, near Bisc hofen, without a guide, has been missing August 19.

The Countess of Leicester laid, on Monda Burnham Thorpe, North Norfolk, the prin stone of a public hall which is being erect that parish to the memory of Nelson, who was there in 1758, when his father was rector. Th no memorial in the place to Nelson, and the fir parish church is being restored at a cost of £1 The hall forms part of the entire scheme.

Messrs. S. and E. Bentley, contractor Leicester, have withdrawn their tender, whic been provisionally accepted, for the carrying of the York Sewerage Scheme. Mr. Bottoms weeks ago broke the contract for reasons stated.

The contract of Mr. Thomas Bell, of M Weighton, for the construction of the Easing Waterworks, is approaching completion. Th a steady flow of water, which will be turne the reservoir in about a fortnight.

COMPETITIONS.

Glasgow.—The executive of the Glasgow sociation for the Promotion of Art and Music ve issued the conditions of the preliminary petition for the proposed art gallery and er buildings in Kelvingrove Park. Architects invited to submit sketch designs for build- s intended to provide accommodation for a tral hall, art galleries, museum halls and leries, a school of art, refreshment rooms, . There will be two divisions of the com- ition—a preliminary one of sketch designs n to all; and a final one, limited to those o may be invited to take part in it. It is ected that the central, or music, hall should be principal feature, its floor space being not re than 12,000 square feet; that the suite of galleries should provide not less than 2,000 eal feet of wall surface, in saloons measuring more than 45ft. in width; that the museum ls and galleries should possess, if possible, 000 square feet of floorage, disposed to allow spacious display of sculpture antiquities, neral art collections, technological and gineering exhibits; and that the school of art ould, if possible, possess a floorage area of 000 square feet. The sum at disposal is 20,000, and the committee do not wish to eed that sum. Mr. Alfred Waterhouse, A., has been appointed to act with the com- ttee as assessor, and with his advice the com- ttee will select six from the designs in the liminary competition, whose authors will be ited to take part in the final competition. ch of the architects so invited will receive hundred guineas, except in the case of the cessful competitor, whose premium shall rge in his commission of 5 per cent. for carry- out the work. All designs must be sent in 1st December next, addressed to Mr. Water- use, at the City Chambers, Glasgow. The day sending in designs in the final competition ll probably be 31st March, 1892.

Kendal.—A competition has recently taken ace here for additions to the town hall, com- ising court room for petty and quarter sessions, d county court, with retiring room and rary, witnesses' rooms, &c.; also council amber, with mayor's parlour and four com- ttee rooms, offices for borough treasurer, rough surveyor, medical officer of health, niment rooms, &c.; also, for the borough lice: two offices, constables' room, and three lls; for the county police: superintendent's ice and two cells. The assembly room is also be enlarged, so as to seat 800 to 1,000. At e request of the Corporation of Bury, Messrs. eming and Leeming are to act as assessors in e matter.

Providence, R.I.—The State of Rhode Island about to select a design for its new State-house Providence, by a process described by the *merican Architect* as "very nearly a model mpetition." Messrs. Hoppin, Read, and oppin, and Messrs. Stone, Carpenter, and Vilson, and W. R. Walker and Son, of Provi- nce, and Messrs. Carrère and Hastings, McKim, ead, and White, and J. C. Cady and Co., of ew York, and Messrs. Shepley, Rutan, and oolidge, of Boston, have been invited to submit signs. For each design which shall be rtified to by the expert architects who will sist the Commission, as complying with the nditions of competition, one thousand dollars ill be paid, provided that its author shall have ade no attempt to influence the decision of the ommissioners or their advisers, and that it shall ppear that the probable cost of carrying it into xecution will not exceed by more than 25 per nt. the limit of one million dollars (£200,000 early) fixed by the conditions; but the property the plans still remains in the architects sub- itting them, and they are only to be used by greement with their authors and further com- nsation. From the designs furnished which nform to the conditions, one will be selected, hich will be presented to the General Assembly the State as the design for the new building; t this design will still remain the property of e architect or firm who made it, and is not to used unless such architect or firm is employed carry his plan into execution according to the ules of the American Institute of Architects. s the Commissioners are only authorised to esent a plan, but not to engage an architect, ey were unable to bind the State to employ the emiated competitor.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., L., LI., LIII., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Constant Reader. (1, 2, 3, 4. Registration of designs is obtainable at the Government Patent Office, Southampton-buildings, Chancery-lane, where all particulars can be obtained. It is best to employ a patent agent. The principal patent agents advertise in the English Mechanic, and any of them will send full particulars on application. You cannot register architectural designs. You can *patent* architectural plans, but it is as yet doubtful if such a patent is of any service. 5. There is no remedy for the piracy of architectural designs.)—Fred T. (Only "Granny's" way! When her chicks are six months late, she always declares her eggs were laid in some other nest.)

Correspondence.

THE JAMES WHITE, OF OVERTOUN, STATUE.

To the Editor of the Building News.

Sir,—In your report of the unveiling of this statue in your issue of 22nd ult., you refer to the statue as "the last work of the late John Mossman, of Glasgow." Sir James King, who performed the ceremony of unveiling the statue, is responsible for this statement, he having in the course of his speech said: "This beautiful work of art is the last work of Mr. John Mossman." Had Sir James looked at the base of the statue before making his speech, he would have observed cut in the bronze the name "Frank Leslie, Sculptor."

The facts of the matter are as follows: The committee gave the late Mr. Mossman the commission to make this statue. My client, Mr. Leslie, was Mr. Mossman's right-hand man—indeed, had been connected with Mr. Mossman for thirty-five years at the time of his death—and the entire work of modelling the statue and everything connected with it was done by Mr. Leslie. When Mr. Mossman died, Mr. Leslie took a studio for himself at 180, West Regent-street, here, and the committee being anxious that the work commenced and carried through, so far, by Mr. Leslie should be finished and erected by him, he made an arrangement with Mr. Mossman's trustees, whereby he took over his own handiwork, and has now brought it to a successful conclusion.—I am, &c.,

A. Stewart Picken.

163, St. Vincent-street, Glasgow, Sept. 7.

A CORRECTION.

Sir,—I notice in your issue of to-day's date, and under the heading "An Incident in the Building Trade," that you have erroneously stated that the foundations of the new Admiralty Buildings in Whitehall were carried out by Messrs. Mowlem and Co.

As the work was executed by my firm, I shall be obliged if you will kindly make the necessary correction in your next issue.—I am, &c.,

William Webster.

8, St. Martin's-place, Trafalgar-square, London, W.C., Sept. 4.

[We apologise for the obvious slip.—Ed. "B. N."]

CHIPS.

A new building, comprising dispensary, baths, &c., has been erected at Swindon for the Great Western Railway Medical Fund Society, and special attention has been paid to the ventilation, the extraction of the vitiated air being effected by the latest improved form of Messrs. Robert Boyle and Son's patent self-acting air-pump ventilator.

The Manchester corporation recently sought to obtain a site for artisans' dwellings, and offered for a block of old property £21,000. The owners declined this, asking £64,000. The matter went before an arbitrator, whose award, taken up last week, amounted to £38,000.

Cheltenham has, says the *World*, been bereft of a theatre ever since the octopus-like Ladies' College swallowed up the old theatre some two years ago. During the past few months Mr. Matcham has been building a new one endowed with a gorgeous Louis XV. interior, and Mrs. Langtry will open it on the 1st proximo.

A banquet was given on Tuesday night by the chairman of the Oldbury local board, to celebrate the completion of the new public buildings which have been erected in Freeth-street, adjoining the public hall. The block of buildings comprise a boardroom, committee rooms, free library, reference library, reading room, and also offices for the accommodation of the public officials. The total cost, including the site and furniture, is between £6,000 and £7,000. The architects were Messrs. Wood and Kendrick, of West Bromwich.

Mr. William Landless, architect to the Leeds School Board, has been appointed by the School Board of West Hartlepool to act as assessor in the competition for the Newburn board school.

The restoration of the tower of St. John's Church, Yeovil, is now almost complete, and the re-hanging of the peal of eight bells, together with two new ones added, is now being proceeded with. The restoration of the tower and bells will cost over £1,000.

The new Ebenezer Congregational Church at Chatham, which is being reared on the site of the building destroyed by fire last winter, is so far advanced that the memorial stones were laid on Wednesday week. The architect of the new building is Mr. G. E. Bond, of Chatham, and the contractor is Mr. C. E. Skinner, also of Chatham. The outlay in reinstatement will be about £6,425.

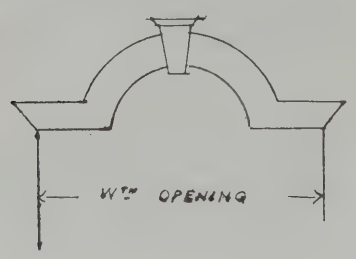
The Three Horse Shoes hostelry at Ramsey, Hunts, which was burnt to the ground in March last, has just been rebuilt from designs by Mr. Ruddle, architect, of Peterborough. The new front is of red brickwork, and has three gables, in each of which is a Bath stone panel carved with a raised horseshoe. Mr. A. J. Bateman, of Ramsey, was the builder.

The parish church of Dartford, Kent, will be re-opened, after restoration and partial rebuilding, on the 25th inst.

Some workmen were engaged on a building in course of erection at Pontywain, South Wales, on Monday, when the scaffolding collapsed, drawing with it the end of the building. Samuel Hicklas, of Newport, was buried in the débris, and killed. Mr. Evans, the contractor, was injured.

Manchester is not so rich in architectural features of interest that it can afford to destroy the few characteristic buildings it possesses, and it is to be regretted that the corporation of that city, unmoved by the appeal of the local Society of Architects, backed up by Mr. Waterhouse, have finally determined upon the demolition of the 18th-century tower of St. Mary's Church in Deansgate.

The Wesleyan chapel in Old King-street, Bristol, was reopened on Sunday after renovation carried out by Messrs. W. Cowlin and Son, from the designs of Mr. Herbert J. Jones, also of that city. The ventilation is by Messrs. Robert Boyle and Son's improved air-pump ventilators.



Intercommunication.

QUESTIONS.

[10621.]—**Fan-Tracery Vaulting.**—Will a kind reader name some books, or book, wherein I shall find good examples of the method of setting out and drawing of fan-tracery vaulting, for which I shall feel greatly obliged?—Groining.

[10622.]—**Surveying.**—Will some reader kindly tell me how to set out a straight line with the theodolite? How am I to proceed when it is necessary to move the instrument, and also to continue the line over a high embankment?—Student.

[10623.]—**Brick Arch.**—I want to construct an arch as shown by sketch, without the use of an iron bar.

Would some reader kindly inform me how to do so? A similar arch was, I think, given in one of the back numbers, but after long-continued searching I am unable to find it.—E. H. W.

[10624.]—**Cream-Colour Wash for Portland Cement.**—Could any of your readers recommend a colour-wash for outside cement work (Portland)? I want to get a cream tint. Any suggestions from practical experience would be thankfully received.—H. B.

REPLIES.

[10611.]—**San. Inst. Exam.**—Messrs. Knight and Co., Local Government publishers, have issued "A Practical Guide for Inspectors of Nuisances," price 4s. 6d. (second edition, 1891.)—Officer.

[10615.]—**Hot-Water Engineering.**—Has "Inquirer" read all the articles? If the cylinder is on first floor, and so far removed from the range as to require 41ft. of double pipe (primary flow and return), there is every probability that the chief feature, the safety of the cylinder system, will be lost, as a draw-off may have to be taken from the primary flow below the cylinder. It may be assumed that taps are required down on the range level at the scullery sink, &c., if so, these could hardly be taken from above the cylinder up on the first floor. There is no particular limit to the length of the primary flow and return so long as it does not do away with the destructive features of the cylinder system—viz., that no draw-offs (except the special emptying service) be taken from below the cylinder. That the cylinder be in a warm position. That the nearer the cylinder is to the boiler the more rapidly its contents will become heated. If warmth be needed in a linen closet, then it is far better to use a small coil in the way that will be fully described presently. Certainly cover exposed primary flow and return pipes—great benefit will result.—The Writer of the Articles.

[10616.]—**Hot-Water Engineering.**—Replying to H. Stream, the question he puts is not very clear, as his reference of "A to B" cannot be understood. If he wishes to know what is the maximum distance may extend away from the secondary flow, then the writer cannot say, as he has not discovered a maximum distance yet. An apparatus just completed with the fire, boiler, and cylinder as referred to, has the secondary return extending 161ft. in an almost straight line before it makes a turn to approach the secondary flow again. This apparatus works perfectly, even though the highest point of erection is not 18ft. above the cylinder, and there are one or two other features more conducive to harm than good, so far as results are concerned. In this case these good results were noted before the pipes were covered; by covering them with a poor heat-conducting material, a benefit equal to at least 25 per cent. must be experienced. With the pipes uncovered, the last draw-off in the return near the cylinder did not yield very hot water with such an extensive run of pipe as this, particularly as the cooling influence was considerable, the pipes being in stone corridors. With the pipes really well covered, the last draw-off service would yield water nearly as hot as the first one.—The Writer of the Articles.

[10618.]—**Greasy Marble.**—"Querist" should try a mixture of two parts washing soda, one part pumice stone, and one part chalk; these should be finely powdered, and made into a paste with water. Rub well over the mantelpiece, and finally wash off with soap and water.—A. A.

[10618.]—**Greasy Marble.**—There are many ways of taking grease out of a white marble mantelpiece. A good plan is to apply whiting or fuller's earth, satuarated with benzine; allow it to remain on the marble some time, then wash off.—Journeyman.

Extensive alterations are about to be made at the Palace at Peterborough for the new Bishop. Mr. H. M. Townsend, of that city, is the architect.

It has been decided to place a stained-glass window in the parish church of Enniskillen to the memory of the late Mr. Quinton, C.S.I., who was killed at Manipur, and a memorial brass in the large schoolroom at Portora Royal School, Enniskillen.

WATER SUPPLY AND SANITARY MATTERS.

Bradford Waterworks Extension.—The Bradford Town Council, at their meeting on Tuesday, adopted the recommendations of the Waterworks Committee for a modification of the scheme for obtaining water from the Nidd Valley. The present engineer, Mr. J. Watson, has come to the conclusion that it is desirable to deviate from the original scheme as prepared by Mr. Binnie. Mr. Watson's modification, which can be effected without any additional expenditure, consists of an alteration of the level of the gathering conduit, so as to enable the water to be delivered to reservoirs at Bradford by gravitation. The change will reduce the area available as gathering ground, but it will obviate the necessity of having to resort to pumping-stations to get the water to the higher parts of the town. For the purpose of his plans, Mr. Watson divides the Bradford district into three zones, each with its own district of supply. Under this method, the waters of Upper Barden, Lower Barden, and Chelker reservoirs would be used on the low-level zone; the water obtained from the Nidd valley would serve for the middle zone; and the Thornton Moor and Stubden supplies would meet the needs of the high-level zone. Another advantage of the amended scheme would be that the distance to be traversed by the water will be reduced by about seven miles, for Mr. Watson intends to tunnel through Rainstang, instead of going round Middlesmoor, and to make the tunnel through Greenhow Hill at a higher altitude, which will have the effect of shortening it. His scheme provides for two service reservoirs at Chellow Heights, each having a capacity for 30,000,000 gallons, with filter-beds capable of dealing with 18,000,000 gallons per day, and a clear water-basin for 2,250,000 gallons.

Guildford.—Mr. Arnold Taylor, a Local Government Board inspector, held an inquiry on Wednesday, at Guildford, into the application of the Town Council for sanction to borrow £35,000 for sewerage and sewage disposal, and into the propriety of constructing outfall works in the district of another authority. Opposition was offered to the site of the proposed outfall works by the Guildford Rural Sanitary Authority and Highway Board, and by the tenant of an adjoining farm; but they did not object to the drainage scheme itself. Mr. Sparkes, C.E., of Guildford, suggested that several of the surrounding villages and the borough of Godalming should be asked to unite with the borough of Guildford in the scheme as a matter of economy, but the Inspector called his attention to the Lower Thames Valley scheme, which cost a deal of money, and ultimately had to be abandoned in favour of separate schemes for the different localities.

CHIPS.

At the monthly meeting of the Llanelly local board, held on Monday, the question of new municipal buildings and town-hall was discussed, and after a protracted debate it was decided that a public meeting be held to consider the question.

The new opera house at the Winter Gardens, Southport, was opened on Monday night. The new opera house faces Lord-street, and occupies the site of an older hall. Exclusive of the value of the site, and of the material obtained from the demolition of the hall, the cost has amounted to £20,000. The architect is Mr. Frank Matcham, of London. The stage is 50ft. deep, 80ft. wide, and 60ft. high. The building is lighted throughout by electricity and gas.

The death took place on Saturday evening of Mr. James Howarth, of the firm of Howarth and Co., ventilating engineers, Farnworth, near Bolton. Mr. Howarth was the inventor of the archimedean screw ventilator, which has worked a revolution in ventilation science, and for his invention was made a member of the Academie National de Paris.

The Portsmouth Town Council decided on Tuesday to adopt the electric light, and agreed to borrow £60,000 to cover the cost of the site and machinery.

Among the receiving orders announced in Tuesday's *London Gazette* the names occur of Thomas Vincent Herbert Davison, of New Malden, late of Windsor, architect and surveyor; and Richard Thomas Elsam, of Kingston-on-Thames, also an architect and surveyor.

The alterations to the Lyceum Theatre, which have been in hand since the close of the season in July, are now complete. A new wide exit leads from the pit into Wellington-street. A new wide staircase leads to the upper circle and amphitheatre. The gallery has been almost doubled in size. A new way has been made to the stalls on the south side, and the footlights and the entire auditorium have been provided with electric light, in place of gas.

Our Office Table

An animated discussion on the eight h question took place on Wednesday at the T Union Congress at Newcastle-on-Tyne. A posal was made to omit from the resolu introduced the previous day, the eight h limit for an international day, on the ground the English Government would be hamper dealing with other countries; but the Con rejected the suggestion. An amendment then moved declaring that eight hours l lation should be permissive, and applicable to any particular trade at the request of thirds of its organised members. The propos was passed, and became the substantive lution. A debate followed, and ultimatel amendment was carried making the propose apply to all trades, except where a majori members objected by vote.

On Monday next a show of water-c drawings by deceased artists will be open the Gallery in Whitworth Park, Manch It includes 47 pictures that are already property of the Institute, 67 lent by Mr. Taylor, 27 by Mr. James Orrock, 12 by the ham Corporation, 37 by Sir John Pender, Sir J. D. Linton, and one—a very fine one Mr. Cash. One of the 47 Whitworth draw a J. R. Cozens of much historical value, has given to the Institute by Mr. J. E. Taylor remainder are presented by the guarantors o Jubilee Exhibition. Turner is represente 20 examples, William Hunt by 17, Cox by Cozens by 8, George Barret and Varle 7 apiece, Müller by 6, Prout and Girti 5 each, Sandby the Elder and de Wi 4 each, and Copley Fielding by 3; and ther also works by Bonington, Sir Augustus Cal Cattermole, Clennell, Constable, Cristall, Da Glover, Havel, Hearne, Leslie, Linnell, L sedge, Martin, Munn, Roberts, Robson, landson, Clarkson Stanfield, and Stothard.

The Hornsey Local Board have acq about eight acres of picturesque and well wo land for the extension of their pleasure ga at South Hornsey. As the property was to be laid out for building, the board autho its chairman (Mr. H. R. Williams) to neg with the owners with a view to its purchase it has now been secured for the sum of £5 and is now being inclosed with iron ra previous to being laid out as a public recre ground. The newly acquired property co some fine trees, and extends from the exi pleasure gardens at Hornsey to Crouch End is situated in the midst of a district whi being rapidly covered with houses. The ac tion of this property, although of some limited area, will be a lasting benefit t neighbourhood, and it is to be hoped tha H. R. Williams will be equally successful i efforts he is making to obtain the bea grounds of the Alexandra Palace as a p park for the use and enjoyment of the peopl

It seems extraordinary that no building responding either to our National Gallery, Kensington Museum, or British Museum which artistic objects of all kinds could be h and displayed, exists in the city of Washing but attention is called to this strange fact b issue of a pamphlet by Mr. Franklin W. S entitled a "Propaganda for the National Ga for Washington." Mr. Smith, who was for a merchant in Boston, and has been for 40 an enthusiastic collector, suggests that a hu acres of gallery space should be set apart museum, and the site be covered with buil to be executed in concrete.

Elie Delauny, the well-known po painter and mural decorator, died on Saturd his house in Paris, aged 63 years. He st under Lamothe and Hippolyte Flandrin, a 1856 won the Prix de Rome. On his retu Paris, a number of remarkable works, so which are now at the Luxembourg, "The munion of the Apostles" and "The Plag Rome," gave him a position in the foremost of contemporary painters. He will, howeve best remembered for the fidelity and charac his portraits. Ten years ago he publishe remarkable illustrations of La Fontaine. A same time, he was busily engaged in an of Paris in the decoration of churches and buildings. His works are to be seen i

pelle des Dames de la Visitation, in Sainte ie at Nantes, his native city, and in Paris at t François Xavier, the Church of the nity, the Hôtel de Ville, the Panthéon, and Opéra. He was a member of the Institut de nce.

HE most perfect lightning protection is said e secured when the building is virtually in a allic cage, the parts of which in connection the earth are thoroughly connected with the st stratum. At each corner of a large ding there should be a conductor of sufficient as to take the greatest possible discharge of electric current. It should have a factor of ty. A ½in. iron rod is supposed to be ample he rod is connected to water or gas-pipes, or a moist well, or pit filled with coke or tin p. Very few buildings, we fear, are pro- ed on this principle. The electric current is to meet with an obstruction in the descent of e improperly-fitted conductor, and make a age through ill-protected and poorly-con- ing masonry to some metallic fitting in the rior; hence the serious damage sometimes cted. The fixing and arrangement of the ductor on properly understood principles are ntial to the protection of a building. The ent will take the path of "least resistance," chever that be, whether the rod or the build- and its contents.

wo pictures recently purchased by the tish Board of Manufactures have just been d to the National Gallery collection at Edin- h. The more important of the two is a k which is attributed to Karl van Mander the ger—a son of the Flemish painter and er of the same name. The son flourished he 17th century, and became Court painter to Danish King. This work is a cabinet por- of two well-attired youths. On the right he figures, for background, there is a marine . The other picture is a small work by enburgh, who, born at Utrecht in 1586, ied in Italy, where his style was largely enced by the Italian masters. The subject Venus and Adonis." Of neither painter was e until now an example in the National lery of Scotland.

BULLETIN of the United States Census De- ment shows that in 1889 the total amount of alte produced in the United States was 51,735 t tons, valued at £34,300. Of this California duced 47,968 tons, and Utah 3,163 tons; st the whole of the remainder came from tucky. Nearly 500 tons, however, were ined from the gilsonite of Utah, and this is to be the purest yet found, containing 90 cent. of bitumen in the crude mineral. The fornia deposits of Ventura country are in a minous rock, containing 24 per cent. of men and about 64 per cent. of silica, with e of iron and calcium carbonate. The ter part of the supply of asphalte comes from idad and the deposits of Seyssel, in France, Val de Travers, in Switzerland. Cuba fur- es excellent asphalte, and large deposits are rted to exist in Tabasco, Mexico. The im- ation of asphalte into the United States menced in 1869, when 185 tons, worth 2dols., were imported. This quantity in- sed until in 1889 61,952 tons, worth 163dols., were imported. Of this 52,881 tons e from Trinidad. The imports of bituminous stone from Neufchatel and Seyssel amount to t 200 tons annually; and about 150 tons of milar material are imported from Hanover Brunswick. During 1887-90 about 6,000 of bituminous limestone were imported from ly and used in street paving. The number quare yards of Trinidad asphalte pavement in the United States is now 6,803,054, reas in 1880 there were 100,838 square yards n. About 72 per cent. of all the Trinidad alte imported is used for street paving, 24 cent. is used in asphalte block and tiles for ements, and 3 per cent. for roofing. The l area covered by bituminous limestone pave- ts in European cities is given as follows:— lin, 681,486 square yards; London, 360,000 re yards; Paris, 357,360; other cities, 000—total, 1,698,846. This is equivalent to t one-fourth of the area covered by asphalte ement in the United States, and less than was in the States in 1890.

HERE are 413 species of trees found within limits of the United States and Territories, en of which, when perfectly seasoned, will in water. The heaviest of these is the black ironwood, found only in Southern Florida, which is more than 30 per cent. heavier than water. Of the other fifteen, the best known are the lignum vitæ and the mangrove. Texas and Mexico are the homes of a species of oak which is about one and one-fourth times heavier than water, and which, when green, will sink almost as quickly as a bar of iron. It grows only in mountain regions, and has been found westward as far as the Colorado desert, where it grows at an elevation of 10,000ft.

CHIPS.

For the past few days some important excav-tions have been going on under the old city walls at Chester. The point at present receiving attention is to the west of the north gate. Already four inscribed stones and several pieces of sculptured and architectural monumental stones of great interest have been discovered. All, it is believed, date further back than the 5th century.

A portion of the railway which is being built by an English company, and which will place Gibraltar in communication with the rest of Europe, was opened on Monday. This section, which is forty-five miles in length, connects Bobadilla with Ronda.

The result of the second and limited competition which has taken place in Berlin for the erection of a monument to the Emperor William I. is far from satisfactory. The present Emperor has awarded the first prize to the design of Herr Karl Hilgers, granting, however, almost immediately afterwards to the other competitors—Herren Reinhold Begas, Bruno Schmitz, and Johannes Schilling—money prizes of exactly equal amount with that given to the victor. It is very doubtful whether the premiated design will be carried out.

The members of the Durham and Northumberland Archæological and Architectural Society visited, on Friday, Richmond Castle, the church at Gilling, and the church and castle at Kirkby Ravensworth.

At the Wigan Police-court on the 3rd inst., John O'Niell, builder, of Darlington-street, in that town, was fined 10s. and costs for receiving corporation water knowing it to have been stolen. When a building inspector visited a site on which defendant was building he found that water was being drawn for the works from a tap in a private house.

According to the annual report of the Commissioners of Inland Revenue more than one-third of the whole annual value of houses and messuages in England and Wales is to be found in London, and more than one-fourth of that of the United Kingdom. The annual value for London last year was £35,155,593, and for the United Kingdom £138,589,982. Land improved slightly in value, both in the Metropolis and in the country generally; but in most of the purely agricultural counties there was a further decline.

The widening of the Great Western Railway between Waltham and Maidenhead is being rapidly proceeded with. All the bridges are being widened, and a new goods station is being built at Maidenhead. Mr. Mackay is the contractor for this section of the work.

Under the title of "A Model Museum," a correspondent of the *Times* describes the collection of local antiquities brought together by General Pitt-Rivers in a disused school at Farnham, a North Dorset village. The museum is opened freely on Sundays and during the week, and was visited last year by 6,500 people.

Another stage has now been reached in the scheme for providing baths and washhouses for Woolwich, the local board of health having received tenders from builders for the purchase and removal of the building materials of the houses and premises now occupying the site in Market-street, Upper Market-street, and Lower Market-street.

On Sunday night a policeman found Mr. Frank Whitby, builder and contractor, of Bradford, about fifty years of age, and residing at 41, Mildred-street, lying across a footpath. On being raised, he was found to be dead.

The Plymouth town council decided on Wednesday to erect memorials commemorating the departure of the *May Flower* from Plymouth and the battle between the Roundhead and Cavalier forces. The first of these memorials will take the form of a tablet, fixed in the pavement on the Barbican Pier, mentioning that the Pilgrim Fathers embarked from there September 16th, 1620. The other will consist of a pedestal placed in Freedom Fields recording that "on December 3rd, 1640, the three Roundhead garrisons of Plymouth made their final rally and routed the Cavalier army, which had surprised the outworks and well-nigh taken the town."

An important scheme of railway improvements at Belfast, involving, if executed, an expenditure of three-quarters of a million sterling, is under consideration. Sir Frederick Bramwell is the consulting engineer.

Trade News.

WAGES MOVEMENTS.

EDINBURGH.—A meeting of Edinburgh journeymen upholsterers was held on Friday night at the Labour Hall, South Bridge-street, to consider the question of amalgamation with the societies of England and Ireland. Mr. Gabriel Wallace presided. Mr. A. Haldane moved a resolution pledging the meeting to do all in its power to increase the membership. He commented upon the fact that the membership of the society only amounted to two-fifths of the number engaged in the trade in the city. Mr. T. Walker seconded and Mr. G. Mackay supported the motion, which was unanimously carried. Speeches urging the need of immediate combination were also delivered by Mr. Cossar, and by Mr. Purdie, chairman of the Trades Council. — The quarterly meeting of the Edinburgh Masons' Federation was held on Friday night at the Moulders' Hall. A small balance in hand was reported. The members on the roll were 392. A member stated that things were looking better for the men. On a certain job at Morningside a further increase of a farthing had been given without being asked for. This showed that the generally-improved state of trade in the country was raising the wages independently of agitation.

THE CARPENTERS' STRIKE IN LONDON.—The United Trades Committee have issued this week a manifesto, giving a retrospect of the dispute, and expressing a determination to continue the struggle. Support, it is stated, is greatly needed, as there were still 3,500 men on the strike roll. At the Trades Congress meeting at Newcastle, on Tuesday, after hearing Messrs. Bowern and Matkin, the delegates of the United Trades Committee, a resolution was unanimously passed expressing sympathy with the London carpenters and joiners in their struggle. Mr. Richard Day, of Manchester, chairman of the Amalgamated Society of Carpenters and Joiners, is on a visit to London to see for himself the arrangements made by the committee. At a meeting held at the White Hart, Belvedere-road, Lambeth, on Tuesday night, Mr. Day stated that the Amalgamated Society were prepared to keep their men out on strike for two years if necessary, and that cablegrams had been received from India, Australia, and America, where the society has branches, that levies had been made in support of the men locked out and on strike in London, and that the money so collected was being sent to England.

New G. N. R. schools for boys, built at New England, Peterborough, at a cost of £500, were opened last week. Mr. Johnson, of the G. N. R. engineer's office, prepared the plans, which are of the Queen Anne style, and are an elongated H on plan. Messrs. Bell and Son, of Nottingham, were the builders.

Holloway's Pills completely cleanse the blood, expel all oppressive accumulations from the bowels, and purify both solids and fluids. With the blood perfect, and all poisons purged from the system, regularity must prevail throughout the body, aches and pains must cease, healthful energy must supplant weariness, and the shaky nerves must regain their wholesome tone.

CRAIGLEITH STONE.
UNEQUALLED for Staircases, Steps, and Landings, especially for Public Buildings with great wear.
VERY HARD, and NEVER WEARS SLIPPERY.
SOLE AGENTS for England,
J. & A. CREW, Cumberland Market, London, N.W.

BILLS OF QUANTITIES & PLANS.
T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 23, Frith-street, Soho, London, W. Established 50 years.

HAM HILL STONE.
The attention of Architects is specially invited to the Durability and beautiful COLOUR of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.
Address:—
THE HAM HILL STONE COMPANY,
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent:—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

DOULTING FREESTONE.
THE CHELYNCH STONE.—The Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.
THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.
Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

ACTON.—For constructing first portion of new road and sewer at Acton, for Mr. E. J. Edwards. Mr. C. R. Maddox, F.S.I., Warwick-court, Gray's Inn, surveyor :—

Rowles, M. W.	£979 0 0
Nowell and Robson	669 0 0
Serff Bros., and Co.	665 0 0
Cronin, D.	623 13 6
Catley, A. T.	620 0 0
Warner and Co.	588 0 0
Parry, E.	580 0 0
Tomes and Wimpey (accepted)	580 0 0

ASHFORD, KENT.—For the erection of a house on the Beaver Estate, Ashford, for Mr. W. E. Pledge. Mr. H. J. Jeffery, M.S.A., architect :—
Conley, G. C., Folkestone (accepted).

ASHFORD, KENT.—For the extension of Christchurch-road, laying in main drain, and forming the footpaths, Beaver Estate, Ashford. Mr. H. J. Jeffery, M.S.A., estate surveyor, architect :—

Knoch, H., Ashford	£420 0 0

BARRY.—For Park Hotel, Charles-square, Barry, for the Park (Barry Dock) Building Co., Limited. Mr. W. H. D. Caple, architect :—

Jenkins and Arnold, Barry	£2,674 0 0
Stephens, Bastow, and Co., Bristol	2,597 0 0
Shepherd, C., and Son, Cardiff	2,475 0 0

BLACKHEATH.—For erection of stabling at Blackheath, for Mr. T. Tilling. Messrs. Jarvis and Sons, architects :—

Nicholls	£4,303 0 0
Brass and Sons	4,283 0 0
Hart Bros.	4,169 0 0
Higgins, F. and H.	3,900 0 0
Burman	3,750 0 0
Jerrard	3,689 0 0
Barker	3,652 0 0
Kennard Bros.	3,651 0 0

BANHAM, NORFOLK.—For the repair of the schools, for the Banham Board School :—
Kettle, A. (accepted).

BLACKPOOL.—For a shop and dwelling-house, Lytham-road and Springfield-road, for Mr. G. H. Holmes. Mr. J. Horsfall, Todmorden, architect :—
Accepted tenders.
Masons and bricklayers :—Butterworth, S., and Sons, Blackpool.
Carpenter and joiner :—Sutcliffe, J., Todmorden.
Slating :—Baines, S. and J. W., Todmorden.
Plumbing :—Coulston, J., Blackpool.
Plastering :—Hodgson, C., Blackpool.

BRISTOL.—For warehouses, Temple Back, Bristol, for Messrs. F. Clarke and Son. Mr. W. B. Gingell, architect :—

Serle	£3,453 0 0
Wilkins	3,400 0 0
Walters	3,295 0 0
Neale	3,253 0 0
Hatherly	3,204 0 0
Brock	3,050 0 0
Easterbrook	2,998 0 0
Beachem and Balment	2,965 0 0
Perkins	2,898 0 0
Cowlin and Son	2,894 0 0
Veals	2,894 0 0
Stephens, Bastow, and Co.	2,849 0 0
Love	2,775 0 0

BRISTOL.—For the supply and erection of entrance gates at Victoria Park, for the sanitary committee :—
Sampson and Sons, Malago Vale, Bristol .. £1,066 16 10
[Only tender received; the committee will re-advertise for separate tenders for masonry and ironwork.]

CHELSEA.—For pulling down and rebuilding premises for Mr. W. Cosby-Broom. Mr. W. Hunt, 5, York Buildings, Adelphi, W.C., architect :—

Downs, W.	£1,080 0 0
Turtle and Appleton	1,048 0 0
Wall, C.	1,045 0 0
Nightingale, B. E.	948 0 0
Knight, S.	890 0 0
Eyears	847 0 0
Somerford, H., and Sons	799 0 0
Bulled, E. P., and Co. (accepted)	779 0 0
For machinery :—	
Summerscales (accepted)	583 12 0

FARNHAM, SURREY.—For a steam road-roller for the highway board :—

Aveling and Porter, Rochester	£328 0 0
Wallis and Stevens, Basingstoke*	288 0 0

* Accepted.

FOLESHILL.—For the erection of board schools :—
Garlick and Co. (recommended for adoption) £2,8[illegible]0 0 0

FOLKESTONE.—For rebuilding to wider span the gi bridge carrying the South-Eastern Railway lines Radnor Park-road, for the town council, the Kent co council, and the South-Eastern Railway Company :-

Shaw, M. T., and Co.	£7,581 0
Ridley, T. D.	5,719 0

(Engineer's estimate, £4,000.)

FRADDON, CORNWALL.—For the erection of bus premises and cottages at Fraddon, near St. Columb-station. Mr. W. J. Samble, of Fowey and Par, a tect :—
Julian, J., Truro (accepted),

KENNINGHALL, NORFOLK.—For works of repair painting to the board school :—
Kettle, A. (accepted).

KENNINGTON, E. KENT.—For the erection of a h for Mr. S. Williamson in Church-road. Mr. Jeffery, M.S.A., architect :—

Knoch, H., Ashford	£410 0
Wood, J. Ashford	400 0
Peters, W. G., Kennington (accepted)	400 0

LINCOLN.—For the supply of wood blocks for s paving, each 9in. by 4½in. by 3in., for the city counc
Burt and Roper (accepted), 96s. per thousand.

LINCOLN.—For alterations and additions to the Cl House, Lincoln, for the committee. Mr. W. Wat F.R.I.B.A., architect :—

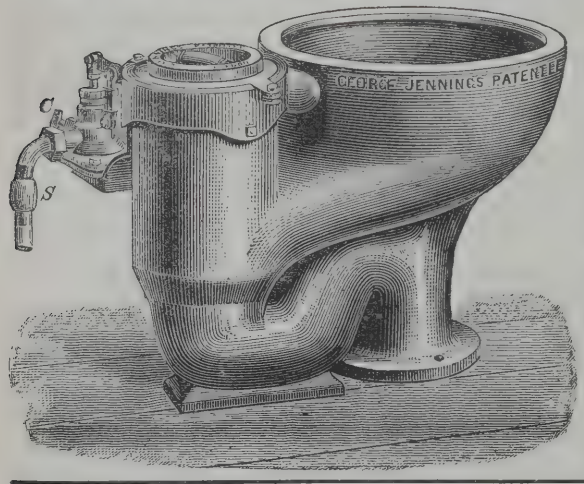
Wright, W., and Sons	£1,390 0
Close, H. S. and W.	1,294 0
Otter, M., and Co. (accepted)	1,267 0

All of Lincoln.

LONDON.—For alterations to the Coach and H 4, Dover-street, Piccadilly, for Mr. G. Marshall. M Seckham Witherington, F.R.I.B.A., 79, Mark-lane, architect :—

Drew and Cadman	£1,597 0
Laing, D., and Son	1,595 0
Lark, W. G., and Son	1,530 0
Kearley, C. F.	1,498 0

LONDON.—For alterations and additions to the shops at the workhouse, Marloes-road, W., fo Guardians of St. Mary Abbotts, Kensington. Mr. Aldwinckle, F.R.I.B.A., 2, East India-avenue, Le hall-street, E.C., architect :—

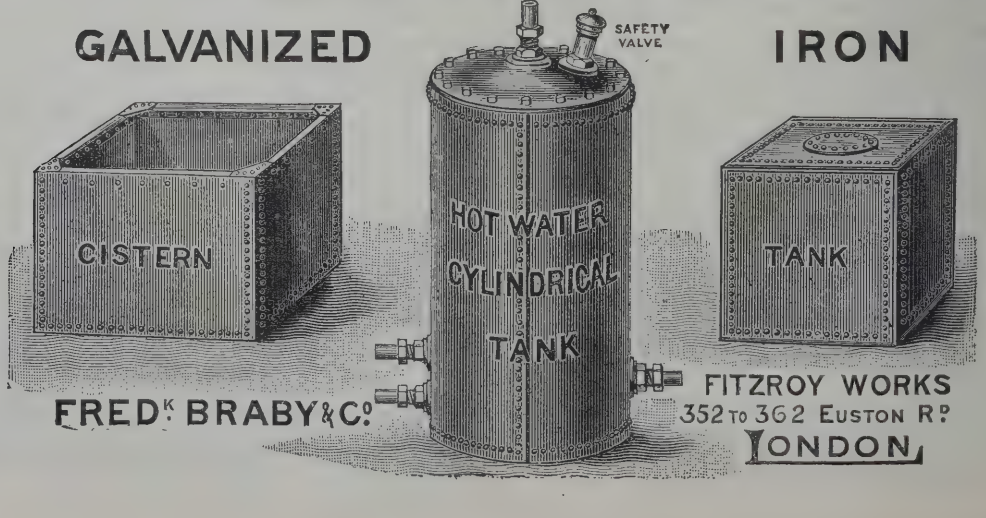


Williams and Richards	£978 0
Flow and Co.	949 0
Johnson, W., and Co., Limited*	875 0

* Accepted.

LONDON.—For the completion of warehouse pre Nos. 35 and 37, Hoxton-street, N. Mr. F. G. Gri 9, Old Jewry-chambers, Cheapside, E.C., architect :

Voller, F.	£520 0
Lea, H. and E.	495 0
Courtney and Fairbairn	473 0
Pocock, J.	433 0
Watts, C. (accepted)	398 0



JENNINGS' PATENT VALVE CLOSET & TRA
IN ONE PIECE OF STRONG GLAZED EARTHENWARE.

OVER 100,000 NOW IN USE. Fixed in all the principal MANSIONS, CL HOTELS, RAILWAY STATIONS, HOSPITALS, BARRACKS, ASYLUMS in all parts of the world. The CLEANEST and MOST EFFICIENT of the day, free from complication; adapted for buildings of all classes, public and private the latest improvements, new Service Valve, Ball Overflow Discharge and base under Trap, ensuring the maintenance of a perfect connection with soil-pipe.
This Closet can be arranged with waste-preventing valve mechanism, or with his Imp Waste-preventing cistern, either of which secures the necessary after-flush to the "JENNINGS' extra long drawn-lead Bend" should be specified for connecting the ou this Closet with soil-pipe.
Architects specifying any fittings "to be obtained from George Jennings" can rely on se most satisfactory results for their clients, and as a guarantee of efficiency, all arti his manufacture bear the Name and Address,

GEORGE JENNINGS, STANGATE, LONDO
Illustrated Catalogues forwarded on application of latest improvements in
Lavatories, Baths, Urinals, Sinks, Sanitary Appliances, Water Fittings of every description.

CONTRIVANCE IN PLANNING.

TILFUL planning has not been regarded as an art by English architects, and has equently received far less attention as a cular branch of study than the ortho- hical design of buildings. One reason his neglect is that art has been more rally associated with the elevation or nal architecture; another, that the onic mind, being eminently practical in abits, has turned its attention to utility f primary importance. Fergusson, in nteresting handbook, has instructively n the connection of the history of archi- re with the four great races of mankind, Turanian, the Semitic, the Celtic, and Aryan, and it is as well to bear this ion to ethnography in mind. We all that the mental peculiarities and ous predilections of these races have materially influenced the development architecture, as indeed of all the and religious creeds, and it is ny of notice that all great archi- tres have been mainly developed by rst three of these races—the Turanian, emite, and the Celt. Both the Turanian he Celt were great temple builders and tects, as we know from the remains of t and India. They possessed a high of form and colour. The same sense portion and symmetry distinguishes the nes or Greeks, in whose blood there ertainly an infusion of the Turanian or We may be sure of one thing: that ic plan was strong in these earlier races, practical planning and design were ties which marked the Aryan. What ean is, that the artistic function of plan be attributed to a race which is not gly represented in this country, and the xture of Aryan blood has predisposed English architect to look at archi- re as only a practical art, and that fore planning, as an artistic study, been disregarded. The Turanian or was always artistic, as we know from rt and poetry of Arcadia, while the n was prosaic. Plan has been quite uch affected by these influences as

prevalence and persistence of Gothic is country has contributed much to plan a subsidiary means of effect. rn Gothic architects, by studying pic- ue grouping, have made their plans to heir external design. Many notable tions to the rule may be cited, as in 's Houses of Parliament, Mr. Water- 's Manchester Town-hall, Street's Law s; but the general tendency of Gothic been to place utility of plan before c arrangement, and to ignore any ple of planning. If we take instances recent competitions for public build- it is obvious to anyone who has ned the designs submitted that the est plans have generally accompanied cal or Italian Renaissance designs. er observation will be made. The plans have not been the work most skilful artist. While Mr. A roduced by far the best and most arrangement, his elevations are and poor in detail. On the other the artistic elevation or perspective of y a man who has sent in a very ill- l plan, with badly lighted corridors hurried scheme of arrangement, as if n was commenced at the last moment. This strange anomaly or inconsistence is only to be explained by the fact that invention in planning is not always accompanied by a corresponding ability to conceive an artistic elevation, though, as a matter of fact, it will be found that the lack is not being able to express the external design, and due to imperfect education as an architectural draughtsman, rather than to want of natural ability. All the time and labour have been given to the plans, and, conscious of a good scheme, the author neglects what he considers of less importance. Unfortunately, this consciousness of inherent merit is lost. An unappreciative committee or a superficial public do not recognise it. A clever perspective wins where a truthfully drawn elevation is passed by. Those who know the "ropes," however, manage things differently. If they have made a good "hit" in the plan they retain the services of an expert draughtsman, and the design has then a double chance of winning.

What are the principles of good planning? Does it consist in some good luck in hitting upon an arrangement that is happy and economical—a kind of fortuitous working out of a puzzle which comes to one only a few times out of many? A great many would appear to think so—that it is quite a matter of chance or luck. Others will admit that clever planning is a gift; that Mr. "Knack" has a head for arrangement; his plans are always clever—an admission which recognises that there is a knack in planning, as there is in chess-playing or draughts, and this knack is another name for discerning rightly, seeing at a glance what is needed, and the best way of doing it. The born "plannist," in fact, like the born artist, has the power of arranging: he can distribute his rooms or departments in proper relation to each other, and has the skill of placing them in some method that appears simple and direct, and at once commends itself even to the brother competitor, who readily acknowledges, if he is frank, that he has been beaten. The question immediately occurs, What are those methods or principles which the skilled planman at once perceives and works upon? We do not affirm that skilful planning can be taught by any set of rules, as this is impossible; but there are some principles to be found observed in all good plans. What these are we will endeavour to point out.

The best instruction in plan-design is that of examining a number of designs for any kind of building, such as we meet with in a competition. By comparing the good and the inferior plans, we begin to discover what the strong points are in the good and the weak points in the mediocre plans. We shall find invariably that the poor plans are distinguished by looseness; that they are rambling and straggling; the corridors are long and crooked; the apartments thrown here and there without any connection. The salient mark of the good plan is invariably compactness and coherency. Again we look further. We find a method in the clever plan. If there are principal rooms or departments they have been consigned to positions having some distinct relation to the site; they are prominently located along some axis, or brought to play an important part in the general design. The inferior plan has no such method or principle apparent. Comparing again the plans, we find a waste of ground in the inferior set. Here there is a large space wasted in a corridor or area; but perhaps the entrance is cramped. If the site is irregular, it is ten chances to one the author has lost space along the curved or oblique boundary, that the blocks are made to follow the boundaries, and that the angles are not at right angles. The expert plannist has taken care to make his main frontages, if possible, square, so that the main walls should be parallel, and this he does because he knows the bad effect of crooked roofs and towers if their sides appear so on main façades.

These, at least, are some of the characteristic differences which distinguish weak from strong plans, and we may here resolve them into certain well-defined principles. I.—Compactness or coherency. By this we mean that there should be no waste space in entrances, corridors, or areas; that corridors and passages of communication should be shortened as much as possible; that the main apartments should be near to and have easy and direct access from the entrance hall; that the other apartments should be so arranged that no more additional walls should be made than are absolutely necessary, and the subsidiary offices be made as coherent to the main rooms as possible. II.—Simplicity. Under this head we may place axial distribution of the principal rooms or blocks in relation to the plan of site. Disregard of this principle is painfully manifest in competition plans. To take three or four recent instances: The Sheffield municipal offices, the site for which was a trapezium, only showed two or three attempts to make an axial arrangement. One of these we published, by Mr. Tulloch, in which the council-chamber was placed centrally, but the design of Messrs. Flockton and Gibbs was entirely planned on this principle, and showed central axes at right angles, the rooms and areas being placed in reference to them. The Bury Municipal Buildings, which are intended to be built on a triangular site, exhibited a few well-considered axial plans in which the police-court or council-chamber was placed in the central axis with the entrance. In the competition designs for the completion of South Kensington Museum, the site and requirements called for an imposing entrance and hall, and in the premiated design by Mr. Aston Webb, we have a great European court and entrance hall in the main short axis, intersected by the long axis parallel to the main road, along which are placed the lateral European courts, and at one end the Oriental court. Mr. Emerson, Mr. Collcutt, Sir T. N. Deane and Son, Mr. Jackson, and Mr. Young have all placed their main entrance and hall on a central axis, though they have not all preserved the principle in the other departments. In plans for irregular sites, this principle is rarely found, as only a few skilled in planning can see where to locate an axis with any advantage. Thus in the Southampton Free Library Competition, only one competitor has adopted this principle.

Another element is Economy (III.) How to make the most of a central hall—that is, to get as many distinct entrances to departments as possible from it—is the question? When a large hall is simply a meeting point for several corridors, it is often wasteful of space. Again, two large apartments separated by a single wall is a more economical mode of planning than to place each in a separate position. Wasteful arrangements of corridors and offices are common, and so are areas for light. But the principle of economy is only learned after some experience, and depends mainly on the principle of compactness. Much space is lost in dealing with irregular boundaries. The novice is an adept at making crooked corners and leaving spaces. He generally places his blocks parallel to the oblique sides, and in thus disposing of them creates an irregular area in the centre, spoiling the interior of perhaps a hall or some apartment. The contrary process is the course resorted to by the skilful artist. The economical designer boldly makes his main blocks parallel to one principal street or boundary of the site, or assumes an axis, to which they are made parallel. The irregular corners left between the main building and the raking boundaries are thrown out on a rear or inferior side of the area, are filled up by subordinate offices,

and are left simply as areas of triangular form for light and air.

Direct and easy access, well-lighted corridors, suitable proportions of apartments, and that architectural *finesse* which distinguishes the masterly from the crude attempt, are other characteristic elements of a clever plan, to each of which we may refer; but these are details which follow from attention to the foregoing principles.

TRADE COMPETITIONS.

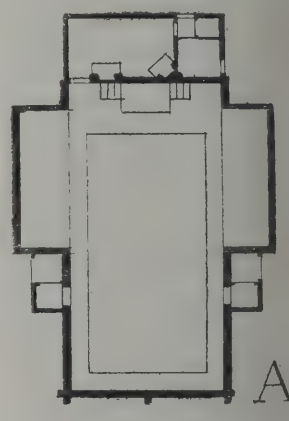
TRADE competitions have become useful means of inculcating the principles and methods of design as applied to the treatment of materials. The Worshipful Company of Plaisterers have lately offered the sum of £25 as prizes for proficiency and skill in the art of plastering, and an examination is to be held by the City and Guilds of London Institute, consisting of two grades, in May next, particulars of which examinations we published in our issue of August 28th. The syllabus for the ordinary grade will consist of questions on different limes, sand, stucco, plaster of Paris, cements, and other materials used in the trade, and candidates for the Honours grade will be required to pass a written examination, and produce examples of practical work. These questions will embrace tests of quality for limes and cements, quantities of material for covering a given area, setting out ceilings for applied ornaments, running a moulded oval of certain major and minor axes, columns with an entasis on a brick or studded and lathed core, mitring coves; also description, with specimens, of either sgraffito work or modelling in stucco, besides a knowledge of other processes, such as mouldings, gesso-work, scagliola, carton pierre, &c.

The practical questions given relate to matters about which every plasterer should be a proficient. Many able men engaged in this craft are, it must be confessed, ignorant of the qualities of limes and cements, and the uses to which they should be put. A certain amount of chemical and mineralogical knowledge is very necessary in dealing with limes. Their hydraulic and non-hydraulic qualities, modes of slaking, and their admixture with sand are points which the ordinary plasterer has only a slight and "rule of thumb" acquaintance with. The artificer knows that ordinary mortar hardens by exposure to the air, partly by drying and partly by the absorption of carbonic acid; but probably he does not understand why plaster of Paris (sulphate of lime or gypsum) is so valuable for its setting or solidifying quality, or why it is so useful for moulding purposes. The gypsum burnt and then ground is anhydrous, and when mixed with water quickly takes up the water it has lost in burning, and is thereby converted into a hard substance, which expands and fills accurately the mould. Why greystone lime is better than chalk lime is also because of a chemical reason—the absorption of the carbonic acid from the atmosphere is slower. Again, the workman knows that the stronger the lime the more sand it will take, the slower the setting the harder the mortar becomes; but the *rationale* of the action is not understood. He knows the effects or results, but cares very little about the causes. Technical education is supplying this deficiency. We shall have more capable bricklayers, masons, and plasterers when these rudiments of the laws which govern their trades are known—that is, laws in relation to materials used. But there is a knowledge of other laws equally important to the master craftsman—those which relate to the design and application of materials—artistic laws, and we confine our present remarks mainly to these.

Happily the modern art of plastering is reviving, though it has scarcely yet attained the position it acquired during the 16th, 17th, and 18th centuries. We know, for instance, that the Duke of Wurtemburg visited England in 1598, and was astonished at the beauty and excellence of English plaster-work; and in this connection we may notice the eminent stuccoist John Papworth, who studied the Italian style. We have few modern ceilings that surpass those introduced by the Italian artists in buildings erected by Gibbs, Adam, and Chambers. The last century was famous for its ceilings, but many of these have of late disappeared. Those who know Audley End can study the state of the stuccoist's art in the middle of King James's reign, 1616. The grand ceiling of the large saloon, with its pendentives and elaborate friezes, are pretty well known. Crewe Hall exhibits also some remarkable specimens of decorative plaster work, which are well worth study. These and other examples, to be met with in English cities, are evidence of the considerable attention bestowed on this branch of architecture, especially by foreign artists. There is need for more of this study now. The Plaisterers' Company have instituted a useful course; students are required to make drawings of old ornamental work in stucco, besides specimens of modelled stucco. But specimens and drawings are not the only things necessary. What we require is a school of stuccoists or plasterers who have acquired the principles of their art in a practical way. The isolated specimens of sgraffito, friezes, and ceilings would be of more value if the student were required to show their relation to an actual building. Relative proportion or scale of relief can only be learned by observing the effects of height above the eye, distance, and those of light and shadow. For example, the modelled stucco-work for a hall ceiling with lantern can only be appreciated by seeing it in position. A medallion, a cartouche, or a frieze, must be modelled and seen *in situ* under the varying effects of light and shade. The plaster decorations of a dome should be taught with reference to scale; the modeller ought to be able to produce a specimen appropriate to each position, the frieze or cornice, the ribs and panel, the zones intermediate between the springing and crown, and the crown itself. These attempts might consist of mouldings simply, and ornaments showing the different degrees of relief required. At one time painter and stuccoist worked together, and were united in one person, as in the case of Pierina and Toto, who worked in stucco and in painting. Toto was engaged at Nonesuch in 1539. But this higher province of the art does not now concern us. The profession would be glad to be assured that their designs in plaster or stucco were intrusted to artists who have studied the artistic branch of their vocation, and who could assist in realising the intention of the designer by having made themselves masters of modelling, and the effects of bas, mezzo, and alto-rilievos under different conditions of distance and light.

NONCONFORMIST CHURCH BUILDING.*

By JAMES CUBITT.



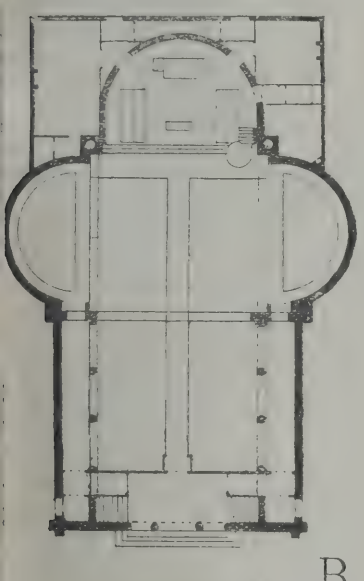
CHAPTER III. (*continued*).

2.—FORM OF PLAN.

NEXT to the question of cost, that of planning needs consideration, for on this the adaptation of the building to its purpose very much depends; and in judging of a plan, the first thing is to see whether its inventor means his building to be a galleried one or an ungalleried one. The two things usually require—though unfortunately they do not usually obtain—quite different types of arrangement, and a type that would answer admirably for the one, may miserable failure for the other.

(*a*) *Plans Suitable for Un-G Churches.*—Suppose, then, that the ch to be without galleries, or with m small end-gallery, which can be fi most forms of plan. The simplest ty plain oblong, roofed in one span, v columns. Such a structure, 60ft. lo 30ft. wide, will seat about 300 adults ground-floor area. And it is poss give beauty and interest even to a based on these simple lines. But, fo larger congregations a plain colu oblong becomes rather unmanageab rather expensive. It cannot be lengthened, or the furthest seats w too far from the pulpit. The only alte is to widen it; but a wider building r greater height, or it will look squat like, and out of proportion. And greater height, too, the side windo not be tall enough to light the cen perly. But greater height implies th for greater strength in the walls. width implies the need for greater s in the roof. Both these things and which result from them, mean e And greater height, conjoined with width, implies much greater space ov for the preacher's voice to fill, and much risk of echo and reverberation. The of all this is that a limit is soon rea the useful employment of plain columnless plans.

An easy way of adding to the cap an oblong plan, without introducing c is to form shallow recesses or trans one or both sides of the pulpit. Thi forms the oblong into an L-shaped shaped plan, or into a cruciform o

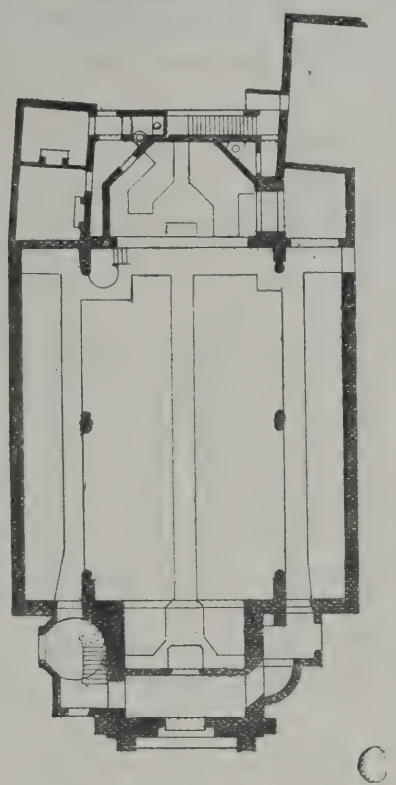


that sketched at A.* In this way the of sittings can be brought up to rather more. But the transepts sh resemble, in depth and narrowness, ancient churches. If they do, the pants are not likely to hear well. only so, but the loss of sound in the t and the reflection of the voice from the transept walls which face the will be almost sure to make the re interior an acoustic failure.

So far, it has been assumed that th ing contains no columns; and, se the absence of all obstacles to se hearing is so especially desirable in conformist church, it is natural th should ask, as they often do, why cannot be dispensed with altogether is clearly no mechanical impossibili it, for in large towns we see everywh with a wider span than that of an And it may be at once admitted ecclesiastical designs, columns ha been used where, for mechanical they were needless. Men, however live by mechanicalism alone. Mo

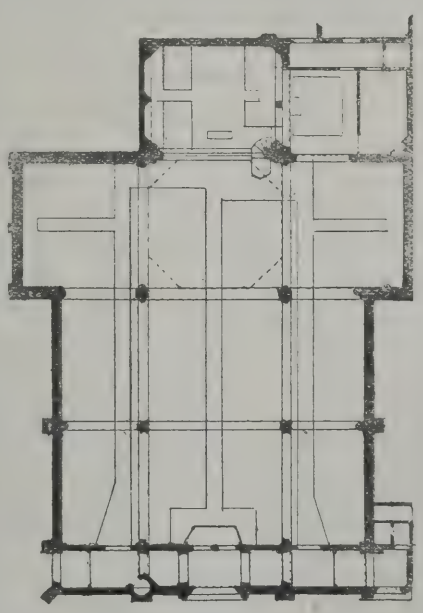
* The buildings to which these sketch plans with the exception of that marked B, been designs by the author.

* All rights reserved.



appreciate, more or less acutely, such
;s as beauty of proportion and grace of
. Were it not for this, it might seem
:al to build for a great congregation
vast unpillared ellipse, like the Albert
or some enormous one-span oblong,
St. Pancras Station. Yet, even then,
unrelieved mechanicalism might defeat
. It does not follow that where there is
)struction to sight there will be none to
l, and these great columnless buildings
a way of breaking to the ear the pro-
they make to the eye.
the other hand, it is quite possible to
olumns without allowing them to inter-
vith sight, and so used they may become
.ble aids to construction, to acoustics,
o artistic effect. The primary advantage
lumns is this—that they allow a build-
) be made wider without being made
ir. We have already seen how in a
pan church the walls need to be raised
) width increases; how the brickwork,
nasonry, and carpentry all have to be
gthened in consequence; and how the
which the voice has to fill tends to
ase much more rapidly than the area
ied by the congregation. Suppose, for
nce, to take an elementary illustration,

B



we begin with a building 45ft. long,
wide, and, on the average, 25ft. high
e. This will contain 1,125sq.ft. on the
nd floor (seating, say, nearly 200 people),
ts total contents, or the amount of air-
) which the voice has to fill, will be
,5c.ft. Now, to keep the same pro-
ions, and to seat four times as many
le, the building must be twice as long,
) as wide, and twice as high—that is,
by 50ft. by 50ft. It will then contain
)sq.ft. of floor-space, or four times as
h as at first, and will seat nearly 800
le. But its total contents, instead of
g only four times, will be eight times
) of the original example, or 225,000c.ft.
means, as regards expense, that the cost
sitting of the larger building will be
ly double that of the smaller one; and
ans, as regards acoustics, that the strain
ie speaker's voice will be twice as great,
oportion to the number of sittings, as
) is any need for it to be. If, in practice,
) results are to some extent avoided, they
voided by abandoning proportion, by not
ng the walls sufficiently as the building
ns, and by being content with a squat,
inly, and frequently ill-lighted struc-

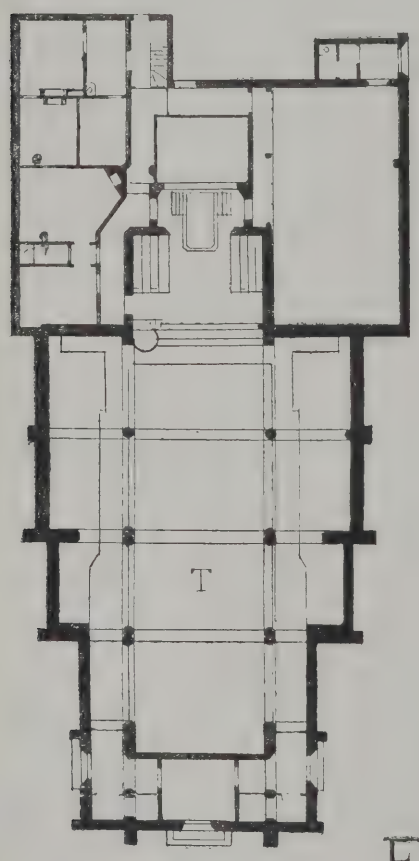
, on the other hand, columns are intro-
d, the building can be widened without
g increased in height, and it will preserve
ie same time sufficiently lofty propor-
tions. The columns effect this by dividing the wide span into two or more narrower spans, each of which, because it is narrower, will both look and be sufficiently high. In this way, again, they assist acoustics. The larger building (which we are supposing all along to be ungalleried) need not, with

C

columns, be much higher than the small one; and thus its contents, or the cubic feet of air-space which the voice has to fill, do not increase much faster than the number of people provided for. Columns, too, if well placed, will do very much to break up those

D

echoes and reverberations from the wall-surfaces, which, more than almost anything else, render a speaker unintelligible. They greatly facilitate roof construction, by allowing two or more roofs of moderate span to be substituted for one of wide span. And they are valuable aids to architectural effect, both external and internal: in the one case, by giving apparent height, and also variety; and in the other, by doing away with the dreary, unbroken expanse of slating, and by allowing an endless variety of picturesque arrangements, which would be impossible without them.

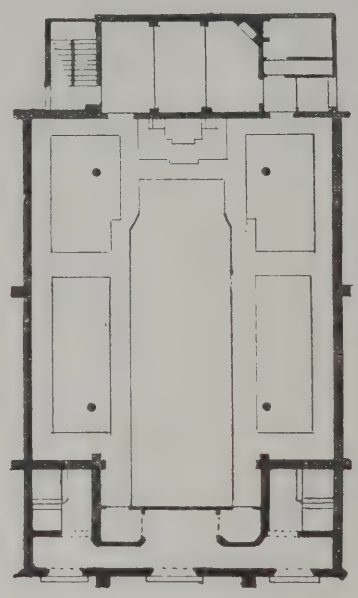


If, in our larger buildings, columns have these advantages, the question for the architect is how to place them so that they shall not obstruct the view of the pulpit. It has already been shown (in Chapter II.) that, for plain reasons of public safety, unprotected iron columns ought not to be tolerated in churches of any considerable magnitude. They require a thick casing of concrete, or of some similarly fireproof substance, and when thus cased they necessarily become large enough to cause considerable obstruction to sight. If stone columns are used, they will do the same; and, in either case, a committee, before adopting a design, should ascertain clearly from how many sittings the view of the pulpit will thus be seriously interfered with.

To find this out, it is only necessary to take the ground plan (and the gallery plan, if there is one); to stick a pin in the front part of the pulpit; from this as a centre, to rule lines touching the two sides of each column, and then continue these lines to the further end of the building. Between these two lines, behind the column, the view of the pulpit will be interfered with; and it is easy to measure, by means of a scale, how many sittings will thus be injured. Two or three facts, however, should be borne in mind. It does not matter, in ordinary cases, how much the columns obstruct the view from the alleys, or passages between the seats, since these are, or ought to be, unoccupied during the service. Even in a crowded building, where standing-room has to be provided, it is far better to provide it elsewhere, and to leave the alleys free in case of a panic. Then, again, if a number of columns stand in a row (as in the common "nave-and-aisles" plan of Anglican churches), their sound shadows usually overlap each other; and a large area is thus formed near one corner of the building, from which the minister can neither be seen nor clearly heard. But that is not so where a column stands by itself. In this case it is rather the eye than the ear that loses; and the voice will be almost as audible behind the column as in front of it.

The subject of the present chapter is "The Selection of a Design," not the invention of one; and its purpose is not so much to suggest modes in which architects may overcome the difficulties of Nonconformist church-planning, as to enable committees and others persons interested to judge for themselves whether these difficulties have been overcome in any particular case. But by way of illustration, a few more plans may be given. That marked B shows, for instance, one way in which columns may be used without being objectionable. The pews are confined to the central part of the church and to the two transepts; and the side aisles, where the columns would interfere with the view, are only used as passages. This sort of arrangement groups the congregation round the preacher, and admits of a substantial and even monumental type of building without any sacrifice of convenience. The plan marked C (which belongs to a rather smaller building than the last, though, by an accident in the photographic reduction of the drawing, it looks larger) belongs likewise to the more solid class of work, and has one stone pier and two arches on each side. Here the obstruction from one column goes down the alley, and that from the other only affects three or four sittings. There is a tower, open to the church, at the front end, its lower part occupied by seats and by an entrance porch, and its upper part by a gallery carried on stone arches and granite shafts. In this way the inside of the tower,

instead of being useless, as it commonly is in Nonconformist places of worship, forms a marked feature in the internal view of the building, and contains altogether about 120 sittings.



D is the plan of a church seating 900 persons on the ground floor. The expressed wish of the promoters was for something "very ecclesiastical in character," and hence a modified nave-and-aisles plan was adopted. Only four columns of hard stone and of moderate size, are introduced, so that very little inconvenience is caused by these features, though, at the same time, the division of the building into nave and aisles is strongly marked. The roof is carried, without trusses, on stone and brick transverse arches from pier to pier. There is a large central tower at the crossing of the nave and transepts, and the middle of the nave is lighted by a high clerestory. Externally, the walls are of Yorkshire parpoint, with dressings of Ancaster stone. The church is lined with a kind of buff terracotta brick, and the roofs, which, like the woodwork generally, are of pitch-pine, are covered with tiles.

E

The next sketch, E, shows the arrangement of a building planned to suit a long and narrow wedge-shaped site, lying between a road and a railway cutting. As the site widens out, the building is also widened, and double transepts are adopted, so as to give as much space as possible near the pulpit. Behind the recess for the choir is another recess for the baptistery, and behind this again, but separated by stone screens filled in with wrought-iron grilles, is a relatively large organ-chamber of considerable height. Vestries, and classroom for the use of the Sunday-school, are placed around this part of the church. There is a nave of five bays, divided from the transepts and aisles by stone piers and arches; a low clerestory, and a tower over the middle bay of the nave, at the point marked T. The roofs are carried by moulded arches of stone. Although there are six columns, each 2ft. or more in diameter, there is very little obstruction to sight from any of the pews, and the acoustic properties of the building are said to be particularly good.

Of the five plans described so far, the first is without columns, and the others have, or were meant to have, stone columns and arches. The next, marked F, is one of a cheaper type, in which the internal construction is mainly of wood. Here, however, something of a more solid and permanent character is introduced by the great arches at each end of the

F

central space, dividing off the organ gallery and the end gallery respectively; the latter arch supports a ventilating turret of brick and stone. The wooden columns, four in number, very much facilitate the roofing, both in its external and internal treatment. The ceilings are of wood. The walls are plastered inside, with moulding and piers of a kind of red terracotta.

HOT-WATER ENGINEERING.—XV.

Supply of Hot Water for Baths and Domestic Purposes.

covering tanks and pipes for the conservation of heat.

TO the practical and experienced man there is no branch subject connected with hot-water works that deserves more attention that this. To those who seek to make a hot-water supply apparatus what it is intended to be, viz., a means of transferring the water heated in the boiler to the different points at which the taps are sit-

uated without diminution of temperature, it sometimes produces a feeling akin to distress to see what a great percentage of heat is totally lost by radiation from pipes, and the tank or cylinder.

This waste of heat represents not only a clear loss of fuel, but increased labor, and, what is frequently considered of most importance, greatly decreased efficiency, sometimes a failure entirely. It hardly needs pointing out that the percentage of heat that is dissipated from pipes and reservoirs decreases the heat of the water in an exactly like ratio, and this to no good purpose whatever. It is generally in passages, casings, and, with the tank system, the roof or a cistern room that the heat is lost mostly, and in these places it is least likely to do any good. It has been frequently known that the complete covering of an apparatus (pipes and reservoir) has transformed a decidedly inefficient apparatus into a thoroughly successful one.

If the temperature could be taken as the water leaves the boiler, and then again when it has reached the top of the apparatus, there would in many cases be found a difference of 40 to 50 per cent., even when the apparatus is in working order, and the heat is not abstracted by the metal itself. Of course, it is the metal that abstracts the heat at all times, but the loss to be complained of is when the metal of the pipes is only answering the purpose of a transferring medium for the heat from the water to the air. It is sometimes thought that the passage of water through pipes for 60 to 100ft. must necessarily result in its temperature being reduced, but this is not so, no more than an engineer of steam appliances expects a noticeable loss of heat to his steam when it is conveyed in pipes. A loss would, as a matter of course, be incurred if his pipes were exposed, but they are instead always carefully coated with a poor conducting compound to avoid this loss, which almost amounts to an offence in his eyes. Undoubtedly a time must shortly arrive when a hot-water apparatus will not be considered finished if not covered everywhere to prevent loss of heat.

The material most commonly used for covering both pipes and reservoirs is hair felt. Hair is, as everyone knows, a natural poor conductor of heat and an efficient one, requiring but little thickness to effect what is required and it is not expensive. In covering pipes the sheets of felt are usually cut into strips which are wound on spirally, and securely fastened here and there with string or wire. An error, however, is commonly fallen into in using felt too thin, under the impression that the mere fact of its being the correct material is sufficient. A great quantity is sold 3-16 and ¼in. thick, and this is not enough. To really conserve the heat and only allow of the smallest possible waste, it should be ½in., and, of course, thicker than this would be even more suitable, only that too bulky a covering becomes unsightly and awkward in residence work. If the felt cannot be used in strips and wound on, then it can be rolled round lengthwise, but the appearance is not good.

A good plan, but entailing a little more labour and expense, is to cover the pipes with felt, secured with string; then to wind some strips of closely woven canvas round in the opposite direction to that in which the felt is wound, and then to secure this with wire. By putting on the covering material in sufficient thickness so that no heat is felt by the hand laid upon it when the pipes are charged with hot water, it can be taken that the least possible waste is occurring, and practically all the heat imparted to the water at the boiler will issue with the water from the taps. This is supposing that all parts of the apparatus are covered in the manner recommended, and that its construction is correct.

There is an objection raised to this hair felt in the fact that occasionally it is found to harbour insects. It is not always so by any means, and the trouble can only arise from one of two causes: either the surroundings are conducive to the appearance of these insects, or they come with the felt from the merchant's warehouse. Both causes are unusual, and no hesitation need be entertained in using this material. Those who consider this objection strongly advocate the use of slag-wool (silicate cotton), and the writer is quite ready to admit that this material is preferable, but it is difficult of application. If silicate cotton was woven into sheets of soft felt then everyone would use it in preference to hair and such animal and organic substances. Doubtless it will presently be made in this way, and we may assume that some difficulty in manufacture prevents its being prepared in this manner at present.

Silicate cotton, which is also commonly known as slag-wool, is a waste product from blast furnaces, as the latter name almost implies; it is in reality a glass wool, as the fibres are composed of silica; and as a poor conductor of heat nothing can excel glass. If a short piece of glass is held in a gas flame until one extremity is red hot, the opposite end which can be held between the fingers will be barely warm. There is no surer sign than this that a material conducts heat slowly. Of course, everyone knows that there is no material existing that is a perfect non-conductor of heat. The nearest approach to a felt in which this glass cotton can be obtained is a method in which it is prepared sewn upon canvas in strips 4½in. wide. These strips are nearly ¾in. thick, cotton and canvas together, and necessarily become more expensive than hair felt; but a covering of this material would render the pipes as nearly as possible heat tight.

These strips can be obtained from Frederick Jones and Co., Kentish Town, London, who make a speciality of this material in all forms; and sheet-iron pipe casings can be had for clipping round pipes if the loose silicate cotton is used. The loose cotton is very cheap, averaging about 12s. 6d. per cwt., with a covering capacity of 1,800 square feet 1in. thick.

The chief places at which heat is lost from pipes is in cold corridors and in pipe casings. Sometimes the idea is entertained that to encase the pipes with wood or to run the pipes in the general pipe casing that extends from top to bottom of many large residences is a good plan to conserve the heat. This idea is correct if the casing is tightly packed with some material like hair or silicate cotton, but if it is left empty the result will be considerably worse than if no casing existed, and the pipes were exposed.

To explain this clearly it must be pointed out that to introduce a heated body into a casing, or such chamber of any description, instantly converts it into a flue, having the characteristics of a chimney, which owes its draught to precisely the same cause, viz., a heated interior. Directly a pipe in a casing becomes heated the air surrounding it becomes heated also, and rarefied, and commences to rise, and cold air takes its place, which becomes heated in its turn, and so on; this creates an up-current of air in the casing precisely like the up-draught in a chimney. This, it hardly needs pointing out, is kept up at the expense of the hot water, for the inflowing cold air instantly passes to the hot pipes, robs them of heat, and escapes. An action like this has a cooling influence upon the heated water equal to placing it outdoors in a steady cold wind. The pipes would do much better without the casing.

Packing the casing, of course, obviates this, and although a casing is useful in hiding the unsightly pipes, its chief usefulness is in holding loose packing material, such as hair, sawdust, &c. It must not be thought that the up-current of air induced in a casing can be obviated by closely fitting ends, as there are bound to be fissures somewhere at which a current of air will set in; the heat itself will make them.

We have no more common and obvious proof of the sharp up-current of air that is induced by heated pipes than the black smudge-like marks that appear over pipe casings (even those that are packed sometimes); over the top edge of a cupboard door frame that has a hot tank behind it; and over hot pipes that lie against a wall, &c. This, what looks like a puff of soot, is caused by the air that is impelled upwards carrying minute particles of dirt with it, which are projected against the paint or ceiling and remain there.

It has to be pointed out that a particular objection to carrying hot pipes in the general pipe casing referred to exists in the fact that not only cold water pipes are carried there, and perhaps brought into contact with the hot ones, but these latter may come in contact with a soil pipe, and bring about an objectionable feature of another character. Sometimes men have been known to run their hot water pipes in close contact and secured to the others indiscriminately, fastening them all together with wire, for this general house casing will probably contain main, house, and water-closet cold services and soil pipe.

The most important time at which ho pipes require covering is when circumstanc it necessary to carry them outside the ho this time the covering is absolutely e and it must be done well. Usually it is casing packed with suitable material (s excellent, as most other materials absor ture very quickly), but a common fault pointed out here. If the pipes are run the wall and then encased the packing cannot be very well placed behind th between them and the wall. This woul necessary, as brickwork is as good a p ductor as any almost, but if the casing very well secured, or if the weather af woodwork, it may draw away from th trifle, and, of course, would draw a packing material with it, leaving a clear to the pipes along the surface of t Pipes run on outer walls should be kept little, that the packing material may be behind and so envelop them. If th moves a little, or fissures appear, it will matter very much.

There has been a practice of runni outside pipes within a large-sized r pipe, and then filling in around them w (another good poor conductor, being t material as the silicate cotton, but in a form). This makes a fairly good job, b pairs should ever be needed a difficult ta be experienced.

Of course, every care should be taken outside work, but it frequently become sary when erecting a new apparatus in and occupied residence. As a rule, i when the alternative is to carry pipes the best decorated rooms that they ar outside. In covering outside pipes the material should be at least 1¼in. th should always be encased. The bitte winter nights is what has to be conside

Let every engineer advocate the co the entire apparatus. Few people will the little extra expense when the advan made known. The water will remain night till morning, so that a warm b often be had before the kitchen fire lighted. The saving in coal is really g the majority of petty annoyances conne these works are never known. The between an apparatus covered and un really surprising. The subject, as te complete efficiency, is of much greate ance than is usually attached to it.

THE ARCHITECTURAL ASSO CURRICULUM.

FULL particulars and details of scheme of education to be inaug the Architectural Association next furnished in a little pamphlet issued b secretary, Mr. Ernest S. Gale, of Fal Fleet-street, E.C. The complete cour provided in the Curriculum extends years, and there are in every year t but distinct courses—a course of le classes, and a course in the studio. who is commencing his studies must co first year's courses before taking up t year work, and so on through the f but it is provided that a member w ciently advanced in his studies may t work at the commencement of any yea the courses are principally based on gramme of the R.I.B.A. examina "Regulations" distinctly state that i chief object of the Association to prep dates for these examinations, but to bers to fit themselves for their work as by providing the means by which supplement the training acquired in where they are engaged as pupils or The course can be extended over mor years should it appear desirable. Th of a fee of ten guineas entitles a memb the studio and all the classes and lect one year's course; but any member either the lectures or classes only studio only, on payment of fi for the year's course, and many of the courses can be taken up separately on a special fee. In each of the four ye medal and a bronze medal will be gi and second prizes on the class and l and similar medals will be awar studio side in each year for the best

st sets of drawings or designs produced in the idio during the year. The studio, as was nounced some time since, is located at 56, eat Marlborough-street, W., and the long list lecturers and instructors includes the names Messrs. Cole A. Adams, Henry Adams, H. W. rrows, Max Clark, F. R. Farrow, H. Han-k, R. Holmes, R. Kerr, J. Leaning, T. rling Lee, W. G. B. Lewis, G. T. Moody, W. Pomeroy, Lacy W. Ridge, R. W. Schultz, A. Slater, R. Elsey Smith, E. Prioleau arren, and A. W. Weldon. Messrs. G. chison, J. Belcher, Basil Champneys, Ernest orge, T. G. Jackson, E. J. May, E. W. untford, Aston Webb, and A. Waterhouse ve consented to act as visitors at the meetings the studio for the criticism of drawings. ose desirous of further information as to the ication now so successfully launched should lress their letters and inquiries to Mr. E. S. le, at Falcon-court, E.C.

ARCHITECTURAL PHOTOGRAPHIC EXHIBITION.

O-DAY, at the Royal Architectural Museum, Tufton-street, Westminster, the annual ibition of Mr. John L. Robinson's A.A. ursion photographs has been opened free to public. The collection, consisting of about hundred and forty prints, illustrates the ldings visited by the Association last month Shropshire, so that it may be taken for nted how interesting and useful the assem-ge must be to all who admire old domestic rk of the quainter and richer sort. Our ent detailed account of the places visited, en when we described the proceedings,* leaves need for further remarks on this occasion. ssing briefly through the screens, after noting ne capital large views from Shrewsbury, such the Old Grammar School, now the Public rary, the Abbey Church, St. Mary's, tcher's-row, which Parker describes as the st perfect block of ancient timber shop-fronts sting in England, Hill's Mansion, both front l rear, the Market Hall in "the Square," and hitehall House, we pass a series of excel-t studies of Much Wenlock Priory, including grand ruins of the church and the perfect ient Prior's House there. The Priory Church lf presents an example of 13th-century design ich was never surpassed for beauty of detail l fitness of proportion. The Market Hall in street, with the spire of the parish church to rear, makes a well-known picture. Less niliar are Benthall Hall and Plaish Hall, two houses of rare merit, both well stocked with d furniture and contemporary woodwork, and, e Pitchford Hall, a timber-built mansion, both well cared for. Shipton Hall, another stone idence, is not so fortunate in this respect, and the days of the Georges was sadly knocked out when the interior was recast. Here Mr. binson executed a first-class group of the ursionists before the main entry. Moreton rbet and Haughmond Abbey are very nous; but their parts are uncommonly rich l interesting, and these characteristics are here ll brought out by the camera. The larger ws shown of Stokesay were not improved the rain, which somewhat spoiled the pleasure the Associationists' visit. The Jacobean imneypiece, of which Mr. Robinson has made exquisite picture, showing in reflected light ery detail of its elaborate elevation, is, how-er, perhaps the best and most delicate of the ger series. "The Feathers" at Ludlow ves little to be desired from a photographic int of view, and the pictures of Ludlow parish urch are specially clever and clear. Condover, spite of its dark red masonry, comes out pitally, and the set of big views from Chester thedral, taken by Mr. Robinson on his way me to Ireland, are a welcome addition to the llection. The smaller pictures shown from rewsbury are very comprehensive, and have nsiderable variety. No. 50, as an instantaneous idy of the main street, full of figures and ight in sunlight, is worthy among these of ecial reference, and also the same remark plies to a local police incident, No. 47, in "The uare." Wroxeter and Buildwas Abbey are lowed by some interior work of interest from nthall, Plaish Hall, and Allbright Hussey, hich latter is partly in timber and partly in ick. Acton Burnell Tomb, Church, and Hall make good subjects, and so do Battlefield and Morton Corbet churches. One of the best views is 107, giving a detail of the Chapter House portals at Haughmond. Pitchford Hall, No. 128, is also very good. Where all deserve mention, distinction becomes invidious. The collection will be on view till the first week in October.

* See Building News, Aug. 7, 14, 21, and 28, 1891.

PUBLIC CARRIAGE-WAYS ON NEW ESTATES.

TO builders and owners of estates the decision given in the case of James Edmondson and Son, builders, of North Holme, Highbury, who were summoned before Mr. Haden Corser by the London County Council for unlawfully laying-out a road, passage, or way, known as Newington Turning, as a public carriage-way in such a manner that such road or passage would not directly communicate at both ends with a public carriage-way, contrary to the 53rd and 54th Victoria, cap. 243, is important. For the County Council Mr. Buckmaster appeared, who stated that Newington Turning was a passage which varied in width from about 9ft. to 12ft., and joined two public carriage-ways. The defendants gave notice of their intention to build two houses in a certain position, their object being to widen this passage half-way down to form a carriage-way, leaving the other half of its original width. The Council served a notice upon the defendants to the effect that such alteration was contrary to provision 35 of the London Council (General Powers) Act, 1890, which provides that "No road, passage, or way which will not directly communicate at both ends with a public carriage-way shall be laid out as a public carriage-way without the consent, in writing, of the Council." The defendants had laid out one portion to the full width of 40ft., but had not continued it to the other end, or thoroughfare. It appears that this road was, to a large extent, laid out before this Act came into force, in August, 1890, while the penal notice was served about a month previously. Cross-examination elicited the fact that Newington Turning was a public footway prior to 1878, inclosed by fencing on each side. In 1889, plans and sections showing existing and proposed streets already sanctioned by the Council, and those proposed to be made and widened, were sent, and notice was given that the owners of estates intended to proceed with the formation of certain streets coloured after the expiration of four weeks from date. The plan shows the widening of the passage, and the extension of North Holme-road to meet it. The Council declined to approve of the plan, and it was returned with a request that the dimensions of the roads should be written on it. This was done, and it was then returned to the County Council to be deposited in accordance with the by-laws. The Council asked for a second plan with regard to certain portions of the roads; but the defendants declined to deposit fresh plans. The Council, in fact, rightly or wrongly, declined to approve those deposited, and it was contended by the defendants that no approval was necessary. Evidence further went to show that a public carriage-way in process of formation (Aberdeen-road) running across the top of the turning could be used for carriage traffic, and that houses are built on it. The plan, in fact, showed that if the scheme was carried out the roads will communicate with a public carriage-way. By the other side it was contended that the plan proposed was to lay out a road as a carriage-way that does not communicate at both ends within the meaning of the section. It was submitted by Mr. Buckmaster that there was no indication of any carriage-way from which this proposed carriage-way will lead, except Aberdeen-road; no indication of any intention to use the staked-out strip of land as a carriage-way until building is begun.

The magistrate dismissed the summons, with £5 5s. costs, but notice of appeal was given. In giving his judgment Mr. Corser said: "If it had been intended that all these roads should be laid out at once, then I cannot see why they should have used the word 'will' in the section running 'No road, passage, or way which will not directly communicate.' If the Act had said, 'which *does not* directly communicate, &c.,' that would have thrown on the owners of the land the burden of laying out all the streets before they could have begun to build on any of them at all." But the word "will" "assumes that something is to be done at a future time, and I must give effect to it. That seems to me to be the reasonable way of reading the section of the Act of Parliament. The owner of this land proposed to lay out another road; it happened to be a widening of an existing road or a footway, but that did not signify much; but he proposed to make a new street, which he sent word to the County Council he was going to make, to communicate with the widening of this Newington Turning, and it is laid out in accordance with his letter dated 18th October, 1889. Whether the Council have any right or not to refuse is another matter; but when they got this they got notice that this turning would be extended, and the other road—viz., the North Holme-road—would be extended if the plan was carried out. In my judgment they were wrong in saying that this Newington Turning-road and the North Holme-road would not have an entrance to a carriage-way at each end." . . . . "They had no ground for supposing, except that the fences had been removed then, that this plan was not honestly intended to be carried out, and no ground has been shown me why they should suppose so." . . . . "I am of opinion that it is not shown to me that this road will not directly communicate at some time when the whole of the estate is laid out."

This decision is reasonable. The evidence, briefly stated, was that the portion complained of was only a part of a scheme for covering the estate with houses, that when it was completed Newington Turning would be intersected by another carriage-road. which had already been staked out. On the other hand, the County Council argued that no single house could be erected unless the whole of the estate roads were made up and opened. The point in dispute is one of interest to the tenants of new estates, to all estate owners and builders, as it is the first summons under the section. On this ground a special case was granted.

PATENT REMOVABLE PARQUET.

A PARQUET that can be rapidly and easily fixed to any sort of floor, that is yet not so dependent on it as to be injuriously affected by the unevenness or liability to shrinkage of the sub-floor, and can be removed at any time, is a valuable decorative application. The patent removable parquet, manufactured by Messrs. McKenzie and Co., of 96, High-street, Camden Town, is an invention that secures all these advantages. The parquet is made in sections, which are grooved and tongued with metal, having a metallic back which gives it extreme rigidity and strength when laid. Our readers are aware that ordinary parquetry has to be glued down to the sub-floor by some adhesive composition, and nailed, the result of which fixing to the floor is that any shrinkage of the floor-boards, or sinking, is apt to split the parquet or seriously injure it. We have known many parquet floors irretrievably ruined by the system to which we refer.

McKenzie and Co.'s patent parquet is perfectly free of the sub-floor, is fixed to it by secret nails in a manner that allows any inequalities to remain without injury. The secret of the system is a combination of secret nailing and tongueing. Each square or section of a pattern has a metallic backing of great stiffness glued to it, two adjacent edges of which project about a quarter of an inch beyond the sides of square, which forms a flange, which is nailed by brads to the sub-floor. The two other sides of square are tongued by a metal tongue, which fits into corresponding grooves in the sides of adjoining squares. This system is applied to triangular and other sections of the parquet. The metallic backing insures strength, prevents the squares from splitting or sinking into hollows in the sub-floor; being impermeable to moisture it secures dryness; and lastly, it becomes the means of secretly fixing the parquet to the sub-floor. Each square is thus tongued and grooved to its fellows, besides being fixed to the floor by nails on two sides, and thus the whole parquet floor, when laid, retains a perfectly level and even surface, which cannot warp or twist under any conditions. The unseasoned boards of the sub-floor may shrink without causing the parquet floor to crack. In laying the parquet, only the borders are nailed to the floor along their back edge, the front being nailed through

the flange of metallic backing. An iron tongue is then fixed in the groove, and the squares are fitted in regular order, starting from one angle between two straight sides of room, and finishing where the chimney-breasts and recesses occur. One advantage is that this parquet can be fixed by any joiner or cabinet-maker; no planing or other preparatory process is needed to the sub-floor, and consequently labour and expense are saved.

The examples to be seen at Messrs. McKenzie's factory are varied. We see ½in. oak parquet, with the patent backing for floors to stand more than ordinary wear; but the thickness generally used is ⅝in., including the backing, and as the tongue is inserted nearer the bottom surface of parquet, there is a good substance left for wear above. Several very effective diagonal patterns made in triangular sections (as pattern No. 58 on their illustrated sheet) are to be seen for floors. The "basket" pattern, No. 50, of walnut and oak, makes a very ornamental floor, and is also adapted for dadoes, panellings, ceilings. For more ornamental patterns several diagonal arrangements, Nos. 52, 55, 56, 58, 60, 84, the hexagonal pattern No. 61, are suitable, and these can be made to any size and in any woods. The border patterns are well adapted for rooms, corridors, halls. For those who wish to adopt this patent system of parquet are recommended the "Directions for Laying and Fixing," issued by McKenzie and Co. We saw some very ornamental table-tops made of this parquet. Several of the principal West-End firms of decorators are using this parquet, including Messrs. Trollope, Gillows, Godfrey, G. Giles and Co., H. J. Cooper, Marler, and Bennett, Wylie and Lockhead of Glasgow, and several large residences are about to be laid with it, as that of Palace Court, Bayswater, designed by Mr. W. Flockhart. The prices given for patent parquet are exceedingly moderate, including laying and wax-polishing. No preparing sub-floors is necessary. The prices for ordinary parquet do not show any gain, as extra labour is entailed in preparing the floors. Messrs. McKenzie guarantee the floors laid by them on this system. The fact that the deck of an important steamer on the Clyde has been laid with the patent parquet must be mentioned. For floors and decorative panel-work the patent removable parquet leaves nothing to be desired, and that a floor laid with it can be so easily taken up and relaid is a consideration that will commend itself to everyone who is furnishing and decorating his residence.

CHIPS.

Plans by Messrs. W. and T. Wilkins, of Brecon, have been adopted for a parsonage house to be built at Llanyre, near Llandrindod.

The death is announced from Folkestone of Mr. Donald Nicoll, an ex-Sheriff of London and Middlesex, and formerly M.P. for Frome, and president of the Engineering and Sanitary Association. He was a practical engineer, and was the patentee of a safety road, to be made with granite cubes and an elastic bituminous compound in the interstices.

On Sunday a large stained-glass window, erected in the east end of Chorlton-road Congregational Church, Manchester, to the memory of the late pastor, the Rev. Dr. Macfadyen, was unveiled. The window comprises five large lights with tracery, and the theme chosen for illustration is "The Continuity of the Love of God throughout the Ages." The figures of Moses, David, John, and Paul, with the Saviour (as the Good Shepherd) in the centre, fill the lights, in the order named. The window has been designed and executed by Mr. W. G. Sutherland, Manchester, under the supervision of Mr. Alfred Darbyshire.

The Technical Instruction Committee of the Staffordshire County Council have appointed Mr. Daniel E. Jones, Professor of Physics at the University College of Wales, Aberystwith, as organising secretary and director of technical instruction in the county. The salary is £400 per annum, with allowance for travelling expenses. There were upwards of sixty applications for the appointment.

A new organ, built by Messrs. Vowles and Son, of Bristol, at a cost of £500, was opened in the parish church of Castle Carey on Sunday.

The memorial stones of a new Wesleyan Sunday-school at Wookey Hole, near Wells city, have just been laid. The building will contain a room 36ft. by 20ft., and on the basement will be three class-rooms, approached by stone stairs. The architect is Mr. R. Rowring, of Wells and Polsham, and the builders are Messrs. Dell Bros., of Wells. The contract price, exclusive of seating, is £427.

WAYSIDE NOTES.

IF that version of the affair in connection with the competition for the new hydropathic establishment at Rothesay which I have read in a contemporary be substantially correct, then there have been few things more discreditable to the architectural profession—to put the matter in the mildest light—and no greater breach of professional etiquette. It is said that three architects practising in Glasgow were invited to submit designs for the Glenburn Hydropathic Establishment, which they accordingly did. Without invitation, however, other men submitted designs, and the plan of one of these latter appearing to have taken the fancy of the promoters of the competition was selected. This is the tale, so far as I can make out. If what really happened is in accordance with the facts as here stated, every architect with an ordinary appreciation of what is right will condemn the action of the party or parties who, uninvited, submitted designs. Persons so conducting themselves can have no sort of regard for other members of their profession. So offensive indeed is this sort of boorish disregard for the feelings of others working in the same calling, that one can with difficulty believe such a version of the story. There must surely be something about this incident not explained to us—some misunderstanding or mistake on the part of the competitors, either invited or uninvited, or on the part of the promoters of the competition. Are no other facts forthcoming? Both invited and uninvited competitors might give their version of the incident in these columns, and then we should be able to judge for ourselves. Meanwhile, for my own part, I hold opinions as above given. It will be a great relief if I can say otherwise.

From Ottawa comes the news of the report of the committee charged with the inquiry into the allegations of dishonest dealings in connection with contracts, &c., let to various contractors, made against members of the Canadian Government. It is worthy of note that this Canadian committee of inquiry followed somewhat the fashion of the day, and disagreed, submitting separate and distinct reports, from the which I draw my own conclusion that many of the "jobs" the virtuous English Press so loudly denounced have happened in fervid imaginations only.

Contractors in this country are inclined to be cautious just now on account of the continued strike in the carpenters' trade; consequently, I fancy, tenders are coming out rather higher than those inviting them fondly expect. Such, at least, I gather from my own experience recently. This sort of thing is doing no good to anybody. The sooner something is settled, the better all round. Naturally one has sympathy with the men in any honest strike, and that even while holding opinions against strikes in general. I much fear that, in the present case, the builders who are refusing the men's demands are doing themselves no good, and possibly much harm. People talk about a large influx of foreign carpenters from the Continent, who with the reputed frugalness of such workmen, and other good qualities, are likely to "come to stay," if they come at all, and find permanent positions in the yards and workshops of builders and contractors. Let such people ask one or two other trades what the *present aspect* of foreign competition is—the paper-makers for instance. They will find it is the foreign employer who is the most formidable competitor. I hear already of architects talking seriously of inviting German builders to undertake contracts.

There is abroad a scheme for constructing reservoirs on the River Nile which, from the injury it would do to old Egyptian antiquities, is said to be creating no little stir with the French savants in various callings. As it is stated that the formation of these reservoirs would flood the islands and temples of Philæ, it is not at all difficult to understand the opposition men of letters and art, architects and archæologists, would offer to the scheme. The island of Philæ has long been a favourite illustration of the possibility of the truly picturesque even in a most rigid and severe, Classic and trabeated style of architecture. It is certain that the most insignificant little picture of Philæ always shows a most enchanting group of old buildings, with impres surroundings, and over all an indescribable ef of calm peacefulness attending most Nile scen Accordingly we may believe that in reality Pl is one of the most beautiful sights in the wo to rank, of its own kind, with Rouen Cathed Sta. Sophia, the Parthenon, and Taj Mahal, perhaps altogether on account of intrinsic m but owing in great part to surroundings accessories. A picture that, as we feel, gives true effect of the Philæ ruins, as seen in a embracing the island whereon they stand glimpse of Nile waters, and a peaceful eve sky, is calculated to excite a desire to behold reality, and likewise to produce a frame of m antagonistic to the construction of reservoirs would cause the island and its temples t submerged.

A reviewer of one of the illustrated maga in a morning paper says: "We are sorry to mechanical processes of reproduction used, to a limited extent, in a high-class wo Wherefore the sorrow? It seems to me tha of the most beneficial inventions of the ag matters respecting the reproduction of ar work is the very mechanical process lam by our reviewer. We may now have before us actual facsimiles of an ar work, faultless and perfect but for significant mechanical imperfections inh to the process, and which are reduced minimum with care and the employment o best kinds of plates and printing paper. Is no gain in having a facsimile of an artist's w Why, then, should we go to the picture gal to see the works of great painters whe may obtain oleographic copies thereof, mechanical" enough in their production? great development of what is called "proc engraving may have made ill times for engr —it has indeed done so, unfortunately for workers. Steel engraving, except for bank- and the like, is almost dead; while wood-engr must have greatly declined as an industry d the last few years. The latter fact we c too greatly deplore, since the beauty of a w engraving is pre-eminently *sui generis* and highest order. While, however, we may the gradually decreasing amount of engraving accomplished, we should be fair new process, and recognise its merits. Ch these is the fact that we obtain, as point above, an almost absolute facsimile of the a drawing, where, with hand-engraving, w uncertain how much to ascribe to the artis what to put to the credit of the engraver. to criticise a magazine, therefore, is alto absurd, and simply reveals a clinging t fashioned custom and prejudice.

Not to be misunderstood in my views o subject, I would explain again that I am alive to the great beauty possible in the w accomplished wood-engravers, and trust th art may never die. There are fortunately publishers and editors who have an antipa "process" work, and consequently we st a number of high-class wood-engraved il tions in books and periodicals. I believe, ever, that the number of such men ye monthly, in fact—becomes smaller, as engraver-friends pass away, and the econo process engraving demonstrates itself; an clearly apparent that the only patrons of sale wood-engraving are "parish maga and the like, whose publishers, I strongl pect, obtain the blocks secondhand. H cause for regret more genuine than th wailing of the mechanical nature of p engraving. As well object to Sir F Leighton's paintings because that artist ments have been mechanically prepared colourman. To the impartial mind, th mechanical nature of process-engraving m its chief recommendation, in that we ma have put before us—through the medium printing-press—not merely the idea draughtsman mangled and distorted by th sympathetic hand of the engraver, bu individuality of the artist, which is the life of all art. G

The Wesleyan chapel at Padgate, near rington, was reopened yesterday (Thursday enlargement and restoration, from plans by Ellison and Son, of Liverpool, at a cost o The builders are Messrs. Gibson and S Warrington.

PORTSMOUTH AND SOUTH HANTS EYE AND EAR INFIRMARY.

THIS hospital or infirmary, which we illustrate this week, is intended to be erected on the site of the present old house used as an infirmary. The out-patients' department is already commenced, the contractors being Messrs. W. R. and C. Light, of Portsmouth.

It is the intention of the Committee of Management that the other portions of the building shall be executed as funds become available. The site is a commanding one, in the old town of Portsmouth, facing the Southsea Common and the Governor's Green, with extensive views of the Isle of Wight and the Solent, the position (facing the sea) being one of the healthiest in this healthy borough.

In addition to the out-patients' department, accommodation will ultimately be provided for thirteen in-patients, with the necessary wards, day-rooms, nurses's-rooms, bath-rooms, and other usual accommodation, the kitchens being arranged to occupy the top floor.

Externally the building will be executed in local bricks of a special shade, with moulded and enriched string-courses, of Bishop's Waltham bricks, with Ham Hill stone for sills, copings, &c. The difficulties of planning have been greatly increased by the necessity of working in the new out-patients' wing and room over (now being executed) with the two existing houses, one on each side of the new wing, that now form part of the old infirmary. The sanitary arrangements have received most careful attention from the architect, who is Mr. Archibald H. Ford, Assoc. Mem. Inst. C.E., of Portsmouth.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

NORTHERN ARCHITECTURAL ASSOCIATION.—The members of the Northern Architectural Associa- held their third annual visit for the summer session at South Shields on Saturday last, when a very large and unexpected variety of work was brought before their notice. A goodly company of members assembled, and under the g of Mr. Joseph H. Morton, F.R.I.B.A., vis following works:—The Theatre Royal, wh just been redecorated and remodelled; t Board Schools in Westoe-lane; the church Michael's and St. Aidan's; the new park Lawe; the Wouldhave Memorial; th swimming baths; and the very fine a hall in connection with the Royal Hotel. the visit a steam launch was placed at posal of the members, who took advanta to run out to sea to inspect the pie southern one being just completed. To the members who had not visited South for several years, the difference in its condition and in its present was very The variety of work inspected, and the signs of progress, which will give South S prominent place among the East coast wa places, raised lively contrasts with the over the water, where a "state of stop" long been the rule. On the invitation vice-president, Mr. Morton, the members of tea at the Royal Hotel.

W MUNICIPAL BUILDINGS, BURY.—THE SELECTED DESIGN.

E give this week the principal and side elevations and plans of the selected design for the new unicipal buildings at Bury, submitted by Mr. N. Bromley, F.R.I.B.A., of Weekday-cross, ottingham, under the motto "Donovan." ree internal courts are shown for light and air, hich, it is proposed, should be lined with white azed bricks. The main entrance gives access to e following departments: Reception, council, agistrates' private entrance, mayor's parlour, tes office, stock and mortgage, &c., water department, and the town clerk, the latter being so approached from the side entrance. The edical officer may also be reached from this trance; in fact, the same may be said of most all the departments. The side entrance ves access to committee rooms, the town clerk's partment, borough treasurer's private office, d auditors, and gives exit for persons passing rough the collection of rates offices. The rough surveyor and chief constable and gas fices, and public way to council chamber, are the incipal departments approached from the angle trance. A special entrance is provided for e weights and measures departments almost clusively, although it is useul for the gas partment on basement floor; a hoist entrance also given. A separate entrance is, of course, iven for the police-court and set of offices, but it made use of for the health department, the hool attendance, the water department (basent portion), and also for the approach to tendant-porter's house, and the kitchen, &c. van entrance is shown into police yard, with ors for shutting out the public, also for elivery of coal and goods. A staircase is own to work with each entrance, except, of urse, in the police-yard approach. The rand staircase would only be used for reeptions, council, mayor, and magistrates. The reat feature in the reception rooms is the introuction of the patent swivel door partition, hich the author has used on several occasions ith considerable success, great improvements aving recently been made in these patents. xtra dining-room accommodation can at once e obtained by throwing reception hall into ining-room by the aid of the sliding partition bove described. A supper room is suggested ver reception rooms in roof, upon a level with ne kitchens. A serving room, with hoists and aircase complete, is given next to dining-room. butler's room and store room are provided, ith good accommodation for wine, &c. It is tuated in mezzanine, over serving room and ante-room. It is thought advisable to separate this department from the kitchens. The council chamber is well placed away from the noise of the streets in the centre of the building. It is approached through the ante-room, and is situated in close proximity to the committee rooms. The committee rooms are situated close to council chamber, and are provided with doors in corridor on each side, so that a private lobby can be formed if thought desirable on any special occasion. The mayor's parlour and mayor's business room are placed side by side, a door communicating between the two; they are situated next to the town clerk, and are provided with a private cloak-room, &c. The town clerk is placed between the mayor's business room and the deputy town clerk. The borough treasurer's offices are situated on the right of main entrance, the public passing in at the side of entrance behind counter, and out again into corridor, and so away into Haymarket-street. The borough surveyor is placed at the angle of the building, occupying an important position, with oriel window at the extreme angle, so that he commands the whole of his department on either side. The gas department is situated under the borough surveyor, and has ready access to the basement (where the showroom is situated) by means of the angle entrance staircase. The water department is placed on the left of the main entrance, and possesses a private staircase down to basement, where the store room and turncock's room are situated. The turncocks have access by police-court entrances. The police-court entrance gives access to the health department, although the medical officer has also access from main entrance. A laboratory is provided in the roof, situated over attendant porter. The chief constable's offices are approached from angle entrance, and have access also from police-yard entrance. The drill-shed is situated in the centre of the building, and columns are dispensed with in carrying the floors above, so as not to interfere with the drill in any way. The police-court is set back from the street, and is surrounded almost entirely by buildings, to prevent noise from the street. The heating power proposed is steam. The style of architecture chosen is an Early phase of Renaissance, which, in the author's opinion, is well adapted to a building of this class, where the requirements are varied and all the light possible is necessary. The floors for the most part would be fireproof; but no special system is specified, as it is imperative that a careful selection in respect to cost should be made. The front elevations would be faced with a selected sample of Derbyshire stone. The whole will be placed upon a rustic basement. The roofs are covered for the most part by green Westmoreland slates surmounted where shown by ornamental cresting, and the large flats would be covered with asphalte upon concrete and iron. The internal architecture to entrance halls and staircases would be carried out to some extent in a selected sample of terracotta, the design especially lending itself to internal requirements. The council-chamber and reception rooms would be panelled in oak. The police-court, staircase, entrance, and public gallery in court would be lined with a selected quality of glazed brick, and the lavatories would be treated with the same material. Attention is directed upon the drawings to the tower above parapet line (where bird is shown) for the purpose of explaining that the portion of tower above this line is not included in the specified sum of £60,000; but a sum is included for roofing it in an architectural manner (see dotted line), to correspond with the left wing (the parapet being the same height), leaving the central turret as the leading feature, should the corporation feel disinclined to entertain the idea of erecting the tower. The additional cost of building the tower would be, with clock and chimes, the sum of £4,500. The cubic contents and schedule of costs are as follows:—Main cubic contents throughout = 1,166,262c.ft., at 10d., £48,594; roofs, chimneys, basement, foundations, prisoners' department, and suggested cloak-room, &c., = 494,722 at 6d., £12,366; total, £60,960. Deduct for suggested additional cloak-rooms, spare offices, and supper-room, not specified in conditions, say, £960; total amount of estimate, £60,000.

SECOND PREMIATED DESIGN FOR NEW MUNICIPAL BUILDINGS, BURY.

This design was submitted by Mr. Henry T. Hare, A.R.I.B.A., of 1, Oval-road, Regent's Park, N.W. The general disposition of the various departments indicated in the instructions has been followed with some unimportant modifications which the author has considered desirable. It has been endeavoured to make each department self-contained, the public office in each case communicating directly with an entrance; or, in each case of the upper floors, immediately at the head of a staircase. The corridors would thus be practically private to the officials, the public having no need to use them in the ordinary course. Special attention has been given to the concentration of offices, so that the heads in each case may have complete control of their departments. The police offices and court are placed on the Moss-lane front, the frontages to Haymarket and Market streets being devoted to the municipal buildings proper. The principal or state entrance is in the centre of the Market-street front, being also adapted for use as the main business entrance. At the same time the arrangements are such that it may, on occasion, be entirely cut off from the rest of the building, together with the state apartments and staircase, without in any way interfering with the carrying on of municipal business. An important business entrance is also arranged in the centre of the Haymarket-street front. The Borough Treasurer's department lies between these two entrances, access being had to the rates office with equal facility from either. Ample counter space is provided, and the main offices are efficiently lighted both by side and top light. The areas have in all cases been utilized exclusively for lighting corridors, lavatories, &c., the whole of the offices lighting outwards to the streets. The division of departments between two or more floors has been as far as possible avoided, in order to secure facility of intercommunication and control. With this object in view the Borough Surveyor's department has been placed entirely on the second floor. It is reached by an ample and easy staircase immediately adjoining the Haymarket-street entrance. The author is of opinion that this disposition would be found to work more satisfactorily than the division of the department suggested in the schedule, both on the grounds mentioned above, and also on the important consideration of light. The state apartments occupy the greater portion of the Market-street frontage, and, together with the committee rooms, council chamber, main entrance and staircase, are entirely self-contained. The only deviation from the suggested disposition has been in the case of the cloak rooms, which have been placed on the ground instead of first floor. This appears to be almost a necessity, as it is very undesirable that guests on the occasions of receptions should be compelled to ascend to the first floor before divesting themselves of cloaks, &c. The council chamber has been placed in the centre of the site in order to insure quiet and retirement from the noise of the streets. This apartment has been brought into close proximity to the state apartments, and, if desired, might be used en suite with them. The committee rooms are placed between the reception rooms and the Town Clerk's department, which latter occupies the greater portion of the first floor of the Haymarket-street frontage. The health and school attendance offices are entered from Moss-lane, and are also accessible from the principal entrance. Some slight deviation from the indicated disposition of rooms has been made in the health department, the inquiry office being placed on the ground floor adjoining the entrance. This appears to be desirable on the ground of directness of access for the public. The weights and measures department is provided with a separate entrance from Haymarket-street. The fireproof vaults in the basement have been placed all together, and arranged somewhat on the model of a safe deposit, having a private corridor for access. These are at the foot of the staircase communicating directly with the Town Clerk's department. Storage is also provided in the basement for general purposes and for fuel with lifts to each floor. As it is probable electricity will be used for lighting, space is provided for engines, dynamos, &c. The accommodation in the police department follows closely the arrangement suggested in the schedule. It is proposed to face the three frontages with Yorkshire stone, probably from the Huddersfield quarries; the roofs to be covered with green Westmoreland slates, and the turrets with copper. Although not compulsory, the author

would propose to make the whole of the floors and staircases fireproof throughout, constructed with steel joists and concrete. The internal courts to be lined entirely with white glazed bricks. The strong rooms would be constructed with blue Staffordshire bricks, and lined internally with glazed bricks, and the use of constructional ironwork would be avoided as far as possible. The state apartments to be panelled round, as shown, in Rangoon teak and other hard woods. The floor to be in parquetry and the ceilings in modelled plaster work. The walls in the council chamber to be faced above the panelling with Ancaster stone. Various marbles would be used in the entrance hall and staircase, in which latter polished Hopton Wood stone would also be employed. The principal corridors and entrances to be paved with mosaic. The rates office to have a dado in American walnut, in which material the fittings would also be executed. The water-closets have been arranged in all cases on outside walls, each one having a window. A separate set of lavatories, &c., has been provided to each department, and it may possibly be considered that the accommodation under this head is somewhat excessive. It has, however, been deemed necessary in order to carry out consistently the idea of self-contained departments. The whole of the drains which are within the building to be of iron pipes with caulked joints, properly disconnected from the sewers by intercepting traps, and with fresh-air inlets and ventilators carried above roofs. Inspection chambers with air-tight covers would be arranged at convenient points in the areas, thus obviating any necessity of taking up the drains in case of stoppage. This, however, would be a somewhat remote contingency, as ample fall is obtainable, and there does not appear to be any difficulty in constructing them on the most approved principles. Flushing tanks would be placed at the head of each system. Open fireplaces are provided in the rooms of all the principal officials. It is proposed to heat the building generally by low-pressure steam, with radiators where required. In the case of the state apartments the coils are placed in the basement, fresh air being driven over them by a fan, and conducted by flues to the various rooms. The system would be subdivided into several sections to give greater control and economy in working. All rooms would be provided with inlet and outlet ventilators under control of the occupants. The turrets would be utilized as extractors. This portion of the work would be intrusted to an engineer of experience in this important branch. Ample boiler power is provided in the basement, consisting of two large Cornish boilers, and a smaller one for providing hot water in lavatories, &c. The external treatment has been designed in a free rendering of modern Renaissance. As, owing to the peculiar outline of the site, each front will be seen almost from any point entirely by itself, each has been designed as a complete composition, and not dependent on the others for its effect. The author has endeavoured as far as possible to give external expression to the internal arrangements. The site does not appear to demand the introduction of a great tower, there being no point at which it would add to the appearance of the building. The author has, therefore, limited the features of this nature to turrets. No public clock is shown in the design. If this is, however, desired, it might be introduced without difficulty by a modification of the large central turret. This would be a very suitable position. The approximate cubic contents of the buildings are as follows: 1,800,000 cubic feet at 8d. per foot, £60,000. For this amount they might be erected in an adequate manner, exclusive of fittings, &c.

LLOYD'S BANK, CATERHAM.

This building is erected at Caterham Valley, opposite to the entrance of the Caterham Station of the South-Eastern Railway. The lower story is faced with red brick from Erith, the upper being executed in timber framing, with rough cast, the gables being filled in with ornamental plaster work, the roof covered with tiles from the Godinton Tile Works at Ashford. The internal arrangements provide for bank, with strong-room in basement, and the upper part provides ample accommodation for the resident manager. The internal fittings of the bank are executed in American walnut. The whole of the works have been designed by Mr. A. R. Stenning, F.R.I.B.A., of 121, Cannon-street, E.C., and carried out, under his supervision, by Messrs. J. and J. Ward, builders, of Warlingham, Surrey, at a cost of £2,350. The drawing was shown this year at the Royal Academy Exhibition.

SOUTH KENSINGTON MUSEUM COMPETITION.

This double-page shows the detail of the principal entrance of Mr. T. E. Collcutt's design with two sections. We gave the view and plans of his design on Friday, August 21st. Last week we published a similar detail of the selected design by Mr. Aston Webb, so that a comparison between the two compositions may be readily made by our readers. Some further illustrations of the more notable of the other designs will follow at an early date.

OLD BRIDGE OVER THE RIVER NIDD AT HAMPSTHWAITE, YORKSHIRE.

This bridge is situate in the beautiful Valley of the Nidd. It lies on the east side of the village of Hampsthwaite, about a mile and a half south-west from the town of Ripley, and four miles north-east of Harrogate. The exact date of the first bridge is probably unknown. The present one appears to have work of different dates in it. This sketch was taken in 1881.—E. B. Lamb.

CHIPS.

A Congregational church is being built in Waterloo-road, Freemantle, near Southampton. Messrs. Mitchell, Son, and Gutteridge are the architects, and Mr. A. Warden is the builder.

The small but interesting village church of Farmcote is about to be restored from plans by Mr. H. A. Prothero, of Cheltenham. Mr. J. A. Oakey, of Winchcombe, is the contractor.

The free library at Cardiff is about to be enlarged from plans prepared by Messrs. Seward and Thomas, of that town.

The Sheffield school board have adopted plans prepared by Mr. C. J. Innocent, of that town, for a new school to be erected at Hunter's Bar, Ecclesall-road.

M. Augustin Theodule Ribot, the well-known Parisian painter, died on Sunday evening at his villa at Colombe, aged 68 years. A pupil of the elder Glaize, all his works are characterised by a faithful reproduction of nature, even in its ugliness, and by the exceptionally dark tones. Among his masterpieces are "Les Cuisiniers," with which he made his *début* at the Salon thirty years ago, "Jésus et les Docteurs," the "Samaritain," and "S. Sébastien."

The Stafford board of guardians have adopted plans by Mr. Wormal for alterations and additions to the workhouse buildings.

A group of Sunday-schools for the Welsh Calvinistic Methodists are to be built at Splotlands, near Cardiff. Messrs. Habershon and Fawckner, of Pearl-street, Cardiff, are the architects.

Mr. E. Clavey, the late borough surveyor of Burton-on-Trent, died at his residence, St. Paul's-square, in that town, on Sunday week, at the age of 55. Mr. Clavey was appointed surveyor in 1865 and continued in that position until May, 1890. He had therefore been associated with most of the principal works of public improvement inaugurated in the borough. The funeral took place on Wednesday week, and the service in the church was attended by many members of the corporation, officials, and members of the general public.

The parish church of Llanfihangel Rhydithon, Radnorshire, was reopened last week after restoration. Mr. Stephen W. Williams, of Rhayader, was the architect, and the contract was carried out by Mr. H. Price, of Builth. The work included the pointing of the external wall with cement, and repair of the tower. The floor of the church had become badly decayed, and it has been taken out and replaced with wood blocks under the seats, while the aisle and chancel have been paved with encaustic tiles. A heating apparatus by Porritt has been placed under the floor. The wood panelling of the walls under the window-sills has been replaced by a dado of Portland cement. The old-fashioned pews were taken out, and open seats of varnished pitch-pine erected in their place. The plaster ceiling of the roof has been stripped off, and a boarded panelled roof substituted, the old principals remaining in their places. The gallery has been removed.

Bethesda Congregational Chapel, Runcorn, was destroyed by fire on Sunday. The building was erected 56 years ago, but had been refitted in pitch-pine. A gas jet left alight near part of the organ-case is supposed to have been the cause of the accident. Another chapel, that in Kent-street, Portsea, was burnt out on Tuesday, this calamity being attributed to the overheating of the stove.

NOTES FROM EDINBURGH.

It is only natural to expect that, with the c tinuous extension of the city, there sh be an increase in the estimates of its expendi in civic matters. And this has been the c but in late years it has come in a fashion nc all creditable to the parties entrusted with management of municipal affairs, the incr revealing itself to the public more or less a unexpected and dissatisfactory surprise. estimates for 1892-93 have just made t appearance, repeating the experience of for years; but with a rise unprecedented in amc —viz., £22,760, which means from 3d. to per £. This large sum is partly accounted by £9,000 deficit of last year, and it becc evident that some departments have been carelessly estimated or extravagantly carried or probably both. If we except the public and recreation grounds, there is nothing ap ciable by the public to account for the l expenditure. The chief offenders are the sani and cleaning committee, and they account their extravagance by laying it at the door of influenza epidemic, which has been virulen its attack both on the inhabitants and horse the city. Probably the parties incurring penditure in all departments are of the s mind as Baillie Colston, who thinks £1,0 mere drop in the bucket, in which case extr gant increase is easily accounted for. In s other respects the present administration been severely criticised: for their bad bar with the gas company; their own manage of the works, deteriorating the quality and creasing, instead of reducing, the cost. T has been much unnecessary expenditure in nection with Parliamentary Bills, which a more tact in management would have avoi and many are much dissatisfied with the pros of bringing in an additional water supply, w it has not been ascertained that the present su properly utilised would not be ample for years to come; and by their proposal to refuse destructors—getting rid of one nuis by the creation of another.

Something, however, has been done appreciable result. The committee who the care of providing and maintaining open sp for recreation have been doing good work. M has been excellently done to improve neglected public gardens; and the Princes-s Gardens, east and west, are models of lands gardening, and highly appreciated by the pu The N.B. Railway proposes to increase number of their rails in a way that will des nothing of the beauty of the gardens, and t will be no necessity for resorting to the ab device of hanging grass and shrubs over the way lines.

The authorities appear to have been sati with the results of the hard-wood block p ment in Princes-street, and are going to ex it. Portland cement paving has also largely adopted with the best results. St and Co. are at present laying a large area their granolithic slabs, 9ft. square, in front o Register Office, where an alteration has been r for relief of the pedestrian traffic in that qua where four principal thoroughfares conv The original parapet in front of the Reg Hcuse has been put back, and is now about from the roadway, the staircase still projec in the centre. This allows also of a slight provement in width for carriage traffic at th of Leith-street, where it has always dangerously contracted.

There is no slackening in the building tra and masons have had an advance lately to The workmen have not yet completed their parations for erecting the roof of the new co hall; but the material is forward. The W of Leith Drainage is meeting with unexpe difficulties in its way in the section bet Cawnmills and Murrayfield, and they are after eight months, at work on the north si the town.

The Antiquarian Museum is now open t public and in its new abode. It appears to oc most of the available space in the three f provided for it. The collection of speci illustrative of the Stone Period may be c immense, and to the eyes of the ordinary vi they will appear interesting. The Scottish and silver ornaments are elegant in workmar beyond what could be expected of the pe The Industrial Museum, however, will alwa the most popular, and is well patronised a times. Some alterations of arrangement

been made lately in the large hall, and new exhibits placed. One of the most interesting—architecturally—is a lofty obelisk from the ruins of Quirigua, in Central America, cast from moulds taken by Mr. Maudsly, who excavated it. It contains, on the two broader sides, a granite face and figure of the idol god, Egyptian in style; the other sides and the figure are all covered with symbolic carvings, which may be letters. It is impossible to tell whether or not it is a monolith.

The font and tabernacle rising out of it, in the church of St. Giovanni, Siena, in white marble on black marble base, has been very carefully reproduced, with all details; both are hexagonal, the font having gilt panels, illustrating events in the life of John the Baptist. Several artists have lent their hands to the original, the date of which is 1430, and the style that of the Early Renaissance. The scenes illustrated are these: The Angel appearing to Zecharias, by Della Querai; The naming of St. John; St. John preaching; St. John baptising Christ, and St. John rebuking Herod, both by Gheborti; and The head of John presented to Herod, by Michelozzi. The countenance of the king in this last panel has been admirably rendered, expressing his repugnance at the execution of his order. There is also a very odd monument to some German Elector, 1514, with the Crucifixion figure above, and three bishops below; the figures and attitudes are forcibly expressed, but all the architectural detail is of the most debased character, though no doubt executed with elaborate carefulness. Workmen are busy erecting a large cast of another of these monuments. There has been added a cast of a carved stone altar-piece of the 14th century, in St. James's Church, Lubeck. The panel composing it contains sculpture of the Crucifixion, crowded with figures, of which those of the principals are in bold relief. It is interesting to compare with this more ancient work the modern work of similar purport. G. Tinworth has a three-panel altar-piece, designed for execution in Doulton's terracotta, and the work, if it can be produced in terracotta, as shown in the cast, will stand comparison with anything of its kind. The panel to the left is called "Gethsemane," and represents the officers falling to the ground instead of apprehending the Saviour. The figure is dignified, and admirable in its expression of the countenance. The centre is, of course, the Crucifixion, called "Golgotha," and the interest is maintained by the groups of figures in the foreground in full relief, and easily recognised. The third panel is less interesting, representing the soldiers parting the garments and casting lots for the coat.

There is also erected an interesting architectural detail from the Western Doorway of Chartres Cathedral, 12th-century work, showing twin columns, with two characteristic figures wrought on them, of large proportions, and which, notwithstanding their odd and perilous position, are very gracefully posed. The minor details on capitals and mouldings are very elaborate, and practicable only on buildings of like magnitude.

The foundations for the new West Kirk are at last fairly started, all opposition being overcome, and the Mother Church of the modern city will have the reproach of being the ugliest taken away. Another and better site cannot be had without a great expense. What can be seen of the church from the level of Princes-street will be the more ornamental portion, on a level with the eye, and as the whole will fill a greater space than the present parallelogram, it will be a very conspicuous addition to the architecture of the district, and possibly throw its rival, St. John's Episcopal Church, into the shade, or be, at least, more worthy of its company.

MARKET HALL AND ASSEMBLY-ROOMS, LLANDRINDOD WELLS.

THE drawing shows the partial rebuilding and enlargement of the existing Market Hall, recently completed under the superintendence of Mr. H. L. Griffiths, architect, Newport. The contractors are Messrs. W. P. Lewis and Co., Hereford. The materials used are red brick, half-timber, and red tiles.

HONES.

THE finest whetstones known for the sharpening of fine-edged tools are obtained from Arkansas, so says Curator Merrill, of the Smithsonian Institution. In that State are beds of what is called "novaculite," which is what is scientifically known as an "altered schist." This means a deposit of a flinty nature, usually combined with limestone, the rock thus produced being changed in such a manner molecularly, by processes not altogether understood, as to supply a surface most suitable for grinding. Arkansas furnishes the entire supply of novaculite for the United States, also filling a large part of the export demand, which is very considerable. The main deposit of the material is in a single hill about 500ft. high. For the sharpening of keen-edged tools, razors excepted, this novaculite is unrivalled. It is a very beautiful stone, of snowy whiteness, and is quite costly, because it has to be cut by diamond dust, owing to its extreme hardness.

Next in point of quality for whetstone purposes is a grey, fine-grained sandstone from Orange County, Ind. It is called indifferently "Hindustan stone" or "Orange County stone." Very commonly it is made into long spikes for sharpening knives upon in the kitchen, and for this purpose it is far better than steel. Another sandstone employed for the same purpose is quarried in Cortland County, N.Y., and is called, without any reason that I know of, "Labrador stone." It is a dark grey colour.

A still coarser whetstone for scythes and other such tools is made from Berea grits, a sandstone found in the neighbourhood of Berea, Ohio. Also there are certain qualities of fine-grained mica schists—a crystalline rock of quartz and mica—which are obtained from New Hampshire and Vermont, and utilised for hones wherewith to grind tools of the bigger sort. But it must be understood that there is hardly such a thing as a whetstone quarry. Nearly every quarry from which whetstones are derived is worked chiefly for obtaining building stone, the small pieces of particularly fine grade only being utilised for making whetstones.

Three stones imported from abroad are employed in America for whetstones. The best known of these is the German razor hone, which is commonly used by barbers for sharpening their razors, and is in all probability the best substance for the purpose known. It is found chiefly near Ratisbon, Germany, in the old river bed. During the period of early geological formation the river brought down to that point mud which was deposited on the bottom. This mud varied in material from one season to another, depending upon the source from which it was derived, so that during one year it was white and during another blue. Subsequently, in the course of ages, the mud became stone, and now the white layers serve to sharpen the blades by which civilised men all over the world keep their faces clean of hair. Because the white stone is costly it is usual to back a thin slab of it with another slab of the cheap blue stone, fastening the two together with cement. Such is the ordinary razor hone of commerce. These German hones cost only a fraction of what is charged for novaculite scraps of the same size, but there is a duty upon them, which, together with the expense of transportation, renders them about as high in the market. There are two other foreign whetstones commonly used in this country. One of these is a fine-grained schist from Scotland known as the "Water of Ayr," and used much by carpenters and stone-cutters for rubbing down the surface of other stones. The

other is the "Turkey oilstone," resembling novaculite.

The stones used in this country for grindstones are mostly from Ohio and Nova Scotia, the latter supplying the best grade, which does excellently for scythes. Of foreign grindstones most come from England. Of all whetstones the most curious and interesting are those which are utilised by engravers to sharpen their engraving tools. They are of every shape imaginable, from long needle-like points to fine-edged sticks, the object being to grind the little points and edges of the steel instrument, which could not be sharpened upon an ordinary stone.

CHIPS.

The Queen's Court Bridge at Faversham has just been rebuilt at the joint cost of the Kent county council and the Faversham highway board. Messrs. Fuller and Sons were the contractors.

The foundation-stone of the new hospital for the sick poor being erected in connection with the East Poorhouse by the Dundee parochial board was laid on Saturday afternoon with Masonic honours. The new hospital, which will accommodate about 300 patients, will consist of a central administrative block, with pavilions on each side, and a separate establishment in rear for the treatment of infectious diseases. The estimated cost, including furnishings, is £25,000.

An English Wesleyan chapel is about to be built at Ferndale, Glam., from plans and designs of Mr. Walter Jones, of that town.

On Wednesday week a new Wesleyan chapel, in Beech-lane, Hartford, Cheshire, was opened. The new chapel is Gothic, executed in brick, with a spire which, when completed, will rise to a height of some 75ft. The façade is of Ruabon brick, with dressings of Manley stone. At the rear are vestries and classrooms. The interior, which will seat about 350, is fitted with pews in pitch-pine. The total cost, including architect's fees and land, is about £2,400. Mr. Richard Beckett, of Hartford, was the builder, and Mr. John Wills, of Derby, the architect.

At the last meeting of the local board of Paignton, near Torquay, a discussion arose on a recommendation by the medical officer of health, endorsed by Dr. Vickers, a member of the board, that it was desirable that the subsoil of all areas to be covered by buildings should receive a layer of concrete. Mr. J. S. Bridgman, V.P.S.A., a member, urged that in some parts a layer of concrete was unnecessary, and would involve needless expense. The chairman pointed out that the by-laws of the board required a concrete surface, and no hardship would be involved if the rule were uniformly insisted upon.

The parish church of St. Warburgh, Spondon, Derbyshire, a 14th-century structure, is about to be restored under the direction of Mr. J. Oldrid Scott, F.S.A.

The peal of six bells in Eldersfield Church, Worcester, was reopened on Tuesday after the recasting of the second and third, and the renewal of all wood, brass, and iron work about the bells, including new clappers. Messrs. Taylor and Co., of Loughborough, carried out the work.

Mr. Paul Jacob Naftel, the water-colour landscapist, died on Sunday at his residence at Strawberry-hill, aged 75 years. His sketches from the Channel Islands were exhibited at a "one-man show" in Bond-street a few years since. He was the father of Miss Naftel, the accomplished flower painter, who died a year or so since.

A Gospel hall to accommodate 500 persons is about to be built on the Whitecross Estate, Weston-super-Mare, from plans by Messrs. Hans Price and Wooller, of that town. Mr. C. Taylor is the contractor.

Mr. S. J. Smith, Local Government Board inspector, held an inquiry at Colne, Lancashire, on Friday, into the local board's application to borrow £7,987 for works of private street improvement. The application was unopposed.

At Coatbridge Dean of Guild Court, on Friday, lining was granted for a new Roman Catholic chapel to be built in Whifflet-street, to be known as St. Mary's. The building is to accommodate 900, and will cost £5,200.

A new cemetery at Alfreton was dedicated on the 10th inst. It has been laid out from plans by Mr. Houlton, surveyor to the local board.

In the Galerie Mollier, at the Louvre, has now been set up the great mosaic known as that of the Kabr-Hiram, discovered by M. Renan near Tyre, during his expedition in 1863 to Phœnicia. This vast work constituted formerly the pavement of a church dedicated to St. Christopher. The design includes decorative medallions, representing combats of animals, and episodes of husbandry, these being bound together by conventional foliage and arabesques.

Building Intelligence.

Bishopston, Bristol. — On Saturday the foundation-stone of the Franciscan Friary of St. Bonaventure's, at the top of Egerton-road, Bishopston, was laid. The first portion of the friary will form the east side of a future quadrangle. The church will be on the north side, and the south and west sides will be a continuation of the friary. The part now undertaken will consist of porch, hall, reception rooms, porter's room, study, library, and friars' cells and cloisters, which will in the future be continued to form the quadrangle. The total length of the portion now to be built will be 108ft., and the width 33ft. The style of the friary will be Domestic Gothic of the 15th century, rather severe in style, in accordance with the Franciscan rule. The building will be of local stone, with dressings of Bath stone. The first contract is being carried out by Messrs. Wilkins and Sons, Bristol, the architects being Messrs. Pugin and Pugin, of Westminster. The amount of the contract is about £3,000.

Glasgow. — The special sub-committee appointed by the town council of Glasgow to inquire into the costs and financial results to the Improvement Trust of erecting workmen's dwellings and a "family home" on vacant ground at the corner of High-street and Rotten-row, has just issued its report. The cost of the buildings is estimated at £18,100, and the cost of the site is recorded at £5,962, being £24,062 in all, the annual interest on which sum is put down at £931. It is thought that an annual revenue of £853 will be got from the shops and houses, and that the "home" will yield annually £360, after paying all expenses, the total revenue being thus £1,213, leaving an apparent surplus over the annual charge of £281. The committee recommends that the principle of the trustees themselves erecting the buildings be affirmed by the general committee, and that the matter be remitted back for further consideration.

Herne, Kent.—The restoration of Herne Church has now been completed. In 1869 the present vicar commenced the work with an expenditure of £2,000, and a further outlay of £1,000 upon the north aisle has now been made. The bays between the principal and intermediate rafters are filled in with boarding and finished with mouldings, the spandrels being carved. The carving was executed by Mr. Ratcliff, of London, and the whole of the woodwork of the new roof is made of Jarrah wood from Western Australia. The east gable has been restored to its original pitch in Chillmark stone, with parapets and new stone cross. A canopied niche has been formed in the gable, in which will shortly be placed a sculptured subject, executed by Mr. N. Hitch. The contract has been carried out by Mr. H. B. Wilson, of Canterbury, who restored the nave and north aisle of Herne Church in 1853. The architect is Mr. Francis Butler, of London.

Trowell.—The parish church of St. Helen is of considerable antiquity, with a fine tower and an Early English chancel, but the whole building needs restoration and repair. Plans have been prepared by Mr. Hodgson Fowler, and it has been decided to carry out the complete restoration at a cost of £1,520, of which £930 has been already contributed. A faculty has been obtained for the proposed alterations. The alterations in the chancel, according to Mr. Fowler's plans, are:—To remove the roof, and lower the side walls 3ft.; to raise the east gable and provide a new oak roof covered with lead; to replace the modern east window with one more in keeping with the architecture of the church; to remove the plaster from the internal dressed stonework; to replace the floor, and to erect new oak choir seats, altar table, and chancel screen. The tracery of the windows will also be renewed, internal stonework dressed, and the main timbers of the roof exposed and cleaned. A new south door and oak pulpit on a stone base, and a permanent ringing-floor in the tower, will also be included. The contractor for carrying out the alterations is Mr. Bowman, of Stamford.

According to a re-valuation recently made of the Glasgow Improvement Trust property by Mr. MacDonald, the city engineer, there is an estimated reduction of the value compared with the former valuation of £130,000. This amount falls to be added to the excess of liabilities over assets, and this now stands at £155,000.

Engineering Notes.

Manchester Ship Canal.—The work o filling the Ince section of the Ship Canal wit water was begun on Monday morning. Th section extends from Ellesmere Port to the mouth of the River Weaver, a distance of seven miles The filling process will be completed to-day (Friday), when the depth of 26ft. will be reached and a small dam separating the canal from th Weaver will be cut away, and the great sal traffic from Northwich and Winsford will then be accommodated by the Ship Canal. The letting in of the water at Ellesmere Port was accom plished by connecting the full Eastham sectio with the empty Ince section. A pipe of 90ft long and 4ft. in diameter was run through th dividing neck of land, the flow of water being controlled and regulated by a sluice arrangement Mr. Jones, agent of the section, Mr. W. H Topham, manager of the works, Mr. Price chief agent, and Mr. Fitzgibbon, resident engineer, were present at the successful operations o Monday.

The Ribble Navigation Works.—The Parliamentary Committee of the Preston Corporatio and the Ribble Committee have both decide unanimously, after consideration of the recen report of the Ribble Navigation Commission, tha it is not advisable to apply to Parliament a present for further powers; and that it would b better to watch the effect of the north training wall. It is stated that there is sufficient money in hand to complete the dredging down to depth of 5ft. below the level of 1883, to erect th north wall, and to complete the dock contrac and its equipment, thus completing the works a far as Lytham.

The St. Clair Tunnel.—Sir Henry Tyler chairman of the Grand Trunk Railway, is abou to formally open the St. Clair Tunnel, which forms a land connection between the Canadia lines and the American lines under the same management running to Chicago. Hitherto th trains have been carried over the St. Clair River —the outlet of Lake Huron—on huge ferry boats. The tunnel makes the time of transit very much shorter, and a simultaneous alteration i the routes of approach to the river has reduce the length of the line by six miles. The tunne is 6,026ft. long, or 11,553ft. including it excavated approaches. The boring of the tunne proper was done by means of Beach's wrought iron shields with sharp cutting-edges, each shield being driven forward by hydraulic rams o enormous power. From the time when the shield were lowered into position at the two propose entrances till they met in the middle of the work occupied just a year. The tunnel is 20ft. in diameter, and is lined throughout with cast-iron plates 2in. in thickness. Over 880 tons of bolt and nuts were used in constructing the lining which weighs altogether 28,000 tons. The roa bed under the river is practically level, but th gradient of the approaches is 1 in 50. Arrangements have been made for electric lighting al through the tunnel and for ventilation. The cos of the tunnel proper is given as £292,000. Mr Joseph Hobson, of Ontario, was the engineer.

The strike of the masons employed at the erection of the new bridge and town hall at Newry is at a end, members of affiliated branches of the labou societies—these being separated from, and independent of, the one local society in Newry—now having supplanted the men who turned out.

Mr. William Wildash Foord, one of the seniors o the firm of Foord and Sons, of Rochester, Government contractors, &c., died very suddenly whils standing on the Sun Pier, Chatham, on Thursday in last week. Mr. Foord was one of the aldermen of the new municipal borough of Chatham, and councillor of the city of Rochester. He was 6 years of age and had never married.

The Marlowe Memorial, which was unveiled o Wednesday by Mr. Henry Irving, will, when completed, consist of a Renaissance pedestal, carved in Portland stone, with four niches, intended to receiv four statuettes, Tamburlaine, the Jew of Malta Faustus, and Edward II. Of these only the firs has at present been completed. The pedestal wil bear a life-size bronze statue of a Lyric Muse. The monument rises about 13ft. above the level of th ground, and occupies the centre of the picturesqu little square at Christ Church gate, which was in ancient days the city bull stake. Mr. E. Onslow Ford, A.R.A., is the sculptor.

COMPETITIONS.

BLACKBURN.—At the last meeting of the Board of Management of the Blackburn and East Lancashire Infirmary, the report of the assessor, Mr. Alfred Culshaw, of Liverpool, on the nine sets of competitive plans received for the nurses' home, was read. Mr. Culshaw awarded the premium of £30 to the author of the plans under the motto "Light." On the envelope being opened the successful competitor proved to be Messrs. Simpson and Duckworth, of Richmond Chambers, Blackburn. The authors of the successful design estimate the cost at £3,477. The main entrance is in Infirmary-road, and is separate from the nurses' entrance, and approached by the covered way from the infirmary. The bedrooms generally are divided into suites of six, each group being complete in itself, and provision is made for six private nurses, six probationers, six charge nurses, and six night nurses. Two spare bedrooms are also provided. There will be large reading and recreation rooms. The building will be heated throughout with hot water. The style adopted is Elizabethan. The materials specified to be used are red Ruabon or Whinney Hill, Accrington, bricks, and Darleydale or Culingworth, Yorkshire, stone, with Carnarvon slate for roofs. The floors throughout will be of fire-proof construction. The father of the senior partner in the successful firm, the late John Simpson, superintended the erection of the Infirmary, and from the laying of the foundation stone in 1857 till the present day father or son have advised the board in all matters architectural. Mr. Angelo W. R. Simpson has been consulting architect to the board for the last twelve years, and he prepared the plans for the new wing which was added to the infirmary seven years ago. Two new entrance lodges have since been erected under his supervision, and now he and his partner are to build the nurses' home. The conditions were drawn up under the guidance of the assessor. Owing to a letter from one of the competing firms calling attention to the condition offering a £30 premium, but not necessarily guaranteeing that the author of the selected design should be intrusted to carry out the work, the infirmary board extended the time and undertook to accept the assessor's decision, and to employ the selected architect to carry out the work, provided that the architect could give reasonable satisfaction that he was able to carry out the work from previous experience.

CORK COURTHOUSE.—Friday was the last day for the lodging of the plans for the building of a new courthouse in Cork on the site of the one burned on Good Friday last. Thirteen were handed in at the Munster and Leinster Bank, although but fifteen applications were received by the committee for copies of the printed directions and instructions.

CHIPS.

An application having been made for the discharge from bankruptcy of George Veale, of Palatine-road, Stoke Newington, and Dunsmuir-road, Stamford Hill, builder and contractor, the Registrar has suspended the discharge for six years from Feb. 4th, 1890.

The memorial of the late Bishop of Dover has just been placed in the nave of Canterbury Cathedral, and will be unveiled by the Primate about the middle of October.

The Worshipful Company of Carpenters, in conjunction with the Council of Queen's College, have established at that college wood-carving classes. The day classes are held on Monday, Wednesday, and Friday afternoons, from 2 till 5; and the evening classes on Mondays and Wednesdays, from 7 till 9. Ladies will be permitted to attend, and prizes are offered by the Company.

A reredos is now in course of preparation for St. Luke's church, Fernhead-road, West Kilburn, at the hands of Mr. Oscar Junck. The entire recess formed by the west wall, below the large window of the chancel, 27ft. in width, is to be filled with terracotta, divided into four compartments. The upper panel is to be filled with a slightly-modified representation of Da Vinci's "Last Supper."

New Brunswick's lumber cut for the coming winter is estimated at 75,000,000ft., a decrease of 5,000ft. as compared with 1889.

The Deganway Estate, situated midway between Conway and Llandudno, and comprising some 280 acres, chiefly fronting the sea, was sold by auction at Llandudno on Tuesday. It cost the last proprietor a few years since £68,000, but was disposed of in one lot for £29,000

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., L., LI., LIII., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Correspondence.

THE FACTORY ACT AND FIRE REGULATIONS.

To the Editor of the BUILDING NEWS.

SIR,—Under the Factory and Workshop Act, 1891, section 4, which comes in force on the 1st of January, 1892, all factories in which more than forty persons are employed have to be furnished with a certificate from the sanitary authority of the district in which the factory is situated that the factory is provided on the stories above the ground floor with such means of escape, in case of fire, for the persons employed therein as can reasonably be required under the circumstances of each case. As far as I can ascertain, the authorities have not made any regulations. As the subject is of great importance, I venture to call the attention of our profession to it, and suggest that an endeavour be made to obtain *uniform* regulations for the administration of the Act for the guidance of the authorities and the owners of such properties or their professional advisers. The Act makes the owner, and not the occupier, responsible for the provision of the alterations which may be required before the certificate in granted.

In the application of this section to the administrative County of London, the London County Council take the place of the sanitary authorities. H. D. SEARLES-WOOD.

157, Wool Exchange, Coleman-street, Sept. 9.

AUSTRALIAN TIMBERS.

SIR,—As a regular contributor, years ago, to the BUILDING NEWS, and as now one of the editors of the *Australian Builder and Contractors' News*, I have the pleasure to draw your attention to a valuable and instructive paper on "Some Ornamental New South Wales Timbers," which was read last Monday before the Sydney Architectural Association by Mr. J. H. Maiden, F.L.S., &c., Curator of the Sydney Technological Museum, and Consulting Botanist to the newly-established Forestry Department of New South Wales, and which you will receive in print by the mail which bears this letter. In view of the remarkable wealth of several of the Australasian colonies in timbers (both hardwood and ornamental) suitable for the various purposes of the engineer, the builder, the joiner, and the cabinetmaker, I venture to think that any practical information upon this subject would be not only interesting, but of real value, to many of your English readers—especially to architects and contractors.

Unfortunately, Australians themselves do not as yet know nearly as much about their native timbers as they should do, and in many cases the same wood is called by half a dozen different names by different individuals, some very amusing instances of which were recently narrated to me by one of the leading officials of the Sydney Technical College—now an admirably conducted branch of the Department of Public Instruction—on his return from a visit to some parts of the interior of this colony. But this ignorance is, happily, decreasing day by day, and it is not improbable that before very long a knowledge of Australian timbers and their qualities may exercise some appreciable influence on the timber markets of the world. For the knowledge referred to we are chiefly indebted to the establishment, a year or so ago, by Sir Henry Parkes, the veteran Premier of New South Wales, of the Forestry Department of this colony, under the general direction of Mr. J. Ednie Brown, who had previously distinguished himself by his exceedingly able occupancy, for some seven years, of a similar appointment in the younger colony of South Australia, and whose enthusiasm, ability, and sound judgment are already bringing about most satisfactory results in connection with his present administration.

The value of our hardwood timbers is far more widely known than that of our ornamental woods; and some three years since the especial utility of the former for purposes of comparatively fire-proof construction was forcibly drawn attention to in the leading organ of the Sydney daily Press, both by the President of the Institute of Architects of New South Wales and by myself, after a most disastrous fire at one of the newspaper offices; while for such purposes as piles and railway sleepers I doubt whether any country affords timbers more suitable than some of our gums and eucalyptus.

Bearing in mind the expediency, from considerations of mutual interest, of promoting a still closer commercial intercourse than even now exists, between the United Kingdom and Australia—New South Wales, I may remind you, Sir, is (and is likely to remain) a free-trade country—the qualities and possible applications of Australian timbers is one of the matters connected with these colonies information respecting which it seems to me desirable should be made as public as possible in England; and with this object, Sir, I send you these few lines, in case you may think them of sufficient importance to publish them in your valuable journal.—I am, &c.,

JAMES GREEN. ("De Libra.")

Head Office of the *Australian Builder and Contractors' News*, 527, Kent-street, Sydney, New South Wales, Aug. 8.

The Baptist chapel at Alderton, near Evesham, reopens on Sunday next after extensive alterations, carried out by Mr. John A. Oakey, of Winchcombe.

St. John's Seminary for the education of R.C. clergy for Southwark, at Wonersh, near Guildford, was opened on Tuesday week. Built of red brick, with Bath stone dressings, its style is of the Early English Renaissance. The main building consists of a central block 150ft. long by 42ft. wide, with flanking wings 120ft. by 34ft. at each end. On the ground floor are studies, conference hall, a refectory, and numerous class-rooms. Upstairs, and reached by wide staircases at either end, runs a corridor, from which lead the library, the professors' hall, and other fine apartments. The buildings have been erected at a cost of £30,000, by Messrs. Longley and Co., of Crawley, Sussex, from the designs of Mr. Fred A. Walter, F.S.A., of Westminster. A chapel has still to be erected at a cost of £5,000 more.

Intercommunication.

QUESTIONS.

[10625.]—**Palladian.**—Would any of your better-informed readers kindly inform me what the *distinctive* differences of style are as practised by Palladio and Bramante, other than the order running through two stories of the former? Might I take it that the Valmarini Palace and the Cancellaria are typical examples showing them sufficiently?—Youngster.

[10626.]—**Sewage Filtration.**—Will some reader kindly give me the name of a good work on sewage filtering beds, their construction, or any information respecting the quantity of land required to filter sewage from a house of about thirty inhabitants, it being desired to form a piece of ground into an irrigation bed, and to dispense with present cesspool arrangement?—Architect.

[10627.]—**Isometrical Projection.**—Will some reader kindly tell me a book treating on isometrical projection? Several questions in the R.I.B.A. Intermediate Exam. require its use, and I cannot find out what is meant. Is it really isometrical projection, or the adaptation of it sometime used, which is required?—L. D. U.

[10628.]—**Corrosion of Steam Space in Boiler.**—I have a wro't welded boiler fixed in large kitchener supplying steam to cooking pans, &c. The boiler (⅜in. thick) becomes corroded through at steam space in less than two years after fixing. Can any reader suggest means by which this may be improved upon?—F. R. Penistun.

REPLIES.

[10623.]—**Brick Arch.**—For the setting-out and construction of this arch (so-called), see "Practical Brickwork," by F. Walker (Crosby Lockwood and Co.), 1s. 6d. An arch of this kind should be supported by two small iron or other columns, forming an impost for the semi-arch to spring from.—Brickwork.

CHIPS.

A new board school was opened on Monday at Larbert. It accommodates 300 scholars. The structure, which is a two-story one, is 70ft. by 52ft., and has four large class-rooms, 33ft. by 23ft.

The corporate property committee of the Leeds town council have advised the latter body to adopt a scheme prepared by Mr. T. Hewson, the borough engineer, for the reconstruction of drainage of the town hall, at an estimated cost of £2,800.

Plans have just been passed for the erection of a free church for the Windmillhill district of Motherwell. The church, which will be known as the Free South Church, will accommodate 410 sitters, and 500 additional seats can be added at any future time. The design of the building is a Scottish development of Thirteenth Century Gothic. The church will be roofed in one span, with circular steel trusses encased in wood. The cost is estimated at £2,000.

Councillor William Newman, lock-furniture manufacturer, whose works are situated in North Wolverhampton, was found dead in bed at his residence, at Penn, on Tuesday morning.

A new police station has been erected at Whitley, and special attention has been paid to the ventilation, the extraction of the vitiated air being effected by Messrs. Boyle and Son's latest improved patent self-acting air-pump ventilators.

Alterations and additions to Sister Morgan's Home, Treforest, will shortly be commenced from plans prepared by Mr. Charles C. Jones, architect, Cardiff.

Extensive drainage arrangements have been recently carried out at All Saints' College, Bloxham, Thenford House, and Wykham Park, the seat of Mr. Wm. Mewburn. The old systems have been taken away, and replaced with Doulton's glazed pipes intercepting and inspection chambers, ventilating appliances, flushing tanks, and every modern sanitary arrangement of the day, and are in perfect working order. The whole of the above extensive works have been designed and carried out by Mr. J. W. Harding, sanitary engineer, Broad-street, Banbury, Oxon.

The Earl of Portsmouth's mansion at Hurstbourne Park, near Whitchurch, which was destroyed by fire some time since, is to be rebuilt from plans said to have been prepared by his son, Viscount Lymington, M.P.

On Monday 3,500 hands employed in the lumber mills of Ottawa struck work, demanding increased pay and shorter hours. The wages had been reduced in the spring, and the men seek a restoration of the old rate of wages.

The restoration of the south side of the parish church at Donington, near Spalding, Lincolnshire, has just been commenced by the contractor.

A group of Coastguard buildings, including offices, residences, and houses for the men, have just been built at Buryhead, N.B., under the superintendence of Mr. Bohner, Admiralty inspector. Mr. Jamieson, of Elgin, was the sole contractor.

WATER SUPPLY AND SANITARY MATTERS.

Guildford Sewage Scheme.—A public inquiry was held at Guildford on the 9th inst. by Mr. Arnold Taylor, C.E., of the Local Government Board, on the application of the Guildford Town Council for sanction to borrow £35,000 for purposes of sewerage and sewage-disposal works. The town clerk, who appeared in support of the application, said the matter had been very carefully considered by the town council for several years in order that the sewage might be disposed of without nuisance to anybody. So long ago as 1888 they appointed a committee which visited many places where sewage works were in operation, and came to the conclusion that the sewage should be dealt with by the system of the International Water and Sewage Purification Company which they saw in successful operation at Acton. Under that system the sewage is first treated in precipitation tanks with ferozone to remove the solids, and is then passed through polarite beds, such as are in successful use at Acton, Hendon, and other places. These polarite beds have a remarkable effect in rapidly oxidising the organic matter in solution, and analyses show that this process produces a much purer effluent than can be obtained by any other process. Mr. C. Nicholson Lailey, C.E., of Westminster, as well as other engineers (several of whom recommended the International process), prepared plans of the scheme, and Mr. Lailey's plans were finally selected and accordingly adopted by the sanitary authority. A large landowner having a residence near the proposed outfall works, engaged Mr. Baldwin Latham to consider whether the purification works as recommended by Mr. C. N. Lailey, were likely to cause a nuisance, and it was reported that he had no hesitation in saying that works of this character, if properly designed and carried out and attended to, could be made satisfactorily to deal with the sewage without the slightest nuisance arising even on the land itself. Sir Joseph Bazalgette also reported in favour of the scheme. The inspector expressed his entire approval of the scheme, stating that it was necessary to have the best system because the effluent discharged into the river Wey would ultimately reach the Thames above the water companies' intake. It is intended to proceed with the scheme without delay.

Richmond, Surrey.—A special meeting of the town council was held on Thursday week, for the purpose of hearing the report presented to the council by Mr. J. Lemon, C.E., on the condition of the Richmond sewers. The report stated that the work had not been carried out in accordance with the contract, the examination having proved a considerable absence of concrete, and that there were serious leakages. In conclusion, Mr. Lemon said:—"In placing the foregoing report before your committee, I have dealt with the facts as I have found them. It is a very unsatisfactory record of work improperly performed. I have looked at the question as a drainage engineer, and I have endeavoured to avoid the legal aspect, as that is a question upon which your committee are well advised." It was resolved to give notice to the contractor (Mr. Lewis) to reconstruct, in accordance with the terms of the contract, the defective parts pointed out by Mr. Lemon, and it was further decided to call in an independent engineer to superintend the reconstruction of the works referred to, and of the other work remaining to be executed under the contract. An exciting discussion followed on the following recommendation of the works committee:—"In view of the events which have occurred in relation to these sewers, the committee recommended the council to call upon the borough surveyor (Mr. Brooke) to tender his resignation.—On behalf of the borough surveyor it was urged that the punishment would be too severe, as he would practically be prevented from obtaining any other appointment.—The committee's recommendation was carried by twenty votes to six.

The new schools at Kingston-on-Thames are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Mr. E. H. Shorland, of Manchester.

The Bishop of Hexham and Newcastle has laid the foundation stone of a new convent, to be called the Home of the Good Shepherd, for the reformation of fallen women. The site is Benton Grange, Gosforth, and the cost of the building will be about £4,000. The building, when completed, will accommodate 200 penitents.

The new pavilion on the pier at Rhyl was formally opened on Saturday. Messrs. Darbishire and Smith, of Liverpool, are the architects, and Messrs. Holmes and Green, of the same city, the contractors. The building consists of a hall 50ft. square, with three transepts each 50ft. by 20ft. A ground floor and gallery are seated for 3,000 persons. The building is constructed of wood, iron, and glass, the style is that of the English Renaissance, and the total cost, exclusive of furnishing, will be about £6,000.

LEGAL INTELLIGENCE.

Alleged Breach of Building By-Laws.—At the Epsom Petty Sessions on Monday week, Lewis Monk, jeweller, of High-street, Sutton, was summoned by the Sutton local board for breaches of the 92nd by-law of that board, by erecting a building without depositing plans and sections of the building, either the drainage or water supply; and, further, without giving notice or stating the materials to be used. Mr. Monk, as owner of property in Lind-road, had put up a hay-shed in the rear of those premises without submitting plans, and had tacitly admitted the offence by depositing plans after he had been summoned. Mr. Crickmay, surveyor to the local board, deposed that the defendant had not deposited the necessary plans. Defendant alleged that the whole of the framework of the extension was up 12 months ago, when he was summoned for a like offence, and he had now only covered it in with ironwork. The surveyor admitted that he was not certain the framework was not erected on the occasion of the former prosecution. The Bench dismissed the case.

An Alleged Falsified Time-sheet.—At the Bristol Police-court on the 8th inst., George Hardwick Pearson, a carpenter, was charged, on remand, with attempting to obtain 12s. 3d. by false pretences from Messrs. Lewis and Sons, his masters, on the 28th August, and also with falsifying an account. The prosecutors, contractors, of Clifton, contracted to do alterations to Cheriton House, Westbury-on-Trym. The prisoner was in the employ of Messrs. Lewis as carpenter and joiner, and he was engaged upon the work at Cheriton House at 7½d. an hour. The charge was that the accused had misrepresented the hours he was working to a very material extent, and had also charged for lodgings, whereas he walked to and from his home. Evidence having been given in support of the charge, the accused was committed for trial at the Quarter Sessions, bail being allowed.

Re John Trollope.—A receiving order has been made against this debtor, who is described as of Bond-court, Walbrook, and Lower Walmer, builder. The debts secured and unsecured are returned at £3,000, and assets under £1,000.

The Wesleyan schools which have recently been erected in Clerke-street, Bury, in connection with Union-street chapel, were opened on Tuesday week. The cost of the schools, with the renovation of the chapel, has involved an outlay of £3,000.

William Oakley, the owner of small property at Vauxhall, was summoned to the Lambeth Police-court on Friday, under the Housing of the Working Classes Act, to show cause why an order should not be made against him for the closing of fifteen of his houses as unfit for habitation. Mr. Bolton stated that the defendant was willing to accept the order, and Mr. Brown, after hearing evidence, gave instructions for its issue, and authorised the vestry, besides, to expend not more than £30 in compensating tenants upon removal.

At the monthly meeting of the Cardiff Rural Sanitary Authority on the 9th inst., it was resolved to apply to the Local Goverment Board for urban powers for the licensing and regulation of slaughter-houses in the parishes of Llandaff, Whitechurch, Llanishew, and St. Andrew's. The authority have already acquired urban powers in the whole of their district, comprising 35 parishes, for the regulations of new streets and buildings in accordance with the Model By-laws of the Local Government Board, and the Public Health Acts Amendment Act, 1890.

A memorial mission-room at Kington, Herefordshire, was opened on Friday afternoon. The building measures 54ft. by 22ft. There are chairs for about 150 people. The outer walls are of hammer-dressed face work, in courses, with native stone from the Hergist Quarry, the dressing and tracery being of Uttoxeter stone in red and white. The roof is of open pitch-pine, unstained, and covered with green Westmoreland slate, and a bell-turret is erected at the west end. Wood-block flooring is used for the nave, and the chancel is laid with Godwin's tiles. The room has been built from a design by Mr. F. R. Kempson, of Hereford, by Mr. W. H. Wishlade, of Kington.

At the last meeting of the Bootle town council, a letter from the borough surveyor (Mr. W. N. Blair) was read, replying to the resolution passed at the previous council, that unless he should remove from his present residence at Formby and take up his abode in Bootle within two months' time he should be asked to resign his appointment. The letter dealt with several charges, stated by the writer to have been made against him, in great detail. A long and, at times, heated discussion followed the reading of the letter, an alderman leading off with a strong condemnation of the action of Mr. Blair, who in turn was supported to a large extent in what he had done by a councillor. Ultimately the previous resolution of the council was adhered to by 11 votes to 7.

Our Office Table.

Possibly stimulated by the recent example of the Society of Architects in organising their very successful Belgium trip, the Incorporated Association of Municipal and County Engineers have decided to visit Ireland, for the first time in their history as a body, at the close of next week. The meeting will be held at Dublin on Friday and Saturday in next week, the 25th and 26th inst. The programme for the first day includes a visit to the waterworks for Dublin at Roundwood, near Bray, members to assemble at the Harcourt-street station at the unusually early hour of 7.45 a.m. On their return to Dublin they will dine together at the Hamman Hotel, Upper Sackville-street. On the Saturday the members will meet at 10 a.m. in the council chamber at the City Hall, Cork Hill, Dublin, when the following papers will be read and discussed, viz.:—(*a*) "Sanitary and other works carried out by the Corporation of Dublin," by Mr. Spencer Harty, city engineer; and (*b*) "Road Maintenance," by Mr. R. H. Dorman, county surveyor, Armagh. This will be followed by a reception at the Mansion House, Dawson-street, by the Lord Mayor of Dublin, and Messrs. Guinness, Sons, and Co.'s Brewery, Messrs. Power and Sons' Distillery, and the Port and Dock Works at North Wall, will afterwards be visited.

Mr. Joseph Newton, A.M.I.C.E., who for many years—between thirty and forty—occupied various important posts in Her Majesty's Mint, but who is now living in modest retirement at Herne Hill, writes us to say that he thinks the time has come when a subway should be constructed between the Bank of England and the Mint. At present the whole of the gold imported into the Tower-hill money manufactory, in the shape of ingots, from Threadneedle-street, is conveyed through the crowded streets of the City in common carriers' waggons or carts, just as it was seventy or eighty years ago, when the Mint was built. In a similar primitive way all the coins of gold and of silver forwarded from the Mint to the Bank are jostled through the streets to that institution. A few clerks and porters are sent by the "Old Lady" to keep eye on the rich argosies, which in more troublesome times were guarded by soldiers from the Tower of London. Surely, Mr. Newton remarks, two sister establishments ought in these days of underground railways and electric subways, be made as it were one, by means of a subterranean communication. The cost of such a piece of civil engineering work would be little, in comparison with the value of the tunnel when finished. It should, of course, be of sufficient dimensions to allow of a footway on either side of the tram-rails, for passage to and fro of officials. Electricity both for propulsion and illumination might well be employed, whilst ventilation of a perfect kind could be insured through the agency of the steam-power of the Mint. The arrangement seems to us eminently practical, and we commend it accordingly.

At the closing meeting of the Trade Union Congress at Newcastle, held on Saturday, it was unanimously resolved, on the motion of Mr. Davis, of Hull, seconded by Mr. Malony, of the same town: "That this Congress strongly urges upon all sectional trades employed in the erection of buildings to use their utmost endeavours to eradicate sub-contracting and scamping in the building trade, and that in future the only contract recognised should be either a whole or a joint contract; in case of a joint contract of sectional trades, all the sectional contractors' names should appear on the original contract agreement; and any contract let by the original contractor, after the signing of the original agreement, should be termed a sub-contract, and such sub-contract should not be recognised by the operatives." On the vote being taken for an election of the Parliamentary Committee, it was announced that among the ten names chosen were those of Mr. W. Matkin, of the General Union of Carpenters and Joiners, and Mr. F. Chandler, secretary of the Amalgamated Society of Carpenters and Joiners, who received 147 and 146 votes respectively. As the standing orders of the Congress do not permit two delegates of the same trade to sit on this committee, Mr. Chandler withdrew his name.

A collection of pictures now in course of arrangement at the Birmingham Corporation Art Gallery, which will be opened to the public next week, will include many of the most celebrated works of members of the pre-Raphaelite school. Amongst those lent are the "Strayed Sheep," "The Scapegoat," "Isabella and the Basil Pot," and "The Shadow of Death," all by W. Holman Hunt. Of works by Sir J. E. Millais, the keeper of the gallery has secured seven, including the celebrated "Vale of Rest," which Mr. Henry Tate has presented to the nation with a large number of other works, and the famous pictures "Mariana in the Moated Grange," "The Proscribed Royalist," the very early pre-Raphaelite work "The Blind Girl," a study for the "Huguenots," "The Baptism of Guthrum," and "Greenwich Pensioners at the Tomb of Nelson." The committee have recently acquired for their permanent collection several pictures by well-known artists, including "The Adoration of the Magi," by Burne Jones, A.R.A.; "A Roman Lady," by G. F. Watts, R.A.; "The Last of England," by Ford Madox Brown; "Beata Beatrix," by D. G. Rossetti; "The Doubtful Coin," by J. F. Lewis; "The Widow's Mite," by Sir J. E. Millais; "The Falls of Schaffhausen," by Turner; and water-colour drawings by Aumonier, Albert Goodwin, Mrs. Allingham, and others.

The deaths of two octogenarian sculptors, both of whom owed their early success to Royal favour, are reported this week. Sir John Steell, R.S.A., H.M. Sculptor for Scotland, who died on Friday at Edinburgh, at the age of 87, made his mark in 1833 by a colossal design of "Alexander taming Bucephalus," for which the Board of Manufactures in Edinburgh awarded him a special prize of £50. The work was recently cast in bronze, full size, and erected by public subscription in St. Andrew-square, Edinburgh. One of the first commissions he obtained was from the Board of Works for the erection of the statue of the Queen which is over the entrance to the Royal Institution in Edinburgh. The statue of Sir Walter Scott for the Scott Monument in that city is one of Steell's ablest works. Here a personal acquaintance with Sir Walter no doubt materially assisted him. He also executed the medallion of Sir Walter in Poets' Corner, Westminster Abbey. Steell's works include the statues of Admiral Lord de Saumarez, in the hall of Greenwich Hospital; of the Marquis of Dalhousie, and of the Right Hon. James Wilson, in Calcutta; the equestrian statue of the Duke of Wellington in front of the Register House, Edinburgh, and other statues in the same city to Lord Jeffrey, Professor Wilson, Allan Ramsay, and Dr. Chalmers. He also executed busts of the Queen, the Prince of Wales, the Duke of Edinburgh, De Quincey, and others. Some years ago he executed for the city of New York a statue of Robert Burns, a replica of which was erected in Dundee. His masterpiece is the Scottish national memorial to the late Prince Consort which stands in Charlotte-square. In 1887, in recognition of his eminence as a sculptor, he was granted a pension from the Civil List.

The second sculptor whose death is reported this week is Mr. William Theed. His father, William Theed, R.A., was also a sculptor. The younger Theed, who, like Sir John Steell, was born in 1804, was for some years a pupil of E. H. Baily, R.A., the sculptor of the Nelson statue in Trafalgar-square. At the age of 22 he began a course of study at Rome under Thorwaldsen, John Gibson, Wyatt, and Tenerani. In 1844 Prince Consort requested Gibson to send him designs by English artists in Rome for ten marble statues to be placed at Osborne. Theed took part in the competition with "Narcissus at the Fountain" and "Psyche Lamenting the Loss of Cupid," both of which were adopted. To the same period belong his "Ruth Gleaning," "The Prodigal's Return," and "Rebecca at the Well." In 1848 he returned to London, where his work had already begun to attract attention. On the death of the Prince Consort Mr. Theed was asked by the Queen to execute a life-sized group of herself and His Royal Highness in Early English dress, which the Queen herself named "The Parting." His most important achievements were the statues of the Prince Consort for Coburg and Balmoral, of "Musidora" for Marborough House, of Sir Isaac Newton for Grantham, of the Duchess of Kent for Frogmore, of Henry Hallam for St. Paul's Cathedral, of the late Lord Derby for Liverpool, and of Sir Robert Peel for Huddersfield. He also designed the twelve bronze alto-reliefs from English history in the Prince's Chamber, House of Lords; and the colossal group representing Africa on the Albert Memorial in Hyde Park.

The death is announced from Japan of Shibata Zeshin, the greatest artist in Japanese lacquer, at any rate, so far as we have known by executed works, in Europe. The first of the works of Zeshin to attract attention was painted between 1844 and 1848. It was presented as a votive tablet to the shrine of Inaria, in Oji, a village in the suburbs of Tokio, where it still hangs. Shortly afterwards it was seen by a member of the Matsudaira family, who offered a large sum for it, but the priests did not consider they would be justified in parting with it. Zeshin, who was born 83 years ago, commenced his artistic career at the age of 18 or 19 as a painter of fans, and while pursuing this humble calling his work was of such excellence that the sons of artistic families became his pupils. When his pupils complained of business being slack, Zeshin told them they ought to congratulate themselves, for it was only when the pressure of every-day employment was removed that men could undertake works calculated to establish their reputation. He worked up to five days before his death, and was engaged upon a decorative picture painted on silk of the Japanese Elysian fields, which was almost completed. Examples of his great works in lacquer decoration have been exhibited in Europe.

The New South Wales timber, as our old correspondent "De Libra" points out in another column, offers many advantages to architects for ornamental joinery. The Sydney Architectural Association had a paper read before them lately by J. H. Maiden, F.L.S., curator of the Technological Museum, and consulting botanist to the Forestry Department, in which reference was made to native timbers, including the cedar group, the pine group, walnut substitutes, honeysuckle group, &c. The red cedar has been largely in demand, and is getting scarce. Very fine and beautiful woods for ornamental purposes are to be had. Thus, the rosewood, allied to the cedar, is a wood that combines admirably with black bean and tulip. The black bean is classed as one of the substitutes for walnut. The effect of rose-wood in large masses is to be seen on the premises of the Austral Banking Company. It works easily and shrinks very little, and is an excellent wood for newels, mouldings, and framing. Its price in the log is 15s. per 100ft., and may be had in sizes 12in. to 34in. wide, and 10ft. to 20ft. long. As walnut substitutes, Mr. Maiden recommended black bean, a dark wood, and black wood; the latter is highly valued, and Mr. Allen Ransome speaks highly of it, and says it can be used to advantage in the place of the best Honduras mahogany, and in fittings.

The syllabus of lectures in the Engineering Department of the City of London College has just been issued by the professor, Mr. Henry Adams, M.S.A. The courses comprise thorough and practical instruction in technical drawing and drawing-office practice, building and machine construction, civil engineering, mechanical engineering, quantity surveying, and land surveying and levelling. The classes are all in connection with the Science and Art Department, and are placed at a low fee to enable artisans to avail themselves of the privileges afforded by the College. The numerous valuable scholarships and prizes awarded in connection with the College enable an industrious student to obtain a free education of an advanced character and a large sum for the purchase of books and apparatus.

The builders and contractors of Victoria have formed an association for the protection of their interests, and have already done much to improve the usual conditions of contracting, in spite of two or three of their members who have shown disloyalty to the opinion of the association in a recent contract job at Melbourne, commented on in the pages of our contemporary, the *Australian Builder and Contractor's News*. The members of the association include nearly every "reputable builder" in Melbourne. It is well that contractors should band themselves together to protect their trade and to prevent "undercutting" and other disreputable modes of obtaining contracts, by refusing to tender for work under conditions that are detrimental to

building interests. Those members who set the rules or resolutions of the association at defiance ought to be subject to some penalty, or be struck off the roll of the association.

CHIPS.

The oak screen at St. Stephen's, Clewer, has just been embellished with a set of painted panels by Mr. George Ostrehan. On the men's side are the Four Doctors of the West, and on the women's, St. Mary Magdalen, St. Theresa, St. Elisabeth, and St. Frideswide. The work is harmonious in colour, and extremely careful in design, giving the greatest satisfaction to the donor.

The parish church of Hanmer, Flintshire, which was gutted by fire last year, has been reconstructed from plans by Mr. G. F. Bodley, A.R.A., and will be opened in October. The total cost of restoration has been about £7,000, the whole of which has been raised by voluntary effort. The pews were entirely destroyed by the fire, and will not be replaced, 300 chairs being substituted. The pulpit, font, and choir stalls have still to be erected, and at present service is conducted from the reading desk. The columns have been entirely renewed, and consist of stone hewn from the quarries of the Hon. Mrs. Bulkeley Owen. The builder is Mr. Franklin, of Oxford.

It is stated that Mr. Bazley White, the Member for Gravesend, has definitely decided not to seek re-election, owing to the state of his health. Mr. White is a well-known manufacturer of Portland cement, and is forty-three years old.

A new Roman Catholic Church, dedicated to St. John the Evangelist, has been commenced at Kidsgrove, Staffordshire, from the design of Messrs. W. Sugden and Son, architects, Leek. It is of Perpendicular Gothic character, brick-faced inside, and externally with yellow stone dressings and purple tiled roof. Mr. Bromage, Loughton, is the builder.

The memorial-stone of the new Welholme board schools has been laid at Grimsby. The schools are situated at the extreme Weelsby end of Welholme-road, and are being erected by Mr. Marrows, under the superintendence of Mr. Scaping, successor to Mr. E. W. Farebrother, the board's late architect. The schools will accommodate 750 children.

The new organ which has been erected in High-field church, Southampton, by Messrs. Walker and Sons, of London, at a cost of nearly £1,000, will be opened on Wednesday next.

At a meeting of the York city council, held on Monday, it was decided to send a memorial to the Local Government Board applying for sanction of loans of £1,530 for the purchase of property for the Barker-hill improvement, £1,660 for the purchase of property for the Coppergate improvement, £6,030 for the purchase of property in St. Helen's-square, £352 for the purchase of property for the improvement of Peaseholme-green, £550 for the purchase of land for the extension of Foss Islands depot, £400 for the purchase of land for a tip, £2,200 for the purchase of land for the extension of the cattle market, £4,100 for the purchase of the York Institute, and £6,955 for the Yorkshire Art Institution and the York School of Art.

A new harbour is proposed to be built at White-hills, Banffshire, at a cost of about £9,000. The plans have been prepared by Messrs. D. and T. Stevenson, civil engineers, of Edinburgh.

The west window of Harborough Church has been filled with stained glass, the work of Mr. Kempe, of London. It represents full size SS. George and Margaret.

Mr. R. Ballard, contractor, Child's-hill, has entered upon the construction of the Finchley drainage works, which will cost £18,000 in execution.

Mr. Elliott Beardsell was appointed on Wednesday district surveyor for the central ward of Bradford, Yorks.

The first section of the new railway at Manchester, which completes the circular system between the London-road and the Central stations, will be opened on the 1st prox. It extends from Chorlton (communicating with the Central Station) to Fallowfield. Sir C. Douglas Fox is the engineer, and Mr. J. D. Nowell the contractor.

For a long time past negotiations have been in progress between the town council of Leeds and the owners of the Quebec Estate, a block of buildings which is required to complete an important scheme of street improvements in the heart of the borough. For this block the corporation offered £28,000, which was not entertained by the owners. The Midland Railway Company have now volunteered to give £3,000 towards the purchase money, and a committee of the Leeds town council has recommended that body, in view of this contribution, to increase their offer to £33,000.

Trade News.

WAGES MOVEMENTS.

THE LONDON CARPENTERS' STRIKE.—Matters remain almost in the same position as last week. The masters threaten to escape from the deadlock by importing German labour, and to reduce the pay when shops are reopened by a halfpenny per hour; whereas the men point out that fresh funds are coming in from allied trades and provincial and colonial branches, and boast of being able to hold out for an indefinite period. The amount of strike pay was raised last week from 10s. to 10s. 6d., and this rate will be continued weekly. Should the proposed levies be granted, Mr. Day, chairman of the Amalgamated Society, anticipates that 18s. per week per head will be paid till the strike ends. Demonstrations are arranged to take place on Sunday next on Clerkenwell-green and at Croydon, and on Sunday week, the 27th inst., a grand demonstration of all the building trades will be held in Hyde-park in support of the movement. Several charges of intimidation and following have been dealt with during the week by the Metropolitan police magistrates. At Westminster Police-court Mr. De Rutzen has committed John Bradley for trial, bail being allowed, on a charge of persistently following Thomas Saxby, a man in the employ of Messrs. King and Son, of Vauxhall Bridge-road, with a view to compel him to leave his employment; and at Bow-street Sir John Bridge has ordered Charles Borrow to find sureties for good behaviour during six months for intimidating two men employed by Messrs. Drew and Cadman. —The release on Monday of Alfred Onslow, a carpenter, belonging to the Lambeth Branch of the Amalgamated Union of Carpenters and Joiners, from Wandsworth Gaol, where he had undergone a sentence of five weeks' imprisonment, passed by Sir Peter Edlin for intimidation, was made the occasion of a strike demonstration.

At the last meeting of the Sanitary Committee of the Newcastle Corporation, the question of model lodging-houses was under consideration. The city engineer, Mr. W. G. Laws, was instructed to obtain competitive plans for houses for men and women on a proposed site near the Milk Market.

The tower of the new church at Barmouth, now in course of erection on the Limestone Cliff, overlooking the estuary, collapsed on Saturday, falling upon the nave, which was utterly destroyed. It is estimated that the loss will be upwards of £5,000. Messrs. Douglas and Fordham, of Chester, the architects of the church, attribute the catastrophe entirely to blasting operations with dynamite among the rocks immediately at the back of the church, operations which were undertaken in order to obtain more light for the church. The reconstruction of the tower and building will begin immediately.

The Liverpool City Council adopted, on Wednesday, a resolution requiring contractors for Corporation work to sign an undertaking to pay the rate of wages and observe the hours of labour recommended and agreed upon between Trades Unions and employers respectively, or such rate of wages and bonus as are equivalent or approximate thereto, and that no underletting or assignment of work be allowed in Corporation contracts.

Holloway's Pills.—Indigestion, Stomach, and Liver Complaints.—Persons suffering from any derangements of the liver, stomach, or the organs of digestion should, have recourse to Holloway's Pills, as there is no medicine known that acts on these particular complaints with such certain success. Its peculiar properties strengthen the stomach, increase the appetite, and rouse the sluggish liver.

Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 23, Frith-street, Soho, London, W. Established 50 years.

HAM HILL STONE.
The attention of Architects is specially invited to the Durability and beautiful Colour of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.
Address:—
THE HAM HILL STONE COMPANY,
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent:—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

DOULTING FREESTONE.
THE CHELYNCH STONE.—The Stone from these Quarries is known as the "Weather Beds," and is of very crystalline nature, and undoubtedly one of the most durable Stones in England.
THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.
Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

ABERDARE.—For additions to church for the Rev. Father O'Reilly. Mr. C. C. Jones, 2, Charles-street, Cardiff, architect:—
Morgan, Aberdare (accepted).

BECKENHAM.—For erection of shops, studios, &c., at High street and Albemarle-street, Beckenham, Kent, for Mr. E. Cooper. Mr. G. Warren Cooper, architect. Mr. A. R. Brede, surveyor:—

Charteris	£4,650 0 0
Downs, W.	4,370 0 0
Nightingale, B. E.	4,196 0 0
Brown and Co.	4,150 0 0
Jerrard	4,127 0 0
Higgs	4,070 0 0
Goodall...	4,026 0 0
Pocock	3,933 0 0
Wallis and Son	3,829 0 0
Mid-Kent Building Works ...	3,700 0 0

BECKENHAM.—For erection of coach-houses at the Railway Hotel, Beckenham. Mr. G. Warren Cooper, Bedford-row House, Bedford-row, W.C., architect:—
Webb (accepted) £450 0 0

BIRKENHEAD.—For making a footway from Conway-street to the Inner Drive at the Park, for the town council:—
Forde, W. H. (accepted) £402 15 9

BIRKENHEAD.—For painting and decorating at the town hall, for the town council:—
White, A., and Sons (accepted) ... 500 0 0

BOSTON, LINCOLNSHIRE.—For the extension of the fish quay at the dock, for the harbour commissioners:—
Hinds and Co. (accepted) £1,170 0 0

BRIDPORT.—For the erection of an iron bridge at Cooke's Mill, for the town council:—
Sansom, R R. (accepted).

BRIXTON.—For the erection of a new central library at Brixton for Mr. H. Tate, J.P. Mr. S. R. J. Smith, F.R.I.B.A., architect:—

	A.	B.
Mowlem and Co. ...	£12,578 0 0	... £1,433 0 0
Hall, Bedall, and Co. ...	11,390 0 0	... 1,524 0 0
Candler and Son	11,200 0 0	... 1,500 0 0
Higgs and Hill	10,964 0 0	... 1,490 0 0
Nightingale, B. E. ...	10,950 0 0	... 1,407 0 0
Higgs, F. and H. ...	10,600 0 0	... 1,320 0 0

A.—Building. B.—Fittings.

BRONSIL HOUSE, NEAR LEDBURY.—For drainage works to Bronsil. Mr. G. H. Godsell, Palace-chambers, Hereford, architect:—
Lewis, W. P., and Co., Hereford* £2,200 0 0
(No competition.)
For water supply to Bronsil House:—
Lewis, W. P., and Co., Hereford* .. £197 0 0
(No competition.)
* Accepted.

CARDIFF.—For the erection of a new church for the Rev. Father Butler, exclusive of foundations and priests and boys' sacristies. Mr. C. C. Jones, 2, Charles-street, Cardiff, architect:—
Turner and Sons, Cardiff (accepted) £2,038 0 0

CARDIFF.—For repainting and decorating Cabalva Cathedral-road, Cardiff. Mr. C. C. Jones, 2, Charles-street, Cardiff, architect:—
Banes, Cardiff (accepted).

CLIFTON.—For work in alterations and repairs at No. 31 Berkeley-square, Clifton, to accommodate the Kensington School of Art. Messrs. Trew and Sons, Broad-street, Bristol, architects:—

Thorley, Son and Derrick	£255 15 0
Perry, J. (withdrawn)	217 16 0
Webley, T.	206 6 0
Elmes, G. (accepted)	189 0 0

All of Bristol.

EW STREETS AND THEIR ARCHI-TECTURE.

EMARKABLE changes have taken place in the aspects of several streets in the etropolis by the demolition of old premises d the rebuilding of lofty structures in their ace, and perhaps if we were asked in what anner architecture becomes a factor in our idst of considerable power, we might swer that its objective existence in the ape of buildings erected has an influence good or ill that cannot be ignored. As the tural landscape is made up mainly by trees, ls, and valleys, which constitute its charms power over the mind and imagination, so own is rendered pleasing or disagreeable, ractive or repulsive, by its streets and ildings. To the reader who has travelled all in this country, the impressions made such cities as Birmingham and Manester, Oxford and Winchester, Brighton and urnemouth will appear different, and be ociated with very opposite emotions. In first, lofty, smoke-begrimed warehouses d factories have not a very cheering or hilarating effect on the mind; in the two ond, the beauties of the High-streets will turally captivate and impress the emonal mind; and in the third pair of towns med very different ideas are conjured up. what constitutes the distinctive characistics of these towns? Landscape, of rse, has something to do with it; the figuration of the surface, the hills, and dulations, but architecture mainly—the position of the main streets, the play of set frontage, the skyline produced by the le of the buildings, the factory roofs and cks, the tower, spire, and gable, or the notony of level cornices and windows. en such diverse cities as Shrewsbury and th, Oxford and Brighton, are what they by reason of their architecture, or, rather, ir streets. What very opposite associans are awakened in the mind by Wineet, Bristol, and Pulteney-street, Bath, trasted with the High-street of Oxford, the King's-road, Brighton!

But we are digressing; our object is to nt out the great transformation made by ew changes in our main streets. During last ten years London has changed nensely—we will not say altogether for better. Large areas of closely-built ses and shops have been pulled down or through by such "improvements" as se made by Shaftesbury-avenue, Charing ss-road, Clerkenwell-road, and Gray's n-road, and these have no doubt resulted throwing open to light and air many rts and alleys which were deprived of se indispensable elements of health. It is ir incomplete, half-finished appearance t is so distractive and unsightly. do not find fault with the clear- e of unhealthful and insanitary areas; with hideous malformations, the ightly erections, and the acres of desolate tes of brick and mortar and hoarded osures which meet us on all hands. we regard with any complacency the tes and rubbish heaps which still spoil s of Charing Cross-road and Clerken- ?

nest of closely packed and unsanitary llings between Long Acre and the Strand anded immediate attention, and the of Clare Market, between Gilbert- et and Vere-street, has been cleared nany old and dilapidated houses. A l clearance was called for here. A few old "bulk shops" still remain on the south side, and in Gilbert-passage, Clare, Holles, and Haughton-streets, leading out of Clare Market, named after the titles of the Earls of Clare, are old and dilapidated houses with but few traces of any interest externally. Pepys, in his Diary, mentions a theatre in Gibbons-court which he says "was the finest play-house, I believe, that ever was in England." The butchers of Clare Market were noted for their theatrical proclivities, and Joe Miller, the comedian, is said to have been a frequenter of an inn in Portsmouth-street. Notwithstanding its past associations, the market has long been one of the most squalid and unsavoury localities. To sweep away the neighbourhood, therefore, cannot be any loss if its site can be dealt with satisfactorily. It is asserted that stables for Messrs. W. H. Smith and Son are to be erected on the vacant area.

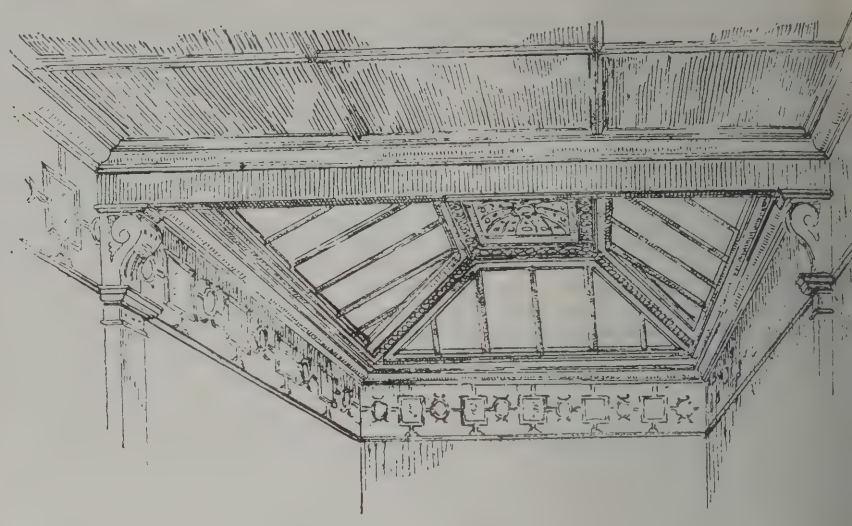
In connection with this locality was the proposal of the Improvement Committee of the County Council to run a street from the corner of the Strand and Catherine-street in a northerly direction into High Holborn; but this scheme has at least been postponed for the present. A more direct communication between these main arteries than the long detour by way of Wellington-street, Bow-street, and Great Queen-street is certainly necessary; and we should prefer a street commencing a little further eastwards, say from Newcastle-street, cutting Vere-street, and taking the western side of Lincoln's Inn-fields, as a more right-angled and agreeable thoroughfare. Oblique lines are objectionable, especially when they make acute angles and leave triangular spaces to fill up. Many unsightly inclosures of this kind are to be seen where recent streets have been made. These plots remain unlet for a considerable time, perhaps years, and become refuse receptacles. The completed scheme is deferred, the architectural aspect of the whole thoroughfare being broken and confused by these gaps.

The architecture of the new streets has been greatly affected by these irregularities, and also by the fact that the plots let for building are often so restricted in depth that only a frontage of considerable elevation can be erected to make the outlay remunerative. Here we have one of the most detrimental circumstances in connection with street alterations in the Metropolis. A road is generally widened by demolishing the old premises on one side, and therefore the depth of plots on that side is reduced in consequence so much, that in some cases there is little courtyard left. As the ground-rent is heavy, a new building is carried up several additional stories. The evil consequence of this increase of height is that a very inadequate depth is given to the building to avoid the obstruction of the "ancient lights" in the rear. We see the result in those ungainly-looking buildings—all front—which we meet with in nearly every new, or widened, thoroughfare. A flagrant instance may be seen in Charing Cross-road. Looking southwards, with St. Martin's Church steeple and the back of the National Gallery in the distance, the eye cannot fail to be arrested by the side view on the left of a shallow recent building, which has more the appearance of the end of a huge wall, or buttress. The sectional view of the roof, instead of being of equal rafters, presents a long slope behind, and a very short one in front, giving the effect of a sloped weathering, the object being evidently to give the rays of light a fair angle to the premises in the rear. This unsightly erection is likely to remain an eyesore for a long time to come, and its ungainly blank party-wall, which out-tops the adjacent buildings, makes a most unpleasant object in the vista towards the south. A more execrable "skyline" perhaps it would be difficult to conceive. Similar eyesores are to be found in many other new streets, as at the reconstructed junction of Shaftesbury-avenue and Oxford-street. The mischief is that they give an unfortunate impression. The old buildings were at least picturesque; these are positively ugly.

The architectural features of this new western thoroughfare are scarcely equal to what might have been expected. What a fine opportunity there was, for instance, to do something really architectural at the corner of St. Martin's-lane and Charing Cross-road facing the back of the National Gallery. The curved frontage is certainly unfortunate, as it is not a regular one, and the new façade of St. Martin's-in-the-Fields Town Hall does not happily align with anything. The edifice, though of stone with an upper order of pilasters, has a flat superficial appearance, owing to a want of well-accentuated breaks which would have been valuable as carrying down the lines of the domical pavilion roofs of zinc, at the ends. These latter look somewhat attenuated. Assuredly, solidity and strength might have been given to this building by a more broken frontage—by deeper reveals to the windows and less meagre detail. The vestibule entrance is certainly poor. Adjoining it is a number of buildings of more or less pretensions on a flat curve. The Garrick Theatre has been followed by several business premises. Next to it is a gabled front of brick, with a stone basement and mezzanine. The gable end is simply treated, the upper story broken by small brick piers between the windows. Then follows a warm sandstone front, that of Szerelmey's premises (Faraday House), a quietly-treated façade divided by wide stone piers with mullioned windows. Next door a large red brick house of six stories over shop, surmounted by a richly-carved brick gable, is built. A flat bay window is shown on one side. Paternoster House, the new premises of Kegan Paul and Co. has also a very flat bay window supported on the stone head of doorway. This "sailing" over of the brick front is scarcely justifiable, though it gives relief to an otherwise flat front. The corner premises, known as Charing-cross Mansions, are extremely flat and ugly. On the opposite side of the way is Newbery House, the premises of Messrs. Griffith, Farran, Okeden, and Welsh, a red brick and stone structure, crowded by small windows, divided by stone piers, and a corner extension of the same premises is being carried out, though in a rather different style, with a circular oriel at the angle. With this exception the western side of the road at this end presents a row of old and dilapidated premises without any interest. Passing northwards, we come to the row of barrack-like buildings called Sandringham Buildings, erected by the "Improved Industrial Dwellings Co." some years ago, a dark, dingy row of flats with shops beneath, which materially spoils the effect of the new road. One regrets that D'Oyley Carte's new theatre could not have been placed somewhere nearer the south end of the road, to give it a little character. The observer is struck by the extremely heterogeneous composition of the street, owing to the admixture of old houses and new business premises. As we go further north the architecture somewhat improves, red brick and terracotta appear to predominate over the stone, and some effective business premises are those of Messrs. Crosse and Blackwell. But on the whole the new road cannot be called an architectural success, the skyline is at points painfully harsh and disagreeable, and as we pass Shaftesbury Avenue and come in view of the busy intersection of Oxford-street and Tottenham Court-road with its unpicturesque and prosaic assemblage of gables and roofs, we are compelled to admit that the new thoroughfare is devoid of those features of interest and beauty which distinguish the older streets. At the southern end a very glaring

disfigurement will happily be removed by the erection of a new building masking the rear wall of the National Gallery, and which is destined for the National Portrait Gallery. The north elevation, and adjoining sculpture gallery, designed by Mr. Ewan Christian, we illustrated on July 10, from which it will be seen that the Greek design of the old building is preserved along the east front, but the north block is in a freer style—an Italian or Romanesque treatment. By this masking the blank walls of the National Gallery, which now present a very barren and unsightly appearance to the entrance of this thoroughfare at the north end, will be transformed, and the vista southwards be rendered more worthy of the neighbourhood.

FREE PUBLIC LIBRARIES—XVI.



PARTIAL TOP-LIGHTS.

WE spoke in our last article (section Glazed Roofs) of plans for news and reading-rooms on the ground floor, in which top-light could only be partially obtained by reason of an upper story being desirable over a portion of their area. Many recently built libraries have this arrangement, the main object of which is to secure ample light at the inner part of the room furthest from the front windows. Architecturally, this combination of top and side lights is open to the objection that it has rather a make-shift appearance; the skylight, wherever it is placed, looks rather like an afterthought, especially if a flat ceiling is carried throughout the room with an ordinary trimmed skylight in it. This effect somewhat mars the appearance of the interior of the newly-erected library in St. Martin's-lane, the upper room of which has a large flat ceiling, broken by skylights. One method of avoiding the unsatisfactory effect of this plan is to boldly pronounce the top-light by making it either a distinctive feature like a lantern, or to cut off the skylighted portion from the flat ceiling by a beam. For example, the ceiling of the room may be divided into compartments or panels by cross beams, and one of these be given up to the top-light, as in the sketch we give. In this manner the ceiling appears to be a studied design, and a more architectural finish is given to the room. The beam represented may be a concealed girder carrying the outer wall of the room above, and therefore it has a useful as well as decorative purpose.

ALCOVE LIGHTING.

Sometimes an alcove or recess may be made a useful addition to a news or reading-room. These may be square, semicircular, or octagonal. It would be easy to arrange an inner alcove underneath a top light of this kind by the addition of a few columns, and thereby create a pleasing feature out of a necessity. If the recess is thrown out as a bay from the wall of room, it would be easy to have a circular or octagonal lantern over it, half of which would cover the recess and the other half project into the room. A skilful architect will find other methods of making top-lights a feature.

Alcoves may often be a desirable mode of utilising the inner side of a news or reading-room where top-light can be obtained. A series of alcoves, for example, along the side can be lighted by a skylight, or by several separate lights. When a window cannot be introduced in each alcove, the above plan secures the requisite light, without which the alcove system is objectionable. For example, along the blank wall of a reading-room a number of bookcases, 8ft. high, placed at right angles to the wall at a convenient distance apart, will form a series of alcoves, and may be lighted by one long skylight overhead, or by separate lights, and in this manner a wide room with windows

on one side can be made comfortable and pleasing.

HIPPED SKYLIGHTS.

When a reading or news-room on the ground floor has an area for light over a portion of it, or is inclosed by buildings, the top light may, with advantage, occupy the whole width of the room, as in the form sketched in our illustration. A plain hipped lantern, formed by angle hip rafters, with glazed lights in each of the sides as shown, is a good and economical form. The apex may be cut-off with a square ceiling, which can be utilised for ventilation, one of Boyle's air-pump ventilators or other outlet being fixed at the external apex. Inside one of Strode and Co.'s ventilating sun burners can be placed below. By thus cutting off the apex internally, an architectural character can be given; the angle ribs ought to be massive and moulded, or enriched on the soffit, and the level soffit at the apex be also surrounded by a margin and enriched. The intervening bars of the side-glazed lights should be of large section and moulded. An octagonal-shaped lantern admits of similar construction, the cardinal sides of octagon being coincident with the sides of the compartment, in which case it is only necessary to cut off the four angles by beams, and allow the hip rafters to start from the angles. We will show a few arrangements of this kind. Lanterns occupying the entire width and area of the compartment have an imposing appearance: they allow the whole external area to be utilised, and thus give more light than a small skylight on either side of a span-roof or a flat ceiling light, as we often see in buildings of this kind. The only expense is in making the angle-hips massive, and in casing them with plaster internally.

DECORATIVE JOINERY.

FEW things add more to the interior effect of a building than the woodwork. One of the reasons is that the joiners' work accentuates the points which most frequently arrest the eye—the doors, the windows, the floor, and wall linings; another reason is that the tone of the woodwork is generally a little darker than the walls or ceilings, and, therefore, draws attention to itself. The old conventional rules of painting, which made doors and skirtings appear as if they were made of the same material as the walls, by painting them stone colour or drab of two shades to represent stone or marble, was destructive alike of good joinery and of decoration. It was one of the traditions of Classical architecture, and lingered long in buildings erected during the 18th and the early part of the present century. Good joiners' work lasted so long as materials and labour were measured and valued, but the co system considerably altered the state case; the trade began to lose heart in work. They began to see that their and skill were thrown away, or were n in the same esteem as that of the pai grainer. To a partial extent we are ning to discover the mistake of conc behind a film of paint the beauty of work, a discovery partly attributed revival of art and the industries con with wood-working. The chief oppone been the cheap contractor, who has been an advocate for paint as a cove substitute for the real thing. From work in the flat, the fashion towards "grained" work, till the Revival brought with it the ine reaction against shams. Both stuc paint were condemned. It was anath use anything that imitated or conceale like all reactions, the opposite extre inculcated of exposing the material, structure, however unsightly. Fro time, woodwork, happily, regained portance, and began to be regarde feature of buildings. The plaster were stripped off church roofs, and unwrought timbers exposed; the grai painted, pews of churches gave place stained and varnished benches; pu the old three-decked type and galleri removed. The change, of course, with it a new industry—church furn Oak and deal fittings, from benches t pulpits and lecterns, communion tab other furniture became a special tra were introduced in catalogues. D work followed suit. We have now nu firms who contract to supply domestic doors, dadoes, parquet, chimneypie overmantels in which oak and wal other special woods are introduce "Queen Anne" architects have ass develop this ornamental joinery, names of Nesfield, Mr. Norman Sha Edis, Mr. T. G. Jackson, Messrs. Gee Peto, and others, are associated w revival of woodwork. The decorativ ment of joinery is largely indebted gentlemen, and to their efforts we introduction of many hard woods quetry, for example, either as solid ¼in. thick, has been very extensiv ployed during the last few years. added a great charm to the artistic rooms, and the manufacture of it has a degree of excellence which will favourably with the best foreign and work. Thin parquet can be empl cover old floors in a manner economical and durable by m tonguing and backing, which strength to the parquet, and render fectly independent of the sub-floor, as lately shown. Laminæ of parque

used for wall linings, panels, and ceilings. ahogany, wainscot, walnut, teak, and other rd woods enable the architect to produce a corative effect which no painted woodwork s capable of giving. The use of orna- ntal and hard woods for framing, over- rs and overmantels, and other indoor nery has also received an impetus. The lonial and American exhibits, especially se from Canada, in the recent Exhibition South Kensington showed the capabilities hard wood for decorative joinery. We do mean to say that these specimens were d examples from an artistic point of w, but they exhibited the progress made workmanship, and the pleasing combina- ns of woods in framed work. Highly orative results were shown in red cedar, ewood, black bean, tulip, and other oured woods. The exhibits from South stralia and New South Wales, including ironbark—a very heavy and hard wood— satin-like milkwood, used for bedroom niture, which takes a good polish, the neysuckle, and various species of eucalyp- , were both interesting and instructive. e working qualities of many of these onial timbers have been shown to be rthy the attention of architects. We have, instance, the jarrah wood of Western stralia, now in much repute, although wn and tried many years ago, and with ich the roof of Herne Church, in Kent, has nreroofed. In the experiments undertaken Messrs. Ransome, of Chelsea, many of se hard and decorative woods left their chines with a very clean, smooth finish. aight and circular mouldings were also ned out with excellent finish without the of sandpaper. These woods are destined ore very long to take the place of the inary materials, and they are only aiting the attention of architects.

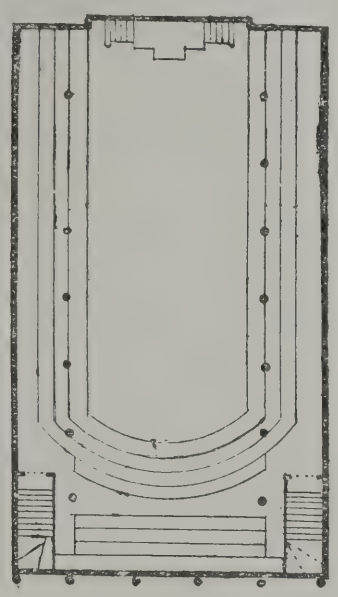
The reports published some time ago by ssrs. Ransome show how excellently many the hardwoods of the Australasian colonies n be worked and adapted. Last week we blished a letter from Mr. James Green, of *Australian Builder and Contractors' News*, lney, New South Wales, in which he calls ention to the value of the hardwood and amental timbers of Australia, and also to aper on "Some Ornamental New South les Timbers," read before the Sydney chitectural Association by Mr. J. H. iden, F.L.S., curator of the Sydney hnological Museum, to which we briefly erred last week. A technical knowledge the Australian ornamental woods is not perfectly acquired; it is of interest to w that the Forestry Department of New th Wales established by Sir Henry Parkes aking the matter in hand, and we may k for the time when ornamental joinery l become a greater accessory to interior oration than it is at present.

NONCONFORMIST CHURCH BUILDING.*

By James Cubitt.

CHAPTER III. (*continued*).

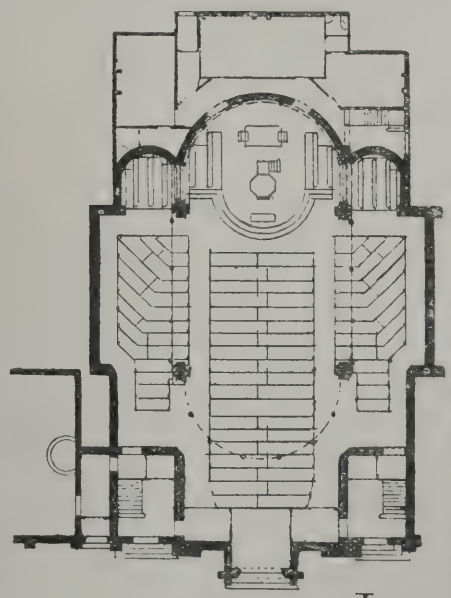
2. ARRANGEMENT OF PLAN.



(b) Plans Suitable for Galleried Churches.

WE pass now from the cases in which the whole congregation is placed in the ound-floor area, or in which there is, at st, only a small end gallery, to those in ich there are galleries, or a continuous lery, round most of the interior. With s change of type, many plans otherwise d become unsuitable. Some of them, en galleries are added, prove inconvenient; ile others become ill-proportioned and rtistic. The unfortunate thing is, that se evils do not keep such plans from being

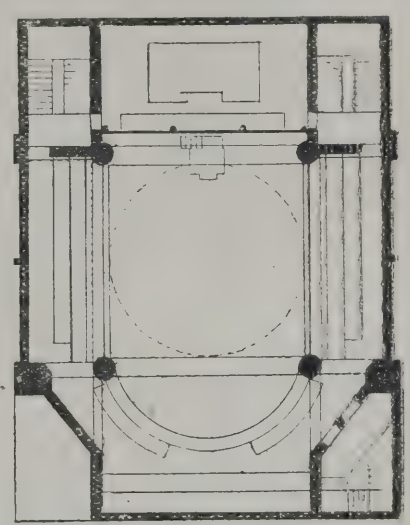
* All rights reserved.



used and re-used for galleried buildings. Few people seem to suspect that any special treatment is desirable or even possible for such places. Hence galleries have got a bad name, and people who pretend to taste often assert that where there are galleries good architecture is impossible.

All this arises from the fact that in the

The Meeting-house Gallery."



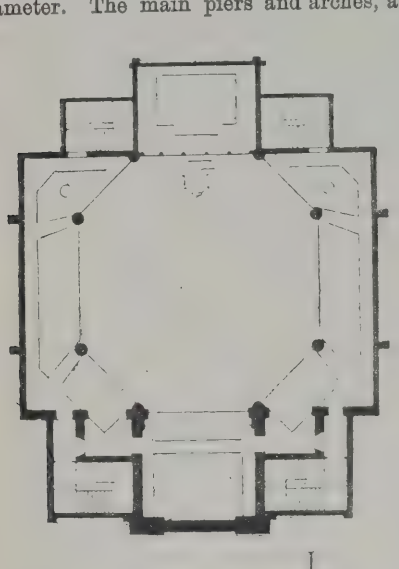
dark ages of Nonconformist church building, when there was little care for convenience and none at all for beauty, a clumsy and awkward type of gallery came into use. This type, as it showed itself in the meeting-houses of the last century, we may call the "meeting-house gallery." It is about the crudest attempt ever made at providing seats for a certain number of people over the heads

J

of the rest; and yet, so powerful is the influence of habit and custom, that in multitudes of cases it is repeated to this day. It is a failure practically, and a horror artistically. It is of the wrong shape, to begin with. The people at the sides look across at each other, and, near the further end, cannot turn towards the pulpit without discomfort. It covers up too much of the ground-floor area, and leaves too little open space. If the roof is in one span, it generally comes down close upon the side-galleries, and still more upon the end gallery, so that the occupants are half-suffocated with the hot and vitiated air from below. If, on the contrary, the roof is carried by columns (as in the above plan of "a meeting-house gallery"), these columns are numerous enough to be considerably in the way. These are merely some of the material evils of the type. Its artistic faults are unpardonable. Its shape on plan has no relation to that of the building it is thrust into. It is a gigantic misfit. And it looks far worse in modern Nonconformist structures than in ancient ones. There its uncouthness only matched the uncouthness around it. But thrust into a modern church and decked out with an "ornamental" front, it is indeed a thing to make the judicious grieve.

A mere oblong plan, whether divided lengthwise by rows of columns, or roofed without them, from wall to wall, is seldom well adapted for galleries. What galleried churches need is rather width than length. They need plenty of air, plenty of light, plenty of open space for the people below. Then, again, both the people in the area and those in the gallery should be grouped around the pulpit, and able to face towards it without discomfort. In other

K



words, the typical galleried church should be more or less of the "central area" form, like those of the plans J, K, and L, and not of the oblong or "avenue" form already shown in D and E, as well as in the above example of the "meeting-house gallery."

The church whose ground plan is sketched at J has three galleries, indicated by dotted lines. They are supported by granite shafts with moulded arches of stone. The four main piers carry an octagonal lantern-tower, about 36ft. in outside diameter and 140ft. high. This, which is roofed internally at rather more than 50ft. from the floor, is pierced with sixteen large lancet windows. The main light is thus concentrated on the central space around and in front of the pulpit. Special care was taken to prevent echo and reverberation, and the building is considered a good one for speaking in. A glance at the plan will show that the piers scarcely obstruct the view from any of the seats.

The plan marked K is that of a much smaller building than the last. It occupies, and all but fills, a very contracted site, shut in on three sides by lofty houses. No light could be obtained from either end, and very little from the wall to the left. In this case, therefore, a lantern-tower was placed over the central area, and by it, aided by the

windows in the street-front, the place is lighted. The galleries rest on stone arcades. The main arches are pointed, and above them, the square central space is brought into a circular form by means of spherical pendentives.

L is the gallery plan of a large church, seating altogether 1,600 persons. The central area here is an octagon of 60ft. in diameter. The main piers and arches, and

L

the arcades below the galleries, are all of stone; but from the pews there is hardly any obstruction to the view of the pulpit. The organ, partly sunk below the floor, so as to give abundance of height for the development of sound above the tops of the pipes, stands in a recess more than 30ft. wide, at the further end of the church. Staircases adjoin each corner of the building. The tower, in the centre of the front, is not simply a feature added for ornament. On the contrary, it contains no fewer than 240 sittings —95 on the ground floor, and 145 in the tower gallery, and forms as important an adjunct to the interior as to the exterior of the building. The idea was partly to make the tower pay a large proportion of its own cost, by the practical use which was thus made of it, and partly to avoid putting up the usual slender imitation of a church belfry-tower and spire. *That* groove, in Nonconformist practice, has really been run in a little too long, and worn a little too deep.

The above are only a few of the endless varieties into which central-area plans may be shaped. The central-area type, in others of its forms, can be equally well adapted to wood, or to iron construction. The larger a building is, the more useful this type will be found, because on it more than on any other, the whole congregation can be kept within easy range of the minister's voice. No doubt it presents the architect with many problems, and problems for which there are no ready-made solutions; but this is only another way of saying that it will make for interest, freshness, and originality.

Some of the commonest sins of the ordinary gallery against practical convenience and against sanitary laws have already been noticed. Far too little breathing space is often given above the top level, especially where one roof extends from wall to wall. The columns, again, if they are in the regular two rows from end to end of the building (another long-travelled and deeply-channelled groove), cause even more obstruction to sight in the side galleries than on the ground floor. And still further, it is not a very rare thing to find the levels of the gallery seats so managed that the people behind can neither see nor hear the speaker. In most cases a little care will prevent this evil. It can only become a serious difficulty where there are side galleries, and where, at the same time, the pulpit is not on the central line of the building: so that this particular combination is not often to be recommended. Galleries, again, which are divided into many widely-separated sections, are not beloved by preachers, one of whom complained some time since that half his congregation were peeping out of holes and corners, or were perched in unexpected positions about the roof.

THE SYMBOLISM AND ICONOGRAPHY OF EARLY AND MEDIÆVAL CHRISTIAN ART.—XVII.

By GEORGE ASHDOWN AUDSLEY, F.R.I.B.A.
(Author of "Handbook of Christian Symbolism," and several works on Architecture and Art.)

THE ICONOGRAPHY OF THE CREATION.

THERE are no biblical subjects which have called forth the imagination and skill of mediæval painters and sculptors, in which we should expect to find God the Father—the Creator—more directly and clearly indicated in portraiture than in the great scenes of the Creation of the World. In these scenes, whatever may have been the practice of artists, oppressed more or less with traditional and personal timidity and awe, it was incorrect to depict any Person of the Trinity save God the Father. We have already pointed out that the Creator was frequently and in certain periods invariably represented under the portraiture of God the Son—or, at all events, by a figure which art has recognised as that appropriate for the Second Person of the Trinity.

In the interesting series of subjects setting forth the different acts of Creation, as described in the Old Testament, which adorn the nave walls of the Cathedral of Monreale, near Palermo, and which it is now our pleasing task to illustrate and describe, the portraiture of the Creator is of that youthful, bearded type alluded to in our preceding article (XVI.) as appropriate, according to the accepted canons of art, to God the Son. On carefully examining the entire series of mosaic pictures which cover the walls of this remarkable church, we find that the countenance of the Creator, in the scenes of the Creation, whilst not precisely the same, very closely resembles that given to Jesus Christ in the scenes of His Ministry and Passion. It must be noted, however, that the nimbus which invests the head of the Creator is circular with a perfectly plain field, whilst that investing the head of Christ is invariably tri-radiated. The reasons for this distinctive treatment are of course open to question, but to us they seem quite plain. In the case of the Creator no special indication of the Trinity seemed called for—the power of the Deity was manifest; but in the case of the Saviour, who appeared as a man amongst men, there was every necessity, in view of the universal teaching of the Church, for clearly marking Him as one of the Persons of the Trinity, invested with the full authority of the Godhead. It seems quite evident, we venture to think, that the artists of the Monreale mosaics sought to distinguish between their portraitures of God the Creator and God the Saviour, whilst they hardly ventured to depart from the early custom of depicting the Creator in the form of a young man resembling the accepted portraiture of Christ. In the preceding article we have spoken at some length respecting this early custom; but before entering on the chief subject of the present article, we may add to what has been already said the following remarks by Lady Eastlake in "The History of Our Lord." "The connection between the History of the Creation and the History of our Lord is immediate. In all religious Art, as in all sound theology, Christ is the Creator, in the active and visible sense, o the First Day, as truly as He will be Judg on the Last Day. This doctrine is frequent asserted in the Scriptures—indirectly in t Old Testament, directly in the New. God declaration to Moses, 'For there sha no man see me and live' (Ex. xxxiii. 20 shows that His appearances to Ada and to the patriarchs were not in H own person. This declaration is repeat in the broadest terms in the New Test ment, 'No man hath seen God at a time' (St. John i. 18). The direct asserti that the powers of creation were vested the person of Christ is also contained in t words commencing the Gospel of St. Joh 'In the beginning was the Word, and t Word was with God, and the Word w God. The same was in the beginning wi God. All things were made by him; a without him was not anything made th was made.' This all-embracing authori for the chief mysteries of our faith is aga repeated by St. Paul as regards the creato ship of Christ, 'And to make all men s what is the fellowship of the mystery, whi from the beginning of the world hath be hid in God, who created all things by Jes Christ.' (Eph. iii. 9.) Finally, such bei the warrant for this dogma, it takes place among the articles of the Nice Creed, 'Being of one substance with t Father; By whom all things were mad Here, therefore, we find full indication the system of early Art, which, with revere consistency, never represented the Person the Father, except by the Hand from t cloud, or from a portion of the circle whi typifies heaven; and which invariably sho us the Son, 'the express image of t Father,' as the outward and visible ma festation of God, whether in the creation the world and of our race, or in the varic other occasions, in the Old Testament, wh the presence of the Almighty is made kno to man."

The student of Christian Iconograp must bear in mind that such remarks only apply, so far as Art is concerned, *early* art; and in arriving at a reasona conclusion regarding the intention of t early artists, in Old Testament subjects will also be well to bear in mind one fac namely, that as God the Son is "the expr image of the Father," those artists, essaying to depict God the Father, co only represent Him as identical in appe ance with God the Son. A noteworthy ample of this is to be seen in Fig. 5, Arti V. It hardly follows, we think, that wh we find the Creator, in the scenes of Creation of the World, represented by figure strongly or even perfectly resembli that which appears in portraitures of Chri we are immediately to say that the ar intended to convey the direct idea that G the Son was alone the Creator of the Wor Didron's words should be remembered such a juncture: "It is easy to understa how the Father, the Son, and the Holy Sp might concur in the same actions, and ma fest themselves at the same time in various events recorded in the Old Tes ment, because the Trinity is doctrina indivisible, and every act performed by of the Persons is performed collectively the three Persons of the Trinity. From moment, however, that a single Person represented in art, it would seem fit t God the Father alone should be shown in scenes of the Creation, just as God the S should appear in the scenes of His Passi and God the Holy Ghost at Pentecost."

It is in this reasonable light that we l upon the scenes of the Creation, in Cathedral of Monreale; and we do not thi simply because the portraitures of Creator bear a general likeness to those Jesus Christ, in certain other mosaics, t the artist had any desire to convey the i that God the Son was alone the Creato

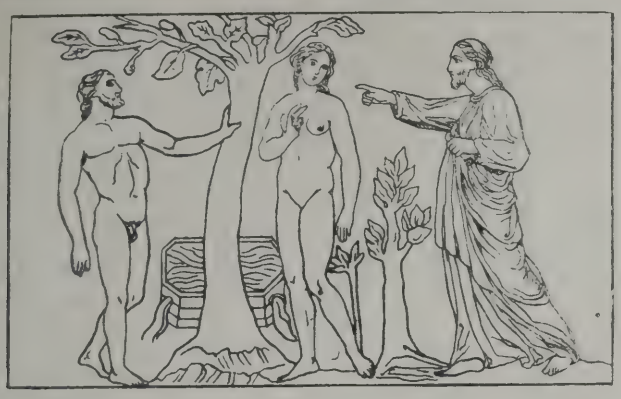


Fig. 51.

he World. Had he intended to convey the dea, why did he omit the tri-radiated imbus, which, in the scenes from the New estament history, invariably distinguishes esus Christ?

In the bas-reliefs of the Creation, by Nicola Pisano and his pupils, in the Cathedral f Orvieto (13th century), the Creator is epresented in the form of a man whose age ight be about thirty. At all events, He ppears no older than Adam, whom He reates. His head is not invested with a imbus of any kind. In the accompanying lustration, Fig. 51, which is copied from he bas-relief of God appearing to Adam and ve after the Fall, at Orvieto, it will be een that the Creator appears in the form s above described.

The figures of the Creator in Ghiberti's elebrated bronze doors of the Baptistery of lorence, are in the form of a man of iddle age, with a dignified and thoughtful ast of countenance; both hair and beard re long and flowing. Adam appears as a uch younger figure. In the fresco painting f the Creation of Adam and Eve, by Michael ngelo, in the Sistine Chapel in the Vatican, he Creator appears as a man of venerable ountenance, especially so in the picture of he Creation of Eve. His form is robust, s if full of years, and His hair is flowing, nd His beard is long. The figure is here illy draped. In the Creation of Adam, the reator is a robust figure, lightly draped, ith arms and legs almost entirely un-overed. His hair and beard are not so long s in the other subject. He appears upported and reclining on wingless and outhful angels, with a background of flowing rapery. In the fresco by Raphael, in the atican, in which God appears to Abraham, he Deity has the form of an aged man with strongly-marked countenance replete with ignity. In none of the instances just entioned does the portraiture of God the ather appear invested with a nimbus.

In the following brief remarks respecting he Days or Scenes of the Creation, as ndered in Christian Art, we shall specially eat of the interesting series of mosaic ctures on the nave walls of the Cathedral Monreale; but we shall also allude to her series, the details of which may help s to elucidate the subject under review.

FIRST SUBJECT.

Text.—"In the beginning God created the eaven and the earth. And the earth was without rm and void; and darkness was upon the face of e deep. And the Spirit of God moved upon the ce of the waters."

It will be seen on an examination of the companying illustration, Fig. 52, the first the series at Monreale, how literally the tist has rendered, in the symbolic language Christian Art, the idea conveyed by the ove text. In the upper part of the sub-ct the figure of the Creator is represented if issuing from, and upheld by, the symbol eternity, the circle of heaven. His head invested by a plain circular nimbus, and His open hands are stretched out towards the "face of the deep." Falling vertically from His breast are three parallel rays, joined in one, and doubtless intended to express the Triune. Descending on the rays is a dove invested with a plain circular nimbus, the symbol of God the Holy Ghost—"the Spirit of God" moving "upon the face of the waters." Immediately above the "deep" and the "waters," which occupy nearly all the lower half of the subject, is a broad dark band, evidently intended by the artist to express the idea conveyed in the words "darkness was upon the face of the deep." We now come to what is at once the most curious and the most perplexing feature of

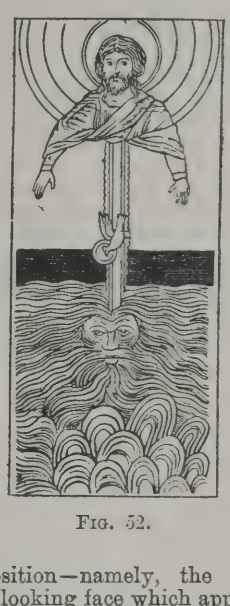

Fig. 52.

the composition—namely, the mysterious and angry-looking face which appears in the waters, with its hair and beard of flowing waves: it will be observed that the descending rays fall directly above the face. Different opinions have been hazarded as to the signification of this water-born countenance. Lady Eastlake, in speaking of this interesting mosaic, remarks: "This head, or rather face, may be considered at first sight a relic of that classic impersonation which clothed the elements of nature in human forms. But it is far more probably an attempt to literalise the very words of Genesis—the same in Hebrew, in Greek, and in Latin, as in English—'the *face* of the waters.' In the Hebrew Bible and in Symmachus (Greek Bible) the word used both for the 'face of the deep' and the 'face of the waters' is the same figurative term, put instead of surface. In the Septuagint, and in the Vulgate, the word face is applied to the deep 'super faciem abyssi,' but not in the second passage, which is thus expressed, 'Spiritus Sanctus ferebatur super aquas.'" We here hazard the conjecture that the artist's intention, in forming a face, with its watery hair and beard, in the midst of the previously silent and motionless waters, was to indicate that life and motion were imparted to them by the Spirit of God moving on their surface. This reading of the artist's aim seems to be supported by the fact that the face appears immediately under the rays which descend from God, and on which the Divine Dove is shown descending. In no other pictorial rendering of the words, "And the Spirit of God moved upon the face of the waters"—"Spiritus Dei ferebatur super aquas"—known to us does a face or anything resembling a disturbance appear in the waters upon which the Spirit of God is represented moving.

Didron gives a very curious illustration, taken from a miniature of the 14th century. In this picture, God, in the likeness of the Son, invested with the tri-radiated nimbus, and bearing the orb (see Article VI.), is shown in the act of creating two circular bodies or discs, one dark and the other light. Didron interprets this subject as the creation of heaven and the earth; but we are inclined to accept it as the creation of light, and the division of the light from the darkness (Gen. i. 3, 4). Whatever the true intention of the artist may have been, the portion of the subject which claims our special attention is that in which the Spirit of God is shown moving on the face of the waters. About the centre of the picture, and midway between the two discs, appears a horizontal band, marked with waves, and, of course, indicating the watery deep. Upon the surface of these waters is depicted a naked infant invested with the tri-radiated nimbus. Instead of the usual symbol—the Divine Dove—the Holy Spirit is here portrayed as a newly-born child floating on the surface of the waters.

If we turn to the quaint and interesting pages of "Cædmon's Metrical Paraphrase of Scripture History," an illuminated manuscript of the 10th century, preserved in the Bodleian Library at Oxford, we find a highly curious subject, commonly designated "The Uprearing of the Firmament," and "the Spirit of God upon the Deep." The general treatment of the subject is noteworthy and interesting to the iconographist. It consists of the greater portions of two large discs, the lower being in front of, and partly overlapping, the upper disc. Seated on the edge of the lower disc, and nearly in the centre of the composition, is the figure of God the Creator, youthful, beardless, invested with the divine nimbus, and pointing downwards with His left hand. Above this figure is an angel holding a hollow vessel, inverted, from which issue diverging rays of light. The lower disc seems to sink, to nearly the extent of one half, behind what is evidently intended for "the waters" or "the deep." Issuing from this is an angel with outspread wings, hiding his face with his garment, as if to shield his eyes from the newly-created light which streams down from above. Here we see the Spirit of God depicted as a winged man or an angel, draped, but without any special attribute of divinity.

There is an extremely interesting series of the subjects representing the Days of Creation, in one of the cupolas in the entrance vestibule of the Cathedral of St. Mark, at Venice. The series of mosaic pictures is arranged in two zones in the cupola, the subjects commencing in the first zone with that representing the Spirit of God moving upon the face of the waters. Here we find the Divine Dove, invested with the nimbus, hovering over an undefined space of dark wavy lines.

The examples we have illustrated and commented upon present the three leading treatments of this subject, the Spirit of God being symbolised by the Divine Dove, and represented in one example in the form of a newly-born infant, nimbed, and floating on the waters; and in another example as an angel, winged, without a nimbus, and cover-

ing his face with his garment. Water is in every case represented; but it is only in the Monreale mosaic that we see a very marked attempt to express, in a conventional and symbolic manner, the "darkness" that "was upon the face of the deep." It is true, however, that in the St. Mark mosaic the waters are represented as if under a dark cloud or fog.

SECOND SUBJECT.

Text.—"And God said, Let there be light, and there was light. And God saw the light, that it was good: and God divided the light from the darkness. And God called the light Day, and the darkness he called Night. And the evening and the morning were the first day."

In treating the subject of the First Day, artists have had a two-fold call upon their powers—namely, in the delineation or the symbolic representation of the creation of light and the subsequent division of the light from the darkness. It appears, however, to have been purely a matter of individual taste which of the two events were to be most prominently expressed by their art, or which one was to be treated to the exclusion of the other. It may be pointed out that it was possible, and, indeed, a simple task for these Mediæval artists to

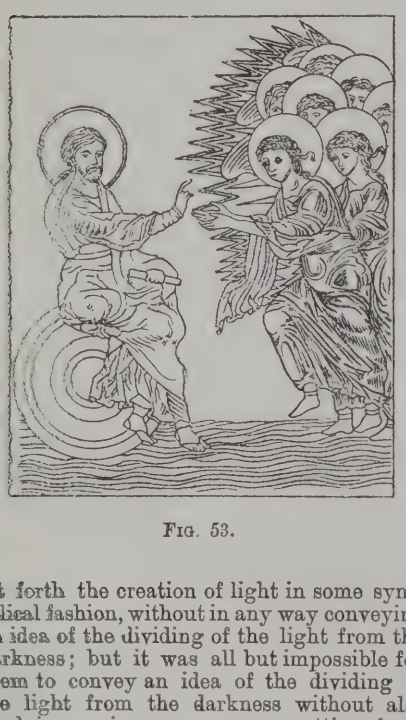

Fig. 53.

set forth the creation of light in some symbolical fashion, without in any way conveying an idea of the dividing of the light from the darkness; but it was all but impossible for them to convey an idea of the dividing of the light from the darkness without also implying or in some manner setting forth the preceding creation of light. This is, of course, obvious. In the subject in the series at Monreale we find an illustration of the former, whilst in that in the series in St. Mark's vestibule, we see an illustration of the latter treatment.

Turning now to the Creation of Light in the Monreale series, an outline sketch of which is given in Fig. 53, we see the Creator, in the form already described, seated upon what may be taken as a zoned globe or disc. This peculiar object, which appears as the seat of the Creator throughout the seven subjects of the series, is evidently intended to symbolise heaven, which is the throne of God. The blue tints which appear in the zones or rings support this symbolism. The Creator holds in His left-hand a closed scroll, whilst His right-hand is stretched forth in the act of creating light. The light called into existence is indicated by the numerous pointed rays which dart towards Him in advance of a group of angels. It would appear from this treatment that the artist held the theory, also held by St. Augustine and others, that the angels were called into existence on the First Day, when God said "Let there be light." We must either accept this reading, or look upon the angelic forms as impersonations of light and vivid brightness. At the time light was created there was no dry land, so the artist has placed the waters as the footstool of God. Perhaps he had the Psalmist's words in his mind, "The Lord sitteth upon the flood; yea, the Lord sitteth King for ever" (Ps. xxix. 10). This subject is treated in a most direct and simple manner; and, as we have said, illustrates the creation of light without touching in the slightest degree on the subsequent event, its division from the darkness. Here there are light and beings of light, without a shadow or indication of darkness. If we turn to the First Day, as presented in the Cathedral of St. Mark, we observe a widely different artistic treatment, in which the division of the light from the darkness is the leading motive. Here the Creator, youthful, beardless, with long hair, invested with the tri-radiated nimbus, fully draped, and carrying in His left hand a cross-topped wand or sceptre, stands with right hand stretched out. In front of Him is a red globe with lighter-coloured zones upon it, and from the edge of the first zone dart six rays of bright light, directed downward, and spreading slightly. Beyond this red orb is another smaller black orb, also zoned, and having six rays of dull light issuing from the edge of the first zone. Behind the red globe stands an angel, with outstretched arms and wings, and gazing downwards, as if in surprise, at the bright light. The body, head, right arm, and right wing are in a light colour; whilst the left arm and wing, which stretch towards the black globe, are represented in a darker tint. As we have observed, the leading idea on the part of the artist is the division of the light from the darkness; but at the same time he had to introduce the newly-created light. The two globes are evidently intended to symbolise the Day and the Night. The division of the light from the darkness is expressed by a light and a dark globe or disc in the miniature of the 14th century already alluded to, in which the Spirit of God is represented as a newly-born infant floating on the waters. In Cædmon's "Metrical Paraphrase" there is a subject in which, if it were not for the accompanying inscription—"How He divided day from night"—one would certainly fail to understand the limner's intention. The subject is contained in two overlapping discs. In the upper stands the Creator; and in the lower are drawn a number of plant-like forms, as if growing from the ground; above which, as if in the sky, are numerous stars. On the First Day neither the heavenly bodies nor plants were created, but these facts the Saxon limner seems to have overlooked. It is much more probable, notwithstanding the inscription in Anglo-Saxon characters, that the subject was intended for the events of the Third and Fourth days. Such a reading is supported by the contents of the third disc, placed above the two we have mentioned, which present a bird and a stag, evidently intended to set forth the creation of birds and beasts, which took place on the Fifth and Sixth Days.

It is quite clear that the Mediæval artists found all their powers insufficient to express, in any but a purely symbolical method, such a marvellous event as the creation of light. They did their best, however, and we cannot deny their ingenuity and bravery in attempting to do what they have done in this direction. If we turn to the works of the greatest of painters, we find in his "Creation of Light," in the Vatican Loggie, an attempt not a whit more successful than that of the humbler artist of the Monreale subject. Raphael represents the Creator, in the form of a brawny old man, draped, but with bare feet, rushing, with exaggerated action, through clouds of smoke, amidst which are vivid flames. Lady Eastlake, speaking of this painting, correctly remarks: "Here Almighty is seen rending like a thunder the thick shroud of fiery clouds, letting that light under which His works wer spring into life. Not that this re approaches a whit the nearer the reve fact. To the unassisted reading of the ey tells no especial tale; it may just as wel interpreted as the Almighty amid clo and fire and thick darkness on the to Sinai, or as an episode in the Battle of Giants." The concluding remark is guar teed by the fact that the figure of Almighty has absolutely no attribute divinity—nothing in the shape of a nim is introduced.

(*To be continued.*)

A NEW PROCESS FOR HARDENING A PRESERVING BUILDING STONES

After the many attempts and failure find some method that will arrest the integrating agencies which affect our buil stones, it is satisfactory to know that a servative solution of a kind that can be re applied to stone blocks on a large scale has found, which, from the experience gaine ten years' use in France, Switzerland, Italy, other Continental countries, promises to eff remedy at once preventative and preserva Many of our scientific readers are acquai with the methods and processes that have suggested and applied, with more or less suc some of them like paints or varnishes, o that act mechanically or like silica, a third kind of processes which operate mechanically and chemically, like app tions of alkaline silicates. The objection the first named are that a paint or ping has the disadvantage of discolou the stone, imprisoning the moisture, causing disintegration by the action of and requiring repeated applications. The se class of remedies, while they fill the pores an indestructible substance, do not preserv intervening walls, and with regard to the class, the stone salts are soluble and absorpti moisture, and, besides, cause a white ef escence which disfigures the stonew Unfortunately, these processes deposit in pores of the stone a substance which, in of preventing decomposition, serves to mote it, as in the case of "li glass" processes introduced by M. Fachs M. Kuhlmann. The silica introduced bec hardened; but the agent employed to decon it—a salt of potash—effects the nitrificatio the stone. A further drawback to some of methods is that they require to be applied i laboratory of the chemist: the stone, in fact to be placed in vacuum chambers or immerse that the solutions may effectually enter the p therefore they are expensive, and often im ticable to adopt in the case of a large buildi

The proposed remedy is one which cert has the merit of obviating these disadvant The Bath Stone Firms, Ltd., of Bath, acquired the sole right to use and sell method, which is called "Fluate," an abb ated term to denote the process known as silicatisation. Four conditions are laid do essential to practical success in adopting method to increase the resistance of b ing stones to atmospheric action; these stated as follows:—"1. The process shou largely chemical. 2. Whatever change is eff in the stone, the resultant products sh be themselves insoluble. 3. The process sh not alter the natural appearance of the stone Its cost should be moderate." The Bath Firms (Limited) accept two other condi mentioned in Messrs. Rivington's volum "Materials" in "Building Construction," work is referred to in the treatise on "Flu These are that any preservative solution to practical value must be (1) "economi applicable on a large scale," and (2) "ca of application to the surface to be tected by means of a brush." After se years of investigation and experiment, the cess we have briefly described, discovered b eminent French chemist M. Kessler, of mont-Ferrand, has proved itself to comply the conditions. The "Fluate" process no fulfils these requirements, but is said "to solved the problem of the permanent preserv

n decay of certain of our building stones and er materials." Its value as a protection Bath stone has been fully tested by ıal exposure to the atmosphere. The ıltant products are insoluble. The Bath ne Firms thus describe the process:— 'here exists in nature a mineral whose pro- ty it is to remain unaltered when exposed to ıospheric influences. It is harder than marble, as transparent as glass. Employing methods wn only to himself, M. Kessler procures by ns of this mineral an agent with which he olves silica. The silica being thus rendered id, is in that state readily absorbed by the ıe. By readding lime to M. Kessler's new luct the original mineral is reformed, and at the e time the silica is again liberated in a solid e. The lime necessary to bring about these tions must be furnished by the stone itself, as the degree of efficacy secured by the pro- depends upon the proportion of lime em- ed, the proportion of lime contained in any n stone is an important factor. Bath stone ıishes conditions that are practically perfect; ards of 95 per cent. of it is carbonate of , and, therefore, what is virtually the entire s of the stone is, so far as it is impregnated the solution, transmuted into a substance ch is practically imperishable. No sooner the liquid Fluate enter into the stone ı it solidifies, and instead of the one mineral onate of lime, we get two other minerals, of which are insoluble, and unaffected by ospheric influences." To render the Fluate e penetrating, certain oxides are used, and e become insoluble. These insoluble sub- ces are unaffected by acids, the process ents vegetation, the stone retains its natural arance, and is not rendered glossy; the cost is said to be moderate, no skilled labour is ssary. One pound weight of crystals is cient to treat, with the required two sings, at least 40 superficial feet of ework. The price is 3s. 4d. per lb., l to 1d. per superficial foot of stonework. he Fluate can be applied from a ladder, like ewash, no scaffolding is required, and two s are sufficient. The pores of the Bath stone ıot sealed up so entirely as to prevent the ture in the stone evaporating—a most im- ant condition of the Fluate process; and it ated that delicate experiments have proved, r degrees from 50° to 380° Fahr., that the nsion and contraction of the fluated and ated stone are practically the same. Moist from 50° to 212° produced the same lt, so that no injury can arise from un- l expansion. The capillarity tests also that fluating reduces the absorption by lary attraction of the open-grained stones ne-half, and of close-grained stones by two- ls. The Fluate also hardens weatherings, floors and treads, rendering them more ting to wear.

he process has been applied to several im- nt French buildings, including the Louvre, Arc du Triomphe, New Opera House, the onne, the Ministry of Justice, Hotel de , Trocadero Palace, &c., &c., and the rials used in the process have be- ordinary articles of commerce. That French Government should have adopted process is a guarantee of the value he system, as the stones used in Paris largely composed of carbonate of lime, are easily worked. Full directions for using te on Bath stone are given in the appendix. understand that the process enables any ur to be imparted to the stone that be desired. We have no space to further into the question, but with hardening and preserving process, we hope again to see Bath stone in nany varieties becoming largely used in rn buildings. We can recommend to the us attention of the profession the little book Fluate," issued by the Bath Stone Firms, as which will repay perusal. The letters from ch architects and others who have had rience of the process are instructive and incing evidence.

WATERWORKS MEMORANDA.

HERE are two or three things, said Mr. Spencer Harty, the Dublin City Engineer, paper read before the Dublin meeting of Incorporated Association of Municipal and ary Engineers, which I have personally learned during the construction of the works, the calling of attention to which may be of use to some engineers engaged in either designing or maintaining waterworks, but especially to the junior members of the profession. The remarks may be commonplace, but very often common-place things, though most useful, are those least regarded.

Never have a vertical joint in puddle; in order to be of any service it must always have a seating; we had a serious and most expensive leakage arising from the neglect of this most simple precaution on a portion of our works, although we had most eminent men as consulting engineers. At stated intervals clean your filters down to the bottom, sides and all, including either rubble drain or perforated pipes—especially if the water is at all peaty. Filters should be made at the service reservoirs, and water after filtration never allowed to see the light until it is delivered in the houses. In carrying pipes through banks, make sure that they are carried entirely under the seat of the bank, and are arched over either in a culvert or otherwise, as they are then relieved from the pressure of the subsiding bank on top, and so free from danger, and can also be got at for repairs if necessary.

Never allow a portion of a pipe to rest on rock or masonry whilst another portion is on clay, as if so it is sure to be broken across.

All air-valves on large mains ought to have screw-valves fixed between them and the mains, as I have seen many cases of charging mains, where from either the air-ball sticking in the bottom or from some other cause it did not act, and consequently water had to be again shut off, until the ball was set right; also if main is working and repairs required to air-valve, the water must be shut off a long section of main—always a dangerous and troublesome operation, both as regards shutting off water from mains under heavy pressure and recharging—whereas if there was a screw-valve between the main and air-valve there need be no trouble. A long length of main with but little rise or fall eminently requires the precaution of air-valves, as air lodges in such.

I have also noticed a curious fact. During a severe winter some years ago, and whilst there was a heavy fall of snow, I found that where our mains crossed outside the canal bridge at Leeson-street and were fully exposed without any protection, that the snow did not remain on them. I took up a handful of it and threw it on the pipes, but it immediately melted, showing that the friction of the water caused a certain amount of heat in the pipes.

CHIPS.

In the grounds of Whiteshill Vicarage, near Stroud, have been found fragments of Roman pottery, calcined bones, and large-headed nails characteristic of the vicinity of a Roman villa. Like the Woodchester pavement, the first finds were but 2ft. below the surface, when a stratum of soft brick and cement, mixed with charcoal, was reached. The coins found are in excellent preservation.

On Saturday the members of the Dundee Institute of Architects visited Stirling, and examined the East and West Churches and the Castle, afterwards dining in the Golden Lion Hotel.

New Church schools have just been completed for St. Mary's parish, Truro. Mr. Swift, of that city, was the architect.

The parish church of St. Andrew, Stanton-on-Hine Heath, is about to be restored at a cost of £800, from plans prepared by Mr. A. B. Deakin, of Shrewsbury.

The new theatre erected at Cheltenham will be opened on Thursday next, Oct. 1. The plans were prepared by Mr. F. Matcham, of London, the contractors being Messrs. Bradney and Co., of Wolverhampton. The façade is of red brick, relieved by stone pediments and sills. The decoration of the auditorium is in Louis XV. style, with a slight intermixture of the Italian. The proscenium is 24ft. wide in the clear, and 34ft. high in the centre. The stage has a width of 48ft. and a depth of 45ft. to the curtain line. The theatre is seated for 1,500 people.

The death took place on Saturday of Mr. Robert Austin, for many years secretary of the Amalgamated Society of Engineers. For the appointment, which is worth £300 a year, and is virtually held for life, although there is a formal election annually, there are three candidates: Mr. Eversleigh, of London, Mr. J. Ferguson, of Glasgow, and Mr. Whittaker, of Manchester.

COMPETITIONS.

Cork Courthouse.—The thirteen sets of competing plans for the restoration of the county and city courthouse and offices have been opened, in the presence of the committee of the corporation and the county courthouse commissioners, with Mr. Thomas Drew, R.H.A., president of the Royal Institute of the Architects of Ireland, who has been appointed assessor of the committee. The assessor will, in the first instance, advise the committee as to whether they are in accordance with the conditions laid down and communicated to the competitors, and secondly as to which of them, in his opinion, are best entitled to the three premiums of £100, £60, and £40 respectively. Each set consists of a series of nine drawings, viz.:—A plan of the basement, showing the cells for prisoners, and the method of heating the building; a plan of the principal floor, showing the arrangement of offices and seats in court; a plan of the first floor and offices, four elevations, a cross section, and a longitudinal section. All these are on a scale of 8ft. to 1in., and each set is distinguished by a motto. The conditions have fixed the cost of the work at a maximum, £20,000; but the committee have intimated that they expected it to be done within £15,000. With reference to the front elevation of the building, it has been laid down that the present portico and façade are to be preserved. The other elevations are subject to such alterations as may be found necessary to meet the altered arrangement of the interior.

"Owen Jones" Prizes.—This competition was instituted in 1878, by the Council of the Society of Arts, as trustees of £400, presented to them by the Owen Jones Memorial Committee, upon condition of their expending the interest thereof in prizes to "Students of the School of Art who, in annual competition, produce the best design for Household Furniture, Carpets, Wallpapers and Hangings, Damask, Chintzes, &c., regulated by the principles laid down by Owen Jones." The prizes are awarded on the results of the annual competition of the Science and Art Department. Six prizes were offered for competition in the present year, each prize consisting of a bound copy of Owen Jones's "Principles of Design," and a bronze medal. The following is a list of the successful candidates, with the names of the schools of art of which they are students:—Gertrude Roots, Canterbury: Design for a mosaic pavement, and design for a plate. Edith Gillman, Canterbury: Design for a damask table-cloth. Evelyn D. Foster, Hertford: Design for a mosaic floor decoration. Annie Barnett, Cavendish-street, Manchester: Design for a majolica plate. Arthur Beardsley, Nottingham: Design for an Axminster carpet. William Rawlinson, Burnley: Design for a printed cotton hanging.

Somerset New County Asylum. — The county council having purchased a site near Taunton, and determined to erect a new lunatic asylum for 750 patients, invited several architects well known for this kind of work, to compete. The plans were sent in under motto, Mr. C. H. Howell, architect to the Lunacy Commissioners, acting as assessor. Messrs. Giles, Gough, and Trollope, of 28, Craven-street, London, have been selected to carry out the work, Mr. G. T. Hine, of Nottingham, being awarded second place, and Mr. Jacobs, of Hull, third place.

At Exeter City Council on Friday, a letter was read from the clerk to the Devon County Council stating that the sewage of the city was at present discharged into the River Exe, contrary to the provisions of the Rivers Pollution Act, and asking what steps the council were prepared to take to insure those provisions being complied with. After much discussion it was decided that the matter should be referred to the whole council in committee.

A new chapel for the Wesleyan New Connexion at Aldford, Cheshire, was opened last week. It has been built at the cost of the Duke of Westminster, and is Early English in style, having red Ruabon brick facings and terracotta window dressings. The steep pitched roof is covered with small slates, and has a spirelet for ventilation covered with oak shingles. The interior has buff brick lining to the walls, with patterns in pink bricks and open-timbered roof of pitch-pine, and cathedral tinted glass in the windows. There are 140 sittings. The fittings and also the benches are of pitch-pine. Mr. W. W. Freeman, Chester, is the builder, and Messrs. Douglas and Fordham are the architects.

DETAIL OF DESIGN SUBMITTED FOR THE NEW SOUTH KENSINGTON MUSEUM BUILDINGS, BY MR. J. BELCHER.—DESIGN SUBMITTED FOR THE NEW BURY MUNICIPAL BUILDINGS, BY MR. H. HOPTON.—VIEW INSIDE THE TEMPLE CHURCH, NORTHAMPTON.—"THE DESCENT FROM THE CROSS," IN MAYNOOTH CHAPEL.—A BUNGALOW AT NINE-MILE RIDE, BERKS.—BANGLEY FARM, STAFFORDSHIRE.—SELECTED DESIGN FOR NEW PUBLIC LIBRARY, STOKE NEWINGTON.

Our Illustrations.

SOUTH KENSINGTON MUSEUM COMPETITION.

We published Mr. Belcher's design in this competition on Aug. 21 last, when we reproduced his plans for this work. Herewith we print a photo-lithograph of the large detail in further illustration of his principal façade. A reference to the view is necessary to show how the parts come together in the general composition, as the dome sets back considerably from the arcaded part of the building below. The dignified and picturesque introduction of the sculptures between the pilasters affords scope for fine figure-work, and the red-brick walling would give colour effectively. The elongated proportions of the columns in this design is only one of the many departures from the rules regulating the order of orthodox Classic architecture which it intentionally ignores.

BURY MUNICIPAL BUILDINGS.

Last week we illustrated the first and second premiated design in this recent competition, and to-day we print a view of plans of another of the designs submitted. The author is Mr. Henry Hopton, who chose the widest street, known as Haymarket-street, for the main frontage of his building. In this respect his plan differs from the selected designs. The council block is in Haymarket-street, the office block faces Market-street, and the police block is entered from Moss-lane. The plans show how these arrangements have been carried out. The principal entrance in Haymarket-street leads into a large hall and staircase, lighted by windows and a domed lantern over. The reception-rooms are on the first floor, with the council chamber and committee-rooms. The town clerk and surveyor are located on the second floor, with laboratory for the health department in the roof. The caretaker is located on the second floor. The building has been set back from the frontage line, in order to obtain external areas for lighting the basement, and keeping the rooms thoroughly dry. The façades of the building are intended to be faced with Ringley stone, the internal walls to be of brick, and the areas lined with white glazed brick. The roofs are proposed to be covered with green slates. Fireproof floors are intended for all corridors, and mosaic pavements for the chief parts. The principal staircase is designed to be carried out in marble. The cubical contents of the building are 1,594,078ft., which, calculated at 9d. per foot cube, brings out the cost to £59,778.

VIEW INSIDE THE TEMPLE CHURCH, NORTHAMPTON.

I think colour the only medium that could do full justice to this subject. The rich Siena browns of the massive stone pillars set in a background of the sombre greens and greys which pervade the outer walls, the stream of sunshine tempered into rainbow tints as it comes through the coloured glass, all tend to the warm effect with which the whole seems pervaded, and that might well have formed the subject of envy to some of our more ambitious brothers of the brush—all the old and gloomy memories of darker ages melting into dreamland before the brighter-light and broader charity, let us hope, of its latter day observances. "Britton," I see, doesn't seem disposed to commit himself to anything very definite touching the building of this edifice, merely stating "that as the circular part of this church was built by the Templars, I am induced to suppose that it was erected towards the end of the 12th or beginning of the 13th century, just when the pointed-arch style began to prevail." Hence, therefore, we may possibly account for the strictly Norman detail with the pointed form, a feature which he subsequently refers to when he speaks of the church as being "constructed without any regard to decoration or beauty, yet possessing many peculiarities which distinguish it from the other circular churches, and render it a unique example of ancient architecture." J. Donkin.

"THE DESCENT FROM THE CROSS."

Maynooth College is the principal seminary of the Roman Catholic priesthood in Ireland. It is an institution of considerable magnitude, and has occupied the attention of many architects in the various buildings connected with it. Mr. Pugin, we believe, was the architect who first did Gothic work here, and that style has predominated with the architects who have succeeded him since his decease. The present work is being carried out under the supervision of Mr. W. Hague, 50, Dawson-street, Dublin, whose drawing gained the competition for the decorative work and furniture of the chapel connected with the college, and was given in our issue of Jan. 20, 1888. Our present illustration is from one of the considerable number of paintings from the studio of Mr. N. H. J. Westlake, F.S.A., which adorn the chapel of the college. There are also some few other paintings in this chapel, which are not in our list, as Mr. Westlake is not responsible for them. The whole roof, both of chancel and nave, with its ornamentation and figures, is designed by him, and the ninety life-sized three-quarter figures from his studio illustrate the principal early saints—such as the Blessed Virgin, St. John the Baptist, the Four Evangelists, &c.—with the archangels and angels carrying emblems and instruments of the Passion, at the eastern end, and the principal Irish saints and missionaries at the western end. Each figure is surrounded by a scroll and some foliage; on each scroll is written a versicle of the "Te Deum" or some other hymn. It is one of the largest and most complete painted Gothic roofs in the world, and the effect is extremely grand. In the nave Mr. Westlake is at present engaged on the Stations of the Cross or *Via Crucis*. Each Station picture, with its border, occupies a space of 12ft. by 8ft., the figures being a little below life-size. It is one of the largest existing set of Stations, each design being original.* The illustration we give is of the thirteenth station, "Our Lord taken from the Cross." When complete, there will be fourteen pictures of the Stations, which is the usual number now in use. At Coire, we believe, there are fifteen, but it is unusual. The *fourteen* stations are not, as a devotion, of very great antiquity in Western Europe. Four pictures are *in situ*, and four more are in progress. *The ornamental portion* of the roof was carried out from Mr. Westlake's design, by Mannix. The west window, representing a Majesty with adoring Saints, is by Messrs. Lavers and Westlake.

A BUNGALOW, NINE-MILE RIDE, BERKS.

This house, of which an elevation, two key plans, and a bird's-eye sketch are given among our lithographic plates to-day, has been erected on a fine site in this well-wooded part of county of Berks in the neighbourhood of ington College. The interior courtyard fo feature in the plan, with the reception- grouped round it. The contractor was Mr. Humphreys, of Knightsbridge. The roo covered with thatch, and the walls abov brick plinth are finished in plasterwork, timberings to the upper part. The constr of the bungalow is entirely of timber, wit sheetings inside the plastering, where ther air cavity and felt beyond. In execution minor modifications were effected in the of the work. A feature is made of the sta with its arcaded gallery above.

BANGLEY FARM, STAFFORDSHIRE.

This house has recently been rebuilt fo A. B. Foster, of Canwell Hall, Tamwo his Staffordshire estate, from the plan under the superintendence of Mr. T. V Newton, architect and surveyor, of 121, Co row, Birmingham. The old farm building in good condition, having been recently by Mr. Foster's own men, and are exce arranged for the accommodation of hors cattle. The house was very dilapidated, a been replaced by the one herewith illus The walls are built of red bricks, and ar thick, with a cavity in the middle jointe glazed earthenware ties. All the timbe solid stuff, and 8in. thick with hollow an wall on inside of same. The roof is covere local tiles. Mr. Trentham was the builde

PROPOSED PUBLIC LIBRARY FOR STOKE NEWI

Nine sets of designs were received library commissioners in response to invitation. The plans submitted by Bridgman and Goss were selected. The modation asked for was a lending libra contain about 1,200ft.; a reference libra contain about 750ft.; a news and magazine to contain about 1,600ft.; a book store, t tain about 400ft.; and a librarian's of contain about 250ft. The librarian's apar required were a sitting-room, three bed and the usual offices. In the successfu the whole of the public accommodation for is provided on the ground floor. The di apartments are divided by glazed partitio have each their own entrance. The posit the librarian's office gives him complete over the whole. The ground floor is 14ft and the news and magazine room, the re library, and the librarian's office are top- along the whole length. The elevations of red brick and Monk's Park stone, a roof of strawberry-coloured tiles. The is necessarily very plain, as the limit of £2,500.

CHIPS.

A new cemetery is being laid out at the St. Clement's Hill, Truro. The buildings, in chapel, mortuary, catacombs, and lodge, ar rated Gothic in style, and are being erect designs by Mr. Clemens, city surveyor.

The first sod of the reservoir at Burntw the proposed waterworks to supply Market D was cut by the chairman of the waterwor pany on Monday week. Mr. Myatt is the e and Mr. Dale, of Northwich, the contractor

Mr. Jos. Blackburn, of Nottingham, h awarded the contract for the whole of the li conductors for the New Municipal Building bay, India, and the same are now being made by him, and will be fixed on his pate tered system.

The reconstruction of the tower of Barmo church which fell on Sunday week, crushin nave, has already been commenced un direction of Messrs. Douglas and Fordh Chester, the architects of the church. Mr. W of Wigan, is the contractor.

The new main drainage and precipitatio constructed for the Richmond main sewera at Mortlake, will be inaugurated by the Pres the Local Government Board on Monday ne

On Thursday, the 17th inst., the town sioners of Dundalk proceeded to inspect waterworks, and to hold a "house-warmi the new caretaker's house and board-roon reservoir. The water is impounded fr streams at Ballymakallet, and is carried iron pipes to Agnaskeagh, where a reservo acres in area has been formed, supplying reservoir at Fanghart, a mile off, from w water gravitates to Dundalk. Mr. Gaski engineer.

* We say *original*, for in walking through the various churches of this country and Ireland it is unusual to find an original set of stations, and the opportunity of patronising and encouraging religious art is utterly thrown away. Even in the principal London churches one often finds copies (either painted or cast) made in some German or French shops by copyists, who apparently use the set of engravings published some years since from paintings by Fuhrich for their purpose. Of course, they are only piracies, for Fuhrich would have been a wealthy man if he could have had a *royalty*, to which he was justly entitled. These works have usually such a quality as a copy from an engraving may be expected to have.

BANGLEY FARM, STAFFORDSHIRE.

WAYSIDE NOTES.

WHEN in the City one evening a few days ago, I marvelled to see the waste of good uminating gas evidenced in the thoroughfares ere the new system of electric lighting has en installed. In Queen Victoria-street, for ample, the electric lights were answering mirably, yet the hundred and one gas-lamps re also burning merrily. This seems a sad ste, unbecoming to municipal economics, and lecting somewhat on the character of electricity an illuminating agent. An explanation was hand, however. At the first meeting of the mmissioners of Sewers, Mr. Ross, the assistant gineer to the commissioners, said that the ason why the lighing of gas had been continued streets where the electric light had been tablished was that certain risks and responsi- lities had not been taken over by the Electric ghting Companies until a day or two since; t now in the streets in question gas would no nger be used. This is a satisfactory announce- ent, seeing that the evenings rapidly lengthen, d the day of much artificial lighting ap- oaches, when gas-burning as an auxiliary to e electric light would become a serious expense City ratepayers. By this time the want of nfidence in the constancy of the electric light s surely disappeared, however wise may have en the caution exhibited in the bygone days of e flickerings and many-coloured flashings of e early, imperfect lamps.

There is some little of interest in the report of uesday's meeting of the commissioners. Well- nkers will take note of the fact that an artesian ell at some artisans' dwellings in the Minories aving been bored to the contract depth of 352ft., ields from 17,000 to 19,000 gallons of water aily—an amount, however, insufficient for the quisite purpose, and consequently the Commis- oners have ordered a further depth of 100ft. in he chalk, at an additional expense of £150. his will be all very well if no other proprietors f deep artesian wells suffer detriment. Facts lating to neighbouring wells of this kind are rious. I always understood, for instance, that he two breweries on either side of the Thames etween London Bridge and Southwark Bridge arclay's and the City of London—on account of he comparatively close proximity of their deep ells, have to brew on alternate days. It is ust possible, if the Minories well is carried down o a considerably lower level than those of these reweries, that the latter supplies may be ffected, all of which points to the desirability of more voluminous, cheaper, and purer supply of ater from a distant source, so that it may be fficient for all ordinary uses, while artesian ells can be left to those who require them for pecial purposes.

Sanitary matters have not been neglected in he City during the recess of the Commissioners. Dr. Sedgwick Saunders, the medical officer, has ot rested on his oars, having visited, with the ntent of sanitary improvement where possible -973 houses in the City, and served 741 notices o cleanse and limewhite interiors in accordance ith regulations pertaining to lodging-houses. This is a pretty good sanitary crusade for a period f only nine weeks, and when we repeat that in he same time 91 tons of meat has been seized as nfit for human food at the various markets and laughterhouses, beside other good measures aken, we realise the benefit of modern sanitary egislation, and understand why everyone does ot nowadays go through the round of maladies -fevers, small-pox, and the like—supposed by he past generation to be inevitable travelling com- anions in life's journey from infancy to old age.

The demolition of houses in Leadenhall-street as, I understand, opened up some more or less picturesque views in and about St. Mary Axe. A whole side of the Church of St. Andrew-under-Shaft has been exposed to view, besides a buttress f the tower, heretofore, apparently, incorporated s structural support to the old buildings de- nolished. It is said that the site is to be mmediately built upon, so those fond of seeing old nooks and crannies of the old City revealed by improvements, both real and imaginary, should not fail to run round to St. Mary Axe. Procrastination in these matters, in an era of steam derricks and generally rapid building, means chances gone. To hear of such-and-such a building being exposed in an unusual manner owing to the pulling down of old tenements, and to put off visiting the site for only a few weeks means disappointment in very many cases, as we find, when we do at last make the pilgrimage, that new walls impede the view, or, at the best, we have to peer through the chinks of a "close-boarded hoarding" in a manner scarcely dignified enough for handmaidens of high architecture who never work for less than 5 per centum—except on convenient occasions.

What a wealth of possible new views of old faces is there in London! Only to think of the old City churches, hemmed in at present on all sides by tall buildings—offices, warehouses, or what-not—brings to one's mind the possibilities of the unknown and undreamed-of picturesque that exists in a large city. In a place like London there is quite a world of beauty of architecture never thought of, and lying undiscovered perhaps for all time. Now and then operations of rebuilding, necessitating pulling down old houses, reveals to the gaze of Mr. Eyes—as distinct from Mr. No-Eyes—not only novel combinations of this building and that, but views and prospects of the features of individual buildings, novel—in their effect—even to their very designer. Nor is it necessary that an ancient building be concerned. Often building operations will display new views of comparatively recent works, as, for example, when the improvements at the Holborn end of Gray's Inn-road revealed to the public gaze a new prospect of St. Alban's Church. The formation of new streets and thoroughfares is a fruitful source of this sort of revelation of the picturesque. Even in such cases, however, those who would discover novel views of old and new works of architecture must promptly repair to the scene of pulling down operations, as, in nine cases out of ten, the new views are but temporary, to last only so long as the newly-formed sites are unbuilt upon, which, in this city is generally a very short interval of time indeed.

Municipal lodging-houses are likely to be an increasing and developing institution, if those already planned and intended to be erected answer their expectations. Without waiting to see the success of the example to be built by the London County Council, the Newcastle Corporation have wisely decided to undertake the construction of a model lodging-house, which, besides being likely to prove, as I sincerely believe, a boon to poor humanity in that Northern town, bears some fruit for the architectural community, in that the plans are to be put out to competition. May the whole affair go through successfully and prove a working success, such as will lead to the erection of other municipal lodging-houses in every large town in the queendom. It is sufficient to pass by the doors of the lowest types of lodging-houses in London to feel the necessity for a development of the municipal lodging-house. To reflect that what we should refuse to enter for so much as five minutes is the only possible abode of thousands of men who, if they sigh for no better means of shelter, it must be because they are deadened to all feeling by long custom and usage, must surely be to sympathise with any movement calculated to make an improvement in this direction. Such improvement I do believe to be waiting the practical realisation of the schemes for model municipal lodging-houses already put forward; and if in very truth improvement does result, the system must rapidly develop, since in so many of our large towns there is the section of population living, or "existing" in the miserable accommodation afforded by private lodging-houses or "doss-houses," as the Salvationists have it, who, let it be frankly said, seem to have done something practical in their spick-and-span-looking "Ark" to help on the present question, as all may see for themselves who will walk along Southwark-street, past the premises aforesaid, and continuing into the wilds of the Boro' district, contrast therewith the nastiness of aspect of the average low lodging-house.

Your very interesting and instructive article on "Contrivance in Planning" will have been read with much profit to the reader. If I could add anything on the subject, it would be to point out two distinct types of plan—(1) where there are restrictions and exigencies; (2) where there is freedom more or less absolute. The former plan is unconsciously developed *from the boundaries inwards*; the latter may often be advantageously developed *from the interior towards the exterior*, piece by piece, as the bee—no mean architect, by the bye—constructs her ranges of wax cells. The trammelled plan will often require much wrestling with, the whole gradually assuming—after much laborious thought—definite shape from an original chaos. The free and unrestricted plan, such as pertains to symmetrical and monumental designs, may be worked out methodically if only the planner will commence with some definite base of operations, and move not from thence unless certain of his aim and of the rightfulness of his intentions. No better or simpler example of the latter class of planning can be instanced than that of a cruciform church, which every reasonable architect would commence by laying down axial lines for nave and transepts.

GOTH.

CHIPS.

The name of Frederick William Fryer, of Surrey-street, Strand, architect and surveyor and newspaper proprietor, appears in the list of receiving orders in bankruptcy in last Friday's *London Gazette*.

Pembroke Chapel, Liverpool, was reopened last week after alteration and renovation carried out from designs by Mr. Auger as honorary architect.

Memorial stones of a new Wesleyan Mission Chapel at Saville-green, York-road, Leeds, were laid on Saturday. Plans have been prepared by Mr. W. Baldwin, architect, Leeds, for a chapel, which will contain one large room, with two class-rooms adjoining. There will be accommodation for 270 scholars, and 200 persons can assemble for public worship. The cost of the land and the erection and furnishing the chapel will be £1,000.

The members of the Glasgow Architectural Association paid a visit on Saturday to Paisley, where they inspected the Abbey, the Coats Memorial Church, and other buildings of interest.

Mr. W. H. Radford, C.E., of Nottingham, has been instructed by the corporation of Durban, Natal, to draw out plans and specifiation for the supply of six miles of steel tram-rail, with all necessary fittings.

Mr. Hamo Thornycroft's statue of the late John Bright was successfully cast in bronze the other day by Moore, of Thames Ditton, and is ready for the unveiling, which takes place at Rochdale on the 24th of October. Mr. Bright is represented in the act of making a speech, the right hand being slightly raised, and the other, which grasps his notes, hanging at the side. The figure measures 9ft. 6in. in height, and will stand upon a granite pedestal not less than 11ft. high. It will be placed in front of the Town Hall.

The directors of the Harrogate Gas Company have appointed as their assistant engineer Mr. Bertie W. Richardson, who for the past five years has acted in the capacity of assistant to their late engineer, Mr. P. H. Wilkinson, Mem. Gas Institute. Mr. Richardson executed the whole of the plans, and is superintending the erection of huge buildings for the storage of gas-coal at the works. The directors last year adopted a scheme of Mr. Richardson's for the development of an estate which the Company have since placed on the market. It is situated near the gasworks, and the scheme embodies the erection of a number of artisans' dwellings.

On Saturday afternoon the president of the Bristol Master Builders' Association (Mr. E. T. Hatherly), Messrs. James, Scull, and Cowlin (members of the association), Mr. Henry J. Spear (secretary), and Mr. Perry (the instructor of the plumbing class) attended the School of the Society of Merchant Venturers for the purpose of adjudicating upon the work of the students during the past session. After carefully examining the specimens of plumbing work, the prizes for practical work executed at the school workshops were awarded to J. W. Holbrook and F. J. Cann. The adjudication of prizes in the carpentry and joinery classes was deferred.

A very large clock was formally started in the parish church of Kendal on the 11th inst. It is the gift of Mrs. Braithwaite, as a memorial to the late Mr. G. F. Braithwaite, of Hawesmead, Kendal, and is fitted with all the latest improvements. The quarters are chimed on four bells as at Westminster, and the hours are struck upon a 25cwt. bell. The escapement is a double three-legged gravity one, and the pendulum is compensated for changes in the weather. All the wheels have machine-cut teeth, so as to be perfectly accurate, and the whole of the parts are arranged so that any part may be removed without interfering with the others. The whole of the work has been carried out by Messrs. John Smith and Sons, Midland Clock Works, Derby.

HOT-WATER ENGINEERING.—XVI.

SUPPLY OF HOT WATER FOR BATHS AND DOMESTIC PURPOSES.

TWIN BOILERS.

IT occasionally happens that a range with two boilers to it is required, these boilers being situated side by side at the back of the fire, and usually being designated twin boilers. With the modern close-fire kitcheners, this is an unusual requirement, and one that cannot be recommended at the best of times; but with the old open ranges, it was the commonest thing imaginable, and fully half of these old ranges that are

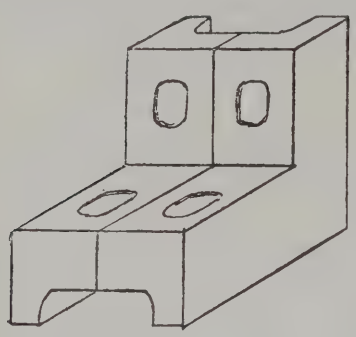

FIG.48

taken out have two wrought-iron boilers, if they have been used in good-sized houses. This brings us to consider a matter that is sometimes difficult to adjust, and which occurs with frequency in large West-end London property.

When a large open range is displaced, and it is found to have two boilers at the back of the fire, it will, in nearly every instance, be found that one boiler, which is devoted to supplying hot water to the kitchen offices is supplied with water from a cistern situated somewhere near on the same floor. The other boiler, which furnishes hot water for all upstairs requirements, by means of a circulating apparatus, is fed from a cistern situated up on the highest floor—probably on the roof. With the new range there will be probably only one boiler, which is fully capable of supplying all taps and doing the work satisfactorily that has hitherto been done by two boilers, and thus far all is well; but there now arises a question needing every consideration, and which may readily be overlooked.

When an open range has two boilers fed by two distinct cold-water cisterns, it will in most cases be found that the lower one, used for servants' offices, is the largest, and the one at the top of the house, for upstairs supply, smaller. Under the new arrangement with one boiler to supply all taps, the lower cistern has to be

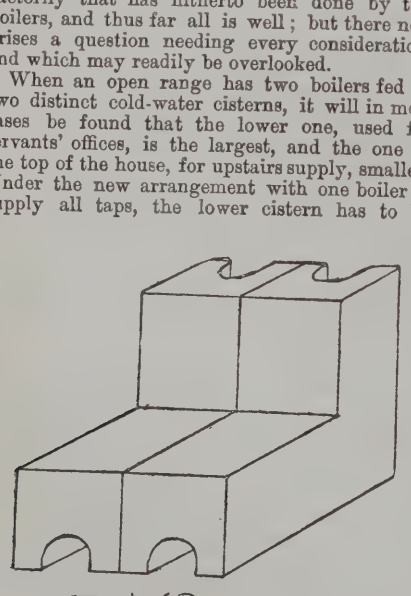

FIG.49

entirely disposed of—it cannot be used, and then the upstairs one will very likely be found of insufficient size for all purposes. This is where the trouble arises, and matters cannot be left in this state.

The remedy is to either increase the size of the cistern upstairs, or, what is better, place an auxiliary one beside it; if this cannot possibly be done, then the new range must have two boilers, worked in the same manner as in the old range. Every possible attempt should be made to avoid the two boilers, if possible, by increasing the water supply at top of house (it can sometimes be arranged for the constant supply service to be connected), for twin boilers have so many disadvantages.

Figs. 48 and 49 show the two forms in which these boilers are made, the difference being in the flues. These boilers are shown boot-shaped, but, of course, the saddle shape can be adopted if desired. The first figure shows what we might describe as an ordinary boot boiler, divided vertically down the middle, thus making it capable of being put to two different purposes, and fed from cisterns at different levels; the division could be made more to the right, or left, as desired, so as to make one boiler better suited for a larger demand for water than the other may have. This is one of the chief troubles of this arrangement, as, there being no means of controlling either boiler separately, it will always be found that one is overdoing its work, and the other more or less a failure. It is impossible to arrange these boilers so that each will exactly meet its own distinct requirements.

The second figure shows two distinct boilers, the counterpart of one another, but having flues of their own, which, by a proper arrangement of dampers, permits one to be urged or checked without noticeable interference with the other. This is the best arrangement, but it necessitates a very wide firebox and an unnecessary consumption of fuel; in fact, little could be done in this way with a fire less than 18in. wide; and even with this the two boilers would not be equal to a single wide one in a 14in. fire, so that a formidable obstacle to using two boilers exists here.

Sometimes the two boilers are required for distinctly different uses—viz., one for water supply and one for steam (for small cooking operations). Under this arrangement the results are most irregular, for we must not have a poor heating boiler for steaming purposes; yet this

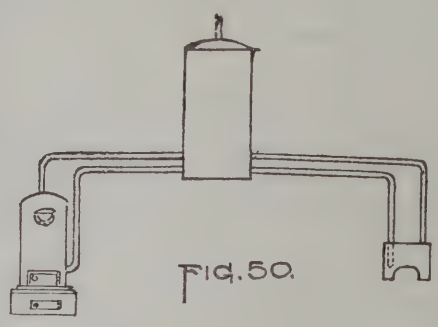

FIG.50.

boiler may only be in use a few hours per day, and the remainder of the day its efficiency goes for nothing. Under any circumstance, twin boilers are but a very limited success, and, added to this, they lead to an unnecessary consumption of fuel. If two boilers must be provided, let one be in the range, and one independent. The first cost will be but very little greater, but the ultimate cost in fuel will be decidedly less. In addition to this, efficiency will be insured, and no complaints will ensue. Complaints of some sort nearly always transpire when twin boilers are fitted up, for servants employed in the kitchen of a large residence have little time, and less patience, to humour a range that does not give good and regular results.

Closely connected with this subject is the practice of connecting two boilers to one apparatus, the boilers being either in close proximity to one another, or separated by being in two different rooms. This practice can be spoken of more favourably than the last, for it has many good features, and none that are actually objectionable. In the first place there is the occasion referred to in an earlier paper, in which it is supposed that the range boiler in a school or some such institution is not of sufficient power at certain times in the day, and is therefore assisted at such times, and generally, by an independent boiler connected to the same apparatus. This is a useful and oftentimes necessary resource, particularly when a large number of baths are required at morning or night, but the demand for hot water only normal during the rest of the day.

If the apparatus is upon the cylinder system and the conditions are favourable, it is best to keep the main flow and returns from each boiler distinct, running them each directly to the cylinder, as Fig. 50. There is not so very much to be said in favour of running distinct primary flows and returns in this way; but the are more inclined to efficiency than any method. If the cylinder was situated at t of the ranges, then the services from one would have to be branched into those other, probably as Fig. 51. With the system, the services would be branched in other, flow to flow, and return to retur the last illustration. There is no par point at which they have to be joine nearest or most convenient junction is effe

When a junction is effected betwee boilers that are situated in different rooms generally with the idea of one boiler aidi

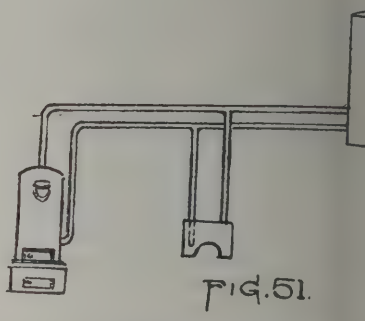

FIG.51.

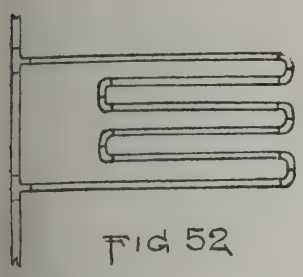
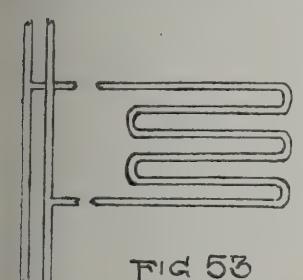
other; but sometimes it is that two ki exist, having a range and boiler in each. I case the two boilers are put in communi with the one apparatus, so that if one kitch is lighted and not the other, whichever it m the supply of hot water will not fail. It course, a common thing to have a second either in another kitchen or scullery, this acting as an auxiliary to the other, wh usually a larger one. It is a desirable pla a second range is of the utmost convenience the large range is out of repair, or at such that but little cooking is required. At all times the hot water does not fail, as each has its own boiler; and of course, if ranges were in use when cooking for a number, the only effect upon the supp hot water would be to make it more abu than ever. It will be understood that in co ing up two boilers to one apparatus it necessary for the boilers to be upon an exact with each other: they could be on two diff floors, if necessary; but if the apparatus w the cylinder system, both boilers would, of c have to be below the cylinder.

CONNECTING COILS, FOR HEATING PURPOSES, SUPPLY APPARATUS.



This is a practice frequently carried out, sometimes with excellent results, but a d care must be exercised in speaking favourab it, as ill results can be very easily attained. the first place, there is no doubt whatever the objects sought to be attained in a he apparatus and those of a domestic supply sy are distinctly opposed to one another, and ever way they may be worked together, must bring about some injurious results t other. The object of any heating applian coil is to diffuse, dissipate, or in some impart the heat of the water to the air and rounding objects. This is effected chiefl radiation from the heated surface of the p also in a great measure by the abstraction of by the air in contact, which distributes the by the process of convection. In other w this coil will effectually do what was so stro condemned in the last paper, viz., disperse heat so that it will not issue with the water the taps.

Of course, with an apparatus which has pipes and reservoir exposed, that is, not cov with felt or other materials as spoken of in the paper, we might liken the whole erectio a coil for heating purposes, as heat is diff from all these exposed surfaces from top to bottom of the apparatus. From this it wi seen that where heat is lost by radiation, &c boiler of more than sufficient power for the quantity of hot water used is required, and difference amounts, sometimes, to 50 per cent. arranging, therefore, for a coil to be use must be understood that the boiler must be that would be fully powerful for the o general work; otherwise some ill-effect, mor



ticeable, according to the size of the coil, experienced. This alludes to coils such ld be used for warming entrance-halls, and would be of fair size. A small coil of a n. pipes, such as is used for warming a upboard or closet, is nearly always admis- without consideration as to the power of ler. These latter heating appliances do rt with much heat after the closet in which re fixed is once warm

heating linen-closets, sometimes the tank l, and although the tank is thus put to a e that seems opposed to the conservation t, there is no particular objection. As just oned, a linen cupboard soon becomes very within, and although this warmth is ob- at the expense of the hot water, it is not wasted. The tank, after once warming its ndings, benefits by the heat that it has d—a very different thing to what is ex- ced when the tank is exposed, and all the adiated is dispersed.

itting up a coil in a linen closet, a few lines same pipe that is used for the rest of the tus is generally sufficient, either set (bent) le with short lengths of pipe and elbows,

. 52. This illustration shows the coil con- l wholly with the flow-pipe—a common ce, and not to be objected to, unless the as some distance from the main service when it would be better to connect it with pipes, as Fig. 53. Both these methods equally well to the larger coils referred to. ubject will be dealt with fully in a later

upon heating by hot water, and the more rn radiators will then be referred to, these es being preferable in every way to the ordi- pipe-coils for residence work.

casionally it is asked whether a short length pe, or a coil, in a greenhouse can be heated the kitchen range boiler, and such an gement can sometimes be met with. In case a considerable cooling influence is ex- nced; but there is another objection of a fatal nature in the fact that a greenhouse cularly wants heat at the cold hours of early ing, and this is when the kitchen fire is y, if ever, alight. A failure must ensue this cause, if it is the plant-life that needs armth. If it is only that the place requires ning during the day, that it may be com- ble to walk in and out of, then the night- can be put up with.

greenhouse is even more a tax upon the r than a coil in a hall or room, as the pipes aused to part with their heat very rapidly. range is 5ft. and has a boot-boiler which is capable for general domestic supply, 20ft. r.) of radiating surface might be permitted greenhouse, or 30ft. in the house. This is l to 20ft. and 30ft. of 4in. hot-water pipe; wherever possible, radiators should be used, nly on account of their appearance, but by n of their holding so little water. If we hed 30ft. of 4in. ordinary pipe to the appa- , it would be equal to another fair-sized voir, and so impose extra work upon the boiler in another way. A fair-sized radiator has from 25 to 30 superficial feet of radiating surface; therefore if two radiators are to be attached, they should be of small size.

ROAD MAINTENANCE.*

By R. H. Dorman, County Surveyor, Armagh, Ireland.

SINCE the commencement of the present century the general condition of the public roads throughout the United Kingdom has undergone vast improvement, and although the laws which regulate road maintenance and county work in Ireland differ from those in force in England and Scotland, and to some extent retard progress, yet I think I am correct in stating that the general condition of the country roads in Ireland is not very much behind similar roads in the sister island. Broken stone and gravel are the materials exclusively used for repairing country roads in Ireland; in some of the larger towns squared setts and cobble paving are a good deal used; but wood, asphalte, and similar materials have only been tried on a very limited scale. Since cobble pavements are universally condemned, I propose dealing in this paper only with macadam and stone-pitching in connection with road maintenance. The weather is an important factor in connection with road maintenance. We have too much sun in summer and too little in winter. In continuous dry weather the wind as a dust carrier creates a nuisance, while during and after rain it is beneficial. During long continued dry weather occurring at any period of the year, a high wind is most injurious to the roads; I have known roads break up just as badly in March as during any period in the summer, owing to the wind blowing all the fine particles off the surface and from between the broken stone. The effects of rain and frost are too well known to need discussion. I need only remark that whereas occasional rain is beneficial to a road, frost appears to be at all times injurious, and further that during alternations of rain and frost it is almost impossible to keep a badly bottomed road in order. No matter whether a road lies high or low, if it is overhung by trees it will be found to be constantly damp; this is most noticeable in summer, when the trees are covered with foliage. A neatly cut hedge, well set back from the travelling way of a road, is about the best form of fence that can be devised; but when overgrown they become not only an obstruction to the traffic, but they shut out the sun and wind from the road surface. Although provision is made by Act of Parliament whereby owners who refuse to lop their trees or cut their hedges, on being noticed can be compelled to do so, yet summoning such persons to Petty Sessions is one of those unpleasant tasks which a county surveyor is anxious if possible to avoid. The water level should be kept at least 2ft. below the road level; this is, however, not always possible. I have several roads under my charge which are constantly covered with water during flood time, and several roads in the neighbourhood of Lough Neagh are so covered for prolonged periods during the winter months. Keeping the outlets and side channels clear and the surface free from water is of nearly as much importance as the drainage of the subsoil. If, owing to inequalities on the surface, water is allowed to lie in the hollow parts, it gradually soaks into the body of the road, softening the binding material, and the stones having lost their natural cohesion, work on one another, and wear and tear goes on nearly as rapidly in the body of the road as on the surface; this action is, of course, greatest on a weak or badly bottomed road. To show the excessive wear and tear which goes on on a badly bottomed road as compared with a hard road, I may mention two short lengths of road under my charge. The first length of road is very badly bottomed, it is also too flat in section, and may be considered as a thin coating of hard whinstone resting on clay. The second length of road has a better bottoming, the top coating is considerably thicker and it is rounder in section. The traffic on each length amounts to about 1,200 cars per day, but the amount of material required to repair the first length of road is at the rate of 1,200 tons to the mile, while on the second length it only amounts to 800 tons to the mile per annum. Except in the neighbourhood of Belfast, steam rollers have not, I believe, yet been introduced on country roads in Ireland, and the road metal has to be consolidated by the traffic; the practice of picking up the surface before spreading on new material is also little attempted. For my own part, I do not consider it advisable to hack up a road, except when repairs are absolutely necessary in the spring and summer months, and then only when laying material on a hard road. If the bulk of the stone necessary for the repair of a road be laid on in damp weather during the months of October and November, it will take but a short time to work in; the stone should be spread off in sheets on alternate sides of the road, on hard roads the sheets should be kept thicker than on soft roads, and on hills the sheets should extend from the channels to rather beyond the centre of the road, the top corner next channel being cut off to allow the surface water an easy flow to channel; petty repairs should be effected by lightly picking in the wheel tracks as they form, and spreading off small patches as required. I do not consider it necessary to add any binding material when roads are repaired in the above manner; but I direct the surfacemen to sweep any mud or dust which may accumulate round a sheet on to it; this facilitates the binding, and helps to keep the sheet together. In summer, however, I sometimes find it desirable to spread off some blinding on roads repaired with whinstone and similar material to prevent the stones from rolling. Well drained, but badly bottomed roads, break up far sooner than any other class. For repairing main roads and streets of towns in Ireland I consider it high time to introduce a steam roller, and I do not despair of seeing the day when rollers will be considered a necessity for all road repairs. I find an Aveling and Porter 10-ton roller can consolidate from 800 to 1,000 square yards of roadway in a day of 10 hours, much depending on the quality and quantity of the binding material used. I estimate four rollers would be required in the County Armagh to deal with the main roads, at a cost of about £2,000 per annum. I should be glad to hear if any members of the association have had experience of rolling-in very soft material, such as white limestone. I fancy a six-ton roller would be as much as such material could bear. I believe the best method is to employ a foreman with a gang of men under him to attend to the roads in separate districts. In Ireland, however, it is the custom to employ one or more men to attend to each main road contract; it is not usual to employ regular surface-men for the by-roads. If hardworking and intelligent men could always be obtained for this purpose, there would be little objection to it; but unless carefully supervised, the men are apt to become careless, and frequently absent themselves from their work. In the County Armagh the amount of surface-work required in winter varies from one man to one-third of a mile to one man to five miles of main road. If I could induce the contractors to purchase horse-brooms and slop-carts, the manual labour would be much reduced, but so far only hand-scrapers and hand-scraping machines are in use to remove mud; these are also used to remove dust in summer on the limestone roads. More than one-half the roads in Ireland are repaired with limestone or limestone gravel, and for light traffic the blue limestone or limestone gravel makes an excellent road. The white or grey limestone is very inferior, and wears rapidly. In the County Armagh the materials available vary very much in quality; over a large portion of the Baronies of O'Neilland West, Armagh, and Turany, the white limestone only is available, and the amount of stone necessary to maintain the roads, and the amount of mud created, and consequent surface-work, is enormous. In the east and south of the county, whinstone, slate stones, granite, and elvanite are available; the whinstone makes excellent metal, the slate stones vary in quality, the granite is generally coarse grained and unsuitable for heavy traffic, the elvanite is superior to granite. Great difficulty has been experienced during recent years in co. Armagh in obtaining hand-broken stone in sufficient quantity. The amount of stone required annually for road repairs amounts to about 80,000c.yds., of which a small proportion is machine-broken. The strength of the stone undoubtedly suffers in passing through a machine, and there is a considerable amount of fine residuum for which there is little demand; notwithstanding this, and since

* A paper read before the Incorporated Association of Municipal and County Engineers at their meeting in Dublin, Sept. 25th and 26th, 1891.

they are still in their infancy, and many improvements may be expected in them in the future, I anticipate their coming more largely into use in this country. Two of the chief objections to them are their first cost and great weight, and contractors hesitate to invest their money in such unwieldy monsters. The class of machine required in Ireland is:—(1) A machine which can be easily moved from place to place, like a thrashing-machine; (2) a machine which can adapt itself to all qualities of stone; (3) a machine which will produce cubical stones without reducing their strength, and which produces little waste; (4) a machine which can be put in motion by steam, hydraulic power, or animal power; if turf could be used for fuel, it would be an additional advantage; (5) a machine strong but simple in construction. As I am dealing with machinery, I should like to make a few remarks on steam tramways and traction engines on public roads. Under the Tramways (Ireland) Act, 1881, tramways or light railways may be constructed on the public roads, provided the speed be limited to ten miles an hour and a minimum width of 18ft. be left between the outer tram-rail and the opposite fence or footpath; in the County Armagh a short length of light railway has been constructed on the side of the public road, leaving only a width of 14 or 15ft. between the ends of the sleepers and footpath; the consequence is that the road has been rendered most dangerous for animal traffic. Traction engines are also a source of danger, but if proper precautions be taken, the danger may be minimised. My experience of them is that they do considerable damage on soft roads, but very little on good hard roads. The chief danger I apprehend from them is in passing over pipes and bridges; there is frequently a more or less sharp rise over a bridge, and when the full weight of the engine is over one of the haunches it is very apt to injure the arch; the vibration of the engine also tends to shake the structure. The following are some of the methods I adopt for re-forming roads in bad order and out of shape:—(1) When there is a good thickness of metal in the road, but road hollow in centre and too high at sides. During the summer months the sides are picked off and the material screened, the fine stuff is kept for the footpath, and the coarse stuff applied to centre of road. (2) When the depth of metal is very thin. Thick sheeting applied annually will of course, after a time, bring the road to a proper section; but if the traffic is considerable, and road badly bottomed, it should be pulled to pieces, the formation surface paved with quarried stone 6in. to 8in. deep, set on edge, and coated over to a depth of 6in. with sound stone, blinded with clean gravel or sand. The leading road from Armagh to Monaghan is a good example of a road of this class; it is a low-lying road, badly drained and badly bottomed, and consists for the greater part of its length of about 3in. to 4in. in thickness of mud and broken stone resting on clay, while both sides are adorned with large banks of mud. A presentment was approved at Sessions for spending £1,000 on remaking 200 perches of the road, but it was thrown out before the Grand Jury. As regards the expenditure in this case, after deducting cost of footpath, stone depots, removal of mud banks, &c., there would be left a sum equivalent to about 1s. 6d. a yard for excavation, bottoming, &c., barely sufficient for the purpose. Owing to the opposition offered to the work, on the ground of expense, I have now given up the idea of bottoming the road, and propose applying an additional quantity of broken stone to it every year, but it will take several years before it can be got even into fair condition by this method. (3) When the travelling way is too narrow and road too high in centre. During the summer months the top of the road should be picked off, and material taken off applied to the sides. If the sides are very low, they should first be made up with pitching or clay to the required level; in the County Armagh, very few of the roads are properly bottomed, and I find it sufficient to side the roads with good clay rammed in layers before applying the top metal. By this method I have converted roads which were always in bad order into a fair state of repair.

(*To be continued.*)

A new bank is being roofed-in at Truro, having been erected for the Devon and Cornwall Banking Co. It occupies the angle of Boscawen and Lemon streets, and is being built from designs by Mr. Silvanus Trevail, M.S.A., of that city.

Building Intelligence.

Bradford.—A new goods station is about to be erected for the Midland Railway Company. The contract has been let to Mr. Coates Murgatroyd, contractor, Idle. It is intended to erect a building 384ft. by 170ft., of four floors, including a basement, covering no less than an acre and three-quarters. The floors are calculated for a load of 3cwt. per square foot, or in the aggregate for 40,000 tons of goods. The plan is a parallelogram. The elevation towards Forster-square will be masked by a detached block of offices, probably three stories in height. The ground floor of the building, with the exception of the side adjoining the new passenger station, will be an open colonnade, the upper floors being carried on a series of massive iron columns. Between the bonding warehouse and the new warehouse will be a cart road, 32ft. in width, covered with a glass roof, giving access for drays to the first loading platform, which will be 18ft. in width. Beyond this will be three sidings for goods waggons, and then another platform of 18ft. width. Access to this will be obtained by a second dray road, 24ft. wide. Each platform will have five hydraulic cranes, and hydraulic hoists will communicate with the basement below and the two upper floors. The basement will be 14ft. in height, the ground floor 26ft., and the two upper floors 16ft. each. The roof is of five spans. The ironwork has been let as a sub-contract to Messrs. Eastwood and Zwingler, of Derby. The reconstruction of the lower portion of School-street Bridge will be undertaken by the engineering department of the company, the contract for the ironwork for the bridge having been let to Messrs. Butler, of Stanningley. Mr. Murgatroyd's contract, which does not include the block of offices, alone amounts to over £100,000. The plans for the new station, like those of the passenger station and hotel adjoining, have been prepared by Mr. C. Trubshaw, the Midland Railway Company's architect, and he estimates that the works will be completed by the spring of 1893.

Clones.—The foundation-stone of the new (R.C.) Church of the Sacred Heart at Clones, near Dundalk, was laid and blessed on Sunday week. The internal dimensions are — total length 112ft., transepts 76ft. across, and nave and aisles 49ft. in clear width. The internal arrangement is that of nave, aisles, and transepts, with chancel equal in width to the nave, two side chapels, two sacristies, tower, with intended spire at the south-west of aisle, and entrance-porch to north aisle. Polished red granite monoliths will form the pillars between nave, aisles, and transepts, having cut stone plinths and moulded caps, whence spring a series of moulded arches carrying the clerestory walls, which are pierced with two-light windows; all the quoins and dressings being of a bright sandstone found in the neighbourhood, closely chiselled, forming a contrast to the blue shade stone in the wall-facings. The roofs will be open-timbered and panelled in pitch-pine, with cornices and mouldings. The contractor is Mr. Patrick Nolan, Monaghan; and the architect Mr. Wm. Hague, 50, Dawson-street, Dublin.

Crosby.—A Wesleyan chapel and school premises in Mersey-road, Crosby, were opened last week. The chapel is centrally situated between the Assembly Rooms and the railway. The architect is Mr. James Francis Doyle, of Liverpool; the clerk of the works, Mr. Samuel Gunning; and the contractor Mr. S. Webster, of Bootle; the amount of the contract being £8352 3s. 10d. The chapel is cruciform on plan, with wide nave, 70ft. by 41ft.; transepts, 26ft. by 14ft. 6in.; octagon-ended chancel, 28ft. 6in. by 21ft. 6in., with organ chamber 22ft. by 16ft. The tower and spire, 110ft. high, are placed at the north-east angle of the church. At the south-west angle of the church are classrooms, vestry, and corridor connecting the church with the lecture-room, which is 53ft. by 30ft. The style of architecture adopted is the Transitional period between Decorated and Perpendicular. The materials used externally are Yorkshire stone shoddies and Storeton stone dressings. The roof principals are constructed with hammer beams, and the spaces filled with tracery. The carving is by Mr. J. Rogerson, and the stained glass and enriched grisaille work by Mr. J. Aldam Heaton, of London. The church will accommodate about 650 people, and the lecture room 300.

Llandudno. — The foundation ston Roman Catholic church was laid last w Lloyd-street, Llandudno. The church, w to be built from the designs of Mr. J Kirby, F.R.I.B.A., Liverpool, by Mr. Williams, Knighton, Radnorshire, at a £5,000, will be Gothic in style, and bui Yorkshire stone facings and dressings of P stone. It will include two aisles, nave, ba two side chapels, and a sanctuary, with P stone columns running along each side roof will be of pitch-pine, as will the flo latter being laid with encaustic tiles in th and aisles. There will be a traceried win the east end of the church. It is also in to erect a presbytery at the end of the ch soon as the funds permit. The inside m ments of the church are 83ft. by 42ft.; sanctuary, 26ft. by 11ft. 3in.; of th chapels, 11ft. 3in. by 10ft.; and of the bap 12ft. by 10ft. The main entrance will Deganwy-street, and a tower will be add future period.

Linthorpe, Middlesbrough. — The bishop of York laid on Tuesday the foun stone of the new Church of St. Barnabas, course of erection from plans by Mr. Fowler, F.S.A., of Durham. Mr. F designs show a large church in a plain style, of pressed bricks with stone facing with stone arcades and chancel arch. building will consist of a wide nave with t aisles opening into it by arcades of five with chancel, two vestries, organ-chamb The entire edifice will not be erected at on when completed, it will afford accommodat 750 worshippers. The woodwork will b cuted in pitch-pine, with the exception chancel, which will be fitted with oak. tracts have already been entered into for th struction of the greater part of the na aisles. The entire estimated cost is £6,00 contractors are Messrs. Bastiman Broth Linthorpe, and the clerk of the works is M Sturdy, of Middlesbrough.

Torquay.—After extensive improvemen renovations, St. Mark's Church, Torqua reopened on Wednesday week. The wo completed includes the placing of a new st glass window in the east end of the ch memorial gift, the subject being "Ou in Glory," and the artists Messrs. Ha and Co. A new alabaster reredos is th of Mr. Harry Hems, as also are the oak screens in the chancel, the design bei the late Mr. J. D. Sedding. Three new s dark grey Devonshire marble have been tuted for those steps previously used at th end of the church. The altar, bishop's t and sedilia were designed by Messrs. F Tait, and Harvey, of Exeter, and execu Mr. Hems. The windows at the sides altar have been raised and decorated, window on the south side has been enlar that it may be filled with light-toned glas memorial, the stone work in connectio this having been executed by Mr. Wy Ellacombe. Messrs. Fulford, Tait, and H have designed the new carved oak alta reredos for the chapel, and Mr. Hems has out the work. It is intended to place a oak screen, partly glazed, at the west end church. The improvements have been out at a cost of £800. Mr. W. B. Co acted as clerk of the works.

Wellingborough.—The Corn Excha being entirely remodelled internally, an vided with additional accommodation f convenience of travelling theatrical com The Corn Exchange is now capable of s 800 persons, its present size, including the being 113ft. by 40ft., and 28ft. in height balcony at the south end. Two dressing constructed beneath a permanent sloping (39ft. by 25ft.), measure 20ft. by 13ft. whole of the decorative work which has a the building during the past quarter of a c has been cleaned off, the skylights hav taken out, and the place entirely re-roofed new decorations, consisting throughout o colours, show up the architectural lines to perfection. Two groups of five Wenham have taken the place of the antiquate chandeliers, at a cost of about £150. N stage, doorways have been pierced on eith of the hall, affording entrance to and exi the first and second class reserved seats. S entrances devised for performers lead dow

dressing-rooms beneath the stage, and to
v stage, which increases the length of the
g by 25ft., and this is fitted up with foot-
top-lights, and trap-doors. Speaking-
connect the stage with the dressing rooms,
are supplied with separate lavatories; the
apparatus has been reconstructed; hot-
pipes extend around the stage; water has
aid on, and the whole of the sanitary
nces have been revised. The architects
ssrs. Talbot Brown and Fisher, and Mr.
Henson has carried out the structural
ions, general repairs, and decorations. The
ost of the work is £1,500.

Engineering Notes.

TCHESTER CANAL.—The full depth of 26ft.
er will be attained in the second section of
Manchester Ship Canal, extending from
here Port to the mouth of the river Weaver,
(Friday). The work of filling the six
of cutting has proceeded without a hitch,
the personal supervision of Mr. Clarke,
engineer, Mr. Fitzgibbon, resident en-
, and Mr. Jones, the agent. The autho-
have fixed upon Tuesday next, the 29th
as the date for the formal opening of
h traffic on both Nos. 1 and 2 sections.
section, extending from the river Weaver,
thwich, to beyond Runcorn, will not be
l until some time next year. It is in the
backward state of all sections of the canal.
ale on Monday did some slight damage to
nbankments of No. 1 Section, but the work
toration has been quickly effected by Mr.
ty, the engineer in charge.

CHIPS.

parish church of Bow, E., was reopened for
worship by the Bishop of Bedford, on
esday, after internal restoration from plans
Arthur W. Blomfield, A.R.A. The old-
ned high-backed pews have been replaced by
seats, and the nave has been divided by a
l passage. The floor has been paved with
n blocks, except in the passages and chancel,
have been laid with encaustic tiles, a layer
crete being spread over the entire internal
es. A new organ, pulpit, and lectern have
resented by various donors, and the interior
building redecorated.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., L., LI., LIII., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

UNIVERSITY COLLEGE CLASSES.

To the Editor of the BUILDING NEWS.

SIR,—I shall be glad if you will permit me to draw the attention of your readers to the announcement, which they will find in your advertising columns, of new classes which it is proposed to open with a view to improving and extending the instruction in architecture and in building construction in this college.

The liberality of the Carpenters' Company has provided funds which are to be appropriated to establishing an afternoon class for architectural and structural drawing, and an evening class (also chiefly a drawing-class) for instruction in building construction. The fees of both are to be very moderate, and each is to meet twice a week. A very competent demonstrator has undertaken the conduct of these classes under my personal supervision, with the assistance of Mr. Elsey Smith.

I hope that some architects who take pupils will arrange to send them to the afternoon class. One object proposed is to assist students in preparing the drawings required, as "testimonies of study" for the Institute Examination, and otherwise to prepare them for examination. The work as far as practicable will, however, take up the subjects dealt with in my courses of lectures in architecture and construction.

It has been arranged that students able to devote a session to the preparation desirable before entering the architectural profession can attend the classes most suitable for this purpose as a series, and can obtain a "composition ticket" at a reduced fee, admitting to the whole of them.—I am, &c.,

T. ROGER SMITH (Professor).

University College, London, Sept. 22.

TO THE PRESIDENT AND COMMITTEE OF THE ARCHITECTURAL ASSOCIATION.

SIR,—It has come to my knowledge that in one at least of the subjects of the A.A. Education Scheme a gentleman has been appointed instructor who was not one of the applicants, myself and any others who applied, in accordance with the instructions issued, being passed over without being even interviewed or informed as to your decision. I have no objection to make to the gentleman appointed, he being a personal friend of mine and a capable instructor; but I do protest against the manner of his appointment as an act of injustice to myself and all others who applied in the regular way, and should be glad of an explanation.—I am, &c.,

G. A. T. MIDDLETON.

42, Bolingbroke-grove, Wandsworth Common.
Sept. 22.

BOARD SCHOOLS AT EXMOUTH.

SIR,—A week or two since you noticed the erection of board schools for 300 children at Exmouth, the clerk of the board being given as the architect. It is possible that I can give the explanation of this.

Some years since there was a competition for a school of about the same size, and the clerk of the board, who had some knowledge of building, acted as clerk of works, and, of course, had all the drawings and details in his possession. Now is it not possible, nay, probable, that it occurred to this economical board to induce their clerk to carry out another school for a nominal sum, and so save commission?—I am, &c.,

OBSERVER.

Alfred Burgess, 21, carpenter, of Alfred-street, Barnsbury, was charged at the North London police court on Monday with stealing tools belonging to several fellow workmen at the Blenheim-road Joinery works, Holloway. For the past month workmen had missed planes and gauges, and 17 pawntickets relating to the missing tools were found on prisoner when arrested. He was sentenced to six weeks' imprisonment with hard labour.

At the half-yearly meeting of the North Cornwall Railway Company, the engineers, Messrs. Galbraith and Church, reported that as to the second section, that from Launceston to Delabole, the contractors were in possession of the land, and the fencing was completed for a distance of ten miles from Launceston. The first eight miles to Splatt would be opened early next year, and of this portion the excavation was half done in the 25 cuttings, and 14 of the 28 bridges were built, and some more were in progress.

The new harbour works at the fishing village of Auchmithie, near Arbroath, which have been in construction during the last eighteen months, are now about completed. The old harbour was merely a rocky inlet on the shore. A considerable excavation was made for the new work, and the basin is inclosed by a pier. The works include a cart road from the village down to the beach. The plans were prepared by Mr. Baron, C.E., Aberdeen, and the contractor is Mr. John Malcolm, Thurso. The works have cost upwards of £4,000.

A new pulpit, erected in All Saints' Church, Clifton, Bristol, was inaugurated on Sunday. It has a base of dark griotte marble, and the columns are of Emperor's red Belgian marble. The body of the pulpit is alabaster from Derbyshire. The three panels will be filled with medallions, carved in alabaster, of scenes in our Lord's life. The pulpit was designed by Mr. J. L. Pearson, R.A., and executed by Mr. Nathaniel Hitch, who also carved the reredos of Truro Cathedral, and is now engaged on the reredos of Westminster Abbey. The cost of the pulpit is £300.

The principle of the sliding press at the British Museum is peculiar to the Museum. Its great points, Dr. Garnett says, are that it allows expansion within the edifice itself without additional building, and it enables this expansion to be effected gradually out of the income of the library without appealing for the large sums which would be required by extensive structural additions. The cost of a press is about £13, and each press holds about 400 volumes. It is practically an additional bookcase hung in the air from beams projecting from the front of the bookcase it is desired to enlarge, provided with handles for running it backwards and forwards, working by rollers running on metal ribs projecting from the beams.

Intercommunication.

QUESTIONS.

[10629.]—**South Kensington Exams.**—Would be glad to know the best textbooks to use in preparation for the South Kensington exams. in elementary architecture and 3rd grade perspective?—H. B.

[10630.]—**Christian Symbolism.**—I should be glad if any fellow-reader would tell me of a good handbook or manual on Christian symbolism, and also of a similar work on heathen mythology?—GAMBIER.

[10631.]—**Plastered Church Walls.**—Will any fellow-reader kindly inform me what is the term for, and method of, treating the walls of churches when the plaster on same presents a gritty surface? It is not "finely trowelled," I believe.—GAMBIER.

REPLIES.

[10626.]—**Sewage Disposal.**—Waring's "Sanitary Draining" gives details of arrangement for disposal of liquid wastes of country houses by the process of subsurface irrigation. By its adoption cesspools may be discarded.—DAVID BURNS.

CHIPS.

A new bank is being built at Wellingborough, for the Leicestershire Banking Company, from designs by their architects, Messrs. Goddard, Paget, and Goddard, of Leicester. The building is Renaissance in style, and is faced with Portland stone and red bricks. Mr. George Henson, of Wellingborough, is the contractor.

The rural sanitary authority of Downpatrick have adopted a scheme and plans prepared by Messrs. L. L. Macassey and H. N. Reid for a water-supply for Downpatrick. The reservoir is at Tanaghhame, and the storage reservoir at Sampson's Stone. The estimated cost is £10,500.

A third gasholder was inaugurated at the Pleck Gasworks, Walsall, by the mayor of that borough on Friday. The holder cost £8,200, and holds 600,000c.ft. of gas. The plans were prepared, and the work was superintended, by Mr. Tindall, gas manager, and the contractors were Messrs. Bentley, of Leicester, for the tank, and Mr. Jesse Tildesley, of Darlaston, for the holder.

A new board-school for 120 children was opened on Friday at Clarkston, N.B. Mr. Geo. Arthur was the architect.

An International Congress for the Protection of Workmen against Accidents was opened on Monday at Berne. The object of the Congress is to obtain uniform legislation, and to establish a Labour Bureau in the chief European countries.

The general purposes committee of the Cardiff corporation have decided to invite the Queen to open the new Cardiff waterworks next year.

The Bishop of Peterborough laid the foundation-stone on Monday of a new parish church in Kingsley Park, a rapidly growing suburb of Northampton. The church, which is the gift of Mr. Pickering Phipps, is to be Gothic in style. With the site, also given by Mr. Phipps, it will cost about £20,000.

Kew Bridge will, if the Middlesex County Council can come to terms with the Surrey County Council, shortly be demolished in order to give place to a structure more suited to the increasing traffic. The cost will probably be between £100,000 and £150,000, to be divided equally between the two county councils, if terms can be agreed upon. Surrey recognises the need of a more modern structure, but at present is not willing to bear any of the cost. Mr. F. H. Pownall, the Middlesex council's surveyor, together with Mr. C. H. Howell, the surveyor to the Surrey Council, agree that the requirements of the traffic can only be met by the construction of a new bridge, which should be 44ft. in width, allowing two footpaths 8ft. wide to a road of 28ft.

A memorial brass in honour of the late Lord Napier of Magdala, Constable of the Tower of London, was on Saturday affixed to the wall near the Constable's seat in the Church of St. Peter ad Vincula. It was executed by Mr. Matthews, of Castle-street, Oxford-street.

Noseley Hall, near Leicester, the seat of Sir Arthur Hazlerigg, Bart., is undergoing extensive alterations and improvements from the designs of Mr. J. Macvicar Anderson, P.R.I.B.A. The builders are Messrs. Treasure and Son, of Shrewsbury and London.

On Monday the directors of the Bristol and West of England Bank opened their Clifton and Redland branch bank, on the site of what was formerly known as Queen's Villa, Queen's-road. The design of the new building is Classic in character, and the premises comprise a lofty banking-room, manager's house, strong-room, offices. The buildings were erected by Messrs. R. Wilkins and Son, and the fittings were manufactured by Messrs. Howell, of Bristol. Mr. Henry Williams, of Clare-street, Bristol, was the architect.

LEGAL INTELLIGENCE.

SERIOUS CHARGE AGAINST A BANKRUPT BUILDER.—At the Newmarket Police-court last week, Francis Johnson (38), builder, of Fordham, was charged that he being a bankrupt on the 18th July, 1890, at Fordham, unlawfully did not fully discover to the trustee administering his estate all his personal estate—to wit, a debt of £28 10s. due to him, and also three ponies, with intent to defraud his creditors; at the same time and place did not lawfully deliver up to the said trustee certain stock-in-trade then in his custody at Fordham and elsewhere; after the presentation of his bankruptcy petition did, with intent to defraud his creditors, conceal part of his property, to wit, the debt and ponies above named, and unlawfully did remove a certain part of his property, to wit, a bay filly; unlawfully, with intent to defraud his creditors, did omit in the statement relating to his affairs the said debt of £28 10s. and the stock-in-trade and goods above mentioned; unlawfully, with intent to conceal the state of affairs, did mutilate and falsify a ledger relating to his property, or was privy to the same being done; and did make, or was privy to the making, of a false entry in a certain ledger and cash account relating to his property and affairs.—James Johnson (48), builder, Soham, his brother, was also charged with aiding and abetting Francis Johnson in the commission of the offences named.—Mr. Bendall appeared to prosecute on behalf of the Treasury, and Dr. Cooper defended. Evidence having been given in support of the charge, the case was adjourned for a fortnight, defendants being bound over in their own recognisances.

FAILURE OF AN ARCHITECT AND SURVEYOR.—Upon the application of Mr. Joseph Solomon, a receiving order has been made against Wm. H. Turner, architect and surveyor, of 58, Finsbury-pavement, residing at Henhams, Stisted, near Braintree, Essex. There was no appearance for the debtor, nor did the liabilities transpire.

WHAT IS "INTIMIDATION" UNDER THE TRADE UNION ACT?—PETO BROTHERS V. APPERLEY.—The plaintiffs in this case have the contract for the erection of the Cane-hill Asylum, near Croydon, which they are under a heavy penalty to complete by a certain time, and the defendant is now acting as secretary *pro tem.* of the London United Trade Committee of Carpenters and Joiners. The defendant has issued a large printed bill, signed by himself, on which appeared in prominent letters the words, "Wanted, carpenters and joiners to keep away from Cane-hill Asylum," and this bill being posted in the neighbourhood, at the entrance of the works, the plaintiffs asked for an injunction to restrain the act. Mr. Eustace Smith appeared for the plaintiffs, and stated that it was calculated to induce the men to leave the plaintiffs' service, and that had been held to be illegal. There was no strike or lock-out of carpenters and joiners upon these works, and this bill was not addressed to men of a trade-union, which would be legal, but to all carpenters and joiners, and this was beyond legal rights. Mr. Justice Jeune said he thought the law now was that it was perfectly legal for any number of persons to combine to induce others by every legal means in their power—not physical force—not to work for particular persons. The Trade Union Act allowed combination in trade disputes, and it provided that no intimidation must be resorted to. It had been held by the Courts that intimidation meant physical intimidation; therefore it was now legal for people to combine for the purpose of settling trade disputes. Calling men out was not conspiracy.—Mr. Eustace Smith said it had been decided that it was criminal to use words which intimidated, but did not amount to personal violence.—Mr. Justice Jeune said perhaps the best course would be to give the defendant notice of motion for next Wednesday. He granted an interim injunction to restrain the issuing of placards with the words complained of, or similar words, in the mean time.

The Kirk Hammerton Schools, York, are being warmed and ventilated by means of Shorland's patent Manchester stoves, the same being supplied by Mr. E. H. Shorland, of Manchester.

At the City Coroner's Court on Saturday, Mr. A. C. Langham held an inquest on Edward Parman, 24, a bricklayer's labourer, of Albert-street, Homerton. While at work on a scaffolding on premises in Hutchinson's-avenue, Aldgate, on Wednesday week, he fell from a scaffold 50ft. from the ground, sustaining fatal injuries. A labourer named Bates stated that one of the pieces of wood on which the scaffold was resting appeared to give way slightly under deceased. Mr. E. Bell, of Aldgate-avenue, the deceased's employer, deposed that there were supports under the scaffold. Henry Arthur Singleton, of Homerton-row, alleged that the scaffold was not properly constructed, pieces of deal quartering being used instead of scaffold poles. There were also no supports when he first saw it, but the next day the scaffold had been altered. The jury returned a verdict of "Accidental death."

STATUES, MEMORIALS, &c.

CANTERBURY CATHEDRAL.—The memorial t late Dr. Parry, Suffragan Bishop of Dover, i nave of this cathedral, is now fast approac completion. It has been executed in marbl Mr. James Forsyth, is between 7ft. and 8ft. and is erected against the wall in the north ai the nave, midway between the memorials of A bishop Sumner and Dean Lyall. The design is of a cenotaph or altar tomb, forming the ped on which an effigy of the late Bishop rests. recumbent figure is executed in white marble, size, and draped in the modern robes of a Bish the Anglican Church. The cenotaph is desi after the manner of the 13th century, and is cuted in alabaster and richly coloured marbl panels of which are all occupied with sculp subjects and statuettes in high relief. The l or central panel contains a seated figure o Lord, holding the Scriptures in his left hand with the right in the attitude of benediction. figure is surrounded by emblems of the Evange The two smaller panels, right and left of the ce contain representations of local saints who mostly Archbishops of Canterbury, viz., SS. phage, Augustine, Martin, and Anselm. The at the head represents the late Bishop in the a confirmation, while that at the foot shows reading from the old chained Bible in the aisle of the choir to a group of people. Ther niches at the four angles of the cenotaph conta statuettes of angels. The memorial will be unv by the Archbishop next month.

Mr. William Rowell, of the firm of Messr W. Rowell and Son, architects and surveyor Newton Abbot, Devon, has been selected among a large number of candidates for the pointment of surveyor of ecclesiastical dilapida in the diocese of Exeter, for the deaneri Totnes, Ipplepen, Moreton, and Woodleigh, dered vacant by the death of the late Mr. Reade, M.A.

With a view of coping with the incre requirements of the coal industry in the Vale, the Great Western Railway Company placed a large contract in the hands of Alde T. Goldsworthy, of Newport, Mon. Nearly miles of a fresh line between Cwm and the pits of the Ebbw Vale Company have been pleted, and are now open for traffic. A new b has been erected over the river above Abe Junction.

The London, Brighton, and South Coast way Company have, in accordance with the re of the Camberwell Vestry, commenced to effec necessary repairs to their bridges which are i parish. The London, Chatham, and Dover Ra Company have agreed to do the repairs requir the vestry to their railway bridges, which numerous, in the same very extensive parish.

At Tuesday's meeting of the City Commissi of Sewers, a letter was read from the clerk t Bartholomew's Hospital, forwarding to the mission a joint report of Mr. E. B. I'Anson, architect, and Mr. Cousins, C.E., as to the r struction of the drains of the institution, and a and section of the works proposed, and they in the observations of the Commission upon The works would cost £3,142. The plans remitted to the medical officer of health an engineer, for their consideration and report.

A carved oak screen has been placed Thomas's Church, Stourbridge, as a memoria member of the church. It was designed b W. H. Bidlake, M.A., Birmingham, and is C in design. It forms a partition which divide vestry from the chancel. The bottom fram filled in with cathedral glass to admit light; this is a richly moulded string-course carryin screen up to the floor of the gallery, and fro level it is continued by moulded columns elaborately carved canopies supporting tra arches and a very handsome overhanging The whole is richly moulded and carved, ar structure is surmounted by a carved cross. work was carried out under the personal s intendence of the architect by Messrs. Jone Willis, of Birmingham and London.

The new Sunday-school in connection Hanover-place Wesleyan Chapel, Leeds, was o on Tuesday. The new school has been erected the designs of Mr. G. F. Danby, architect, on ground immediately adjoining the chapel. building comprises an assembly room 70ft. by lighted by large windows to the front, an clerestory windows on each side. Ten class-r varying in size, are placed at the sides. The are ventilated by inlet tubes and extracting and warmed by the low-pressure hot-water sy In the basement an apparatus-room, kit stores, and other conveniences are placed. buildings are of pressed bricks, with stone dres The work has been carried out at a cost of £2,000, by Mr. P. Stather and Messrs. J. Le and Sons.

Our Office Table.

A DISTRICT SURVEYOR" calls attention to the isions of the London Sky Signs Act passed session, which are more wide-reaching and ngent in character than is generally realised. measure provides that all such signs within Metropolitan area must be removed under y penalties, unless, on or before the 3rd of ber, 1891 (Saturday in next week), the er applies in writing to the district surveyor a survey and inspection of such sign and a ificate of its safety. The district surveyor not grant a certificate unless the application be le to him within three months after the passing he Act, and no sign can be allowed to remain out such certificate has been obtained. The ding of the Act appears to include all boards of public-houses and other places business which rest upon a cornice in t of a parapet or blocking course, hey do not rest immediately upon the top of wall or building, the top of the building ng the highest part of the roof, and the cornice g a projection from the roof. It will be the y of the district surveyor to report to the ncil from time to time all such signs existing his district, and the County Council will be nd to prosecute any offender against the Act, l no cautionary notice is due to any one.

MR. HARRY HEMS, of Exeter, who, as an sociate of the Society of Architects, was one of se presented to the King of the Belgians at palace at Ostend on the 15th ult., has, since return home, sent His Majesty a series of otographs illustrative of various works—both sculpture and church furniture—he has carried for different cathedrals, churches, or public ildings in this country and elsewhere. Writing m the Palais de Bruxelles on the 17th inst., King, in graciously accepting "reproductions photography of such beautiful works, in all of ich great talent is very manifest," adds that "returns sincere thanks for the honour and ention the gift conveys, and feels charmed to rn that Mr. Hems and his friends possess such asant remembrances of their recent visit to lgium."

THE project for making a photographic survey Warwickshire, "that shire which we heart of ngland well may call," is making satisfactory ogress. At a meeting of the committee, held Birmingham on Wednesday week, under the esidency of Mr. J. B. Stone, a number of otographs of churches, timber cottages, llage streets, and geological sections were nded in by various members, were approved d ordered to be mounted and framed. It was ported that many members of the section had en at work for the survey during the summer, d that some hundreds of negatives of points of terest in the county had been secured. An hibition of prints from these negatives will be ld in Birmingham during the coming winter. was resolved that only prints executed in atinum or carbon, and on bromide paper, be cepted for the purposes of the survey.

AFTER years of mismanagement and delay, the ock and bells placed in the General Post-office ower at Sydney, N.S.W., were formally in- ugurated by Sir Henry Parkes on the 25th ult. he present contract for the clock and bells was ntrusted to Mr. Henry Daly, of Sydney, under hose immediate supervision a clock has been onstructed by Messrs. J. B. Joyce and Co., of Whitchurch, Salop, from the designs and speci- cations, and under the general direction of, ord Grimthorpe. The clock is placed in the ower at a height of 150ft. from the ground, and as four dials, each 15ft. 8in. in diameter. At further height of 60ft. above the dials a lantern as been erected on each face of the tower, in hich an electric lamp will give an hourly flash f 5sec. duration. The bells are five in number, he largest weighing 5 tons, and they chime the Cambridge (or Westminster) quarters. The oisting of the clock and bells, with all their ear and massive iron framework, was accom- olished, without an accident, by the contractor, Mr. Daly, under the general supervision of the Government architect, Mr. W. L. Vernon, F.R.I.B.A. The total cost of the Post-office, which was built in 1881, has been £270,000.

AMONG the reports issued by the Department of Mines in the Census Bureau at Washington s one showing the extent and value of the lime- stone industry in the United States. Ordinary limestone, to the value of £3,420,000 sterling, was produced last year from 1,954 quarries, by a force of 30,644 men, who received, in wages, a sum amounting to £2,025,000. The purposes for which limestone is used, and the extent to which it is employed in industries, are thus tabulated:—Building purposes, 5,405,671 dollars; converted into lime, 8,217,015 dollars; stone, for burning into lime, 184,000 dollars; flux, for furnaces, 1,569,300 dollars; street work, 2,383,000 dollars; bridge, dam, and railroad work, 1,290,000 dollars; and miscellaneous uses, 46,000 dollars. The amount of lime does not include lime produced by lime burners, who purchase stone from quarrymen, and burn it into lime. Limestone is produced in thirty-nine States and two Territories; but nearly two-thirds of the value of the product is confined to seven States. These seven States are Pennsylvania, Illinois, Indiana, Missouri, New York, Maine, and Ohio, and the value of the product in each is in the order of the States named. Maine heads the list in the value of lime produced; yet Pennsylvania produces more than twice the quantity produced in Maine. The great difference in the relative value of the product of these two States is accounted for by the fact that a large proportion of the lime produced in Pennsylvania is used for agricultural purposes, which require only inferior descriptions; whereas the lime from Maine is almost entirely used for building purposes in many of the principal cities on the Atlantic coast.

ANOTHER U.S. census return deals with the occurrence, production, and industrial uses in the United States of that class of sandstone known as bluestone. It is produced in three States only, New York, New Jersey, and Pennsylvania. The aggregate production last year was 5,126,340 cubic feet, valued at nearly £310,000 sterling, the greater part of the cost going in the labour of extraction. There are 1,793 persons engaged in the industry, and their wages are about 86 per cent. of the total cost of working. Bluestone consists of exceedingly small particles of silica cemented together with the same material. It is hard and durable, and is therefore peculiarly suitable for paving and curbing streets, and it is mostly devoted to this use. The stone is produced principally in the form of flags. Originally it was quarried for this purpose only, but recently it has been used for rubble masonry, retaining walls and bridge stone, foot pavements, street crossing, curbing gutters, flooring, and many similar purposes. The colour varies from dark blue or slate to bluish-grey, and sometimes it presents a greenish tinge, and in other cases a brown. It is known commercially by a number of names, designating approximately the region from which it is taken. A certain amount of stone is quarried from regular quarries, with invested capital and plant suitable for the purpose; but a large amount is produced irregularly and spasmodically by men who invest no capital and have no regular organisation. The formation of the stone-bearing ledges is irregular, and many are exhausted after a short time. The area of the three States in which bluestone is produced is estimated at 26,897 square miles. Of the total amount produced there New York supplies four-fifths. Of the total production three-tenths is classed as dimension stone, produced in regularly worked quarries, while a little more is classed as rubble and bridge stone. The total number of systematically worked quarries is given at 217, of which 142 are in New York.

ON Wednesday, July 1, Mr. W. A. Stuart, the manager in Sydney for the Granolithic Pavement Company, invited a large number of influential citizens, including the Mayor of the city, and many professional men and builders, to inspect the Granolithic pavement laid down in the New Imperial Arcade, between Pitt and Castlereagh-streets. The pavements in the basement and first floor were inspected, and then the company adjourned to the large dining-room upstairs in Castlereagh-street, where a light repast had been provided, and Mr. Stuart explained the process of manufacture. His Worship, the Mayor of Sydney, proposed the health of Mr. W. A. Stuart, and success to the undertaking. He referred to the life of pavements in use in Sydney, and to the especial durability of the Granolithic pavement. He believed it would yet be proved to be a most suitable substitute for asphalte, sandstone, and even other better-proved paving-stone. Mr. Stuart's energy in establishing these works there deserved their best encouragement, and he asked them to drink to his success. Mr. Thomas Rowe, F.R.I.B.A., said that, having to consider the safety as to the slipperiness of a sloping floor like that of that great Arcade, they had chosen this Granolithic pavement of Mr. Stuart's, of which they had seen samples which had been five years in use, and their experience of it was that its light colour had materially assisted in the splendid light which was now to be found in the basement of the building. He was sure Mr. Stuart had no wish to depreciate other good pavements. He knew of places in Sydney where Caithness flagging had been in constant wear for twenty-nine years, and was yet good, but he thought the Granolithic pavement second to none, and, as a local production, it was specially worthy of patronage. The toast was drunk with three times three. The proceedings were brought to a close by drinking the Mayor's health.

CHIPS.

A Baptist Sunday-school is to be built at Hull, the architects being Messrs. Mawson and Hudson, of Bradford.

A portrait of Sir James King, ex-Lord Provost of Glasgow, is to be formally unveiled next week in the municipal buildings in Glasgow. Mr. E. A. Walton, A.R.S.A., Bath-street, Glasgow, was the artist commissioned by the corporation. Sir James is painted in full official robes.

In sinking a well for the Natatorium, at Fort Worth, Texas, a flow of water has been struck which exceeds that of any artesian well known. The flow is at the rate of 600 gallons per minute and the water is as clear as a crystal. The well has a depth of 1,052ft., with a 10in. bore at the top, tapering to 5in. at the bottom. Prior to the present discovery, the largest flowing well was that at Bourne, in Lincolnshire, the discharge of which amounts to 500,000 gallons daily.

The amount of building that has been done in Toronto during the last eight months is almost phenomenal. The estimated figures show an increase of 2,132,783dols. over the value of the buildings for which permits were taken out during the corresponding period last year, the value of works being almost double.

A Celtic cross of grey Cornish granite has been erected in Iron Acton Churchyard to the memory of the late Captain Liddon. The cross is carved with panels of interlaced sculpture in relief. It is raised on three steps of the same kind of granite, on which the inscription is engraved. The total height is 8ft. 6in. The work has been designed and executed by Mr. H. Tyley, sculptor, Bristol.

Canonbury House, the historic residence of the Comptons, has been presented by the Marquis of Northampton to the parish of St. Stephen's, Canonbury, as a vicarage.

Messrs. Cunningham, Blyth, and Westland, C.E., Edinburgh, have been appointed consulting engineers of the North British Railway Company.

In celebration of the completion of a lofty circular chimney-stalk at the Ely Paper Mills, near Cardiff, the contractor, Mr. George Nelson, of Wolverhampton, entertained the men engaged on the work at dinner at an hotel at Canton, Cardiff, on Wednesday week.

By the death of Mr. Anthony Welsh, which took place with appalling suddenness in his office on the afternoon of the 19th inst., Leeds loses one of its oldest trading citizens. It was to Mr. Welsh's genius that the present machinery for the finishing of marble was due. In certain styles of work his firm stood alone. He was 72 years of age.

New Wesleyan schools are about to be built in the Mint, Holbeck, near Leeds, from plans by Mr. T. Butler Wilson, of Leeds and Harrogate.

The Russian Minister of Ways and Communication has placed before the Imperial Council a plan for the new commercial port at Theodosia, and it has been passed. The length of the protecting breakwater is to be 2,044ft., and 21ft. thick at its narrowest part. The work is expected to be finished in four years, and the Minister has received a grant of four million two hundred thousand roubles towards its construction, which will entail an outlay of twenty million roubles.

The rector of Hexham has presented an organ to the noble abbey church of Hexham, and its erection was commenced on Tuesday by the workmen of the maker, Mr. H. Farrant, of Brighton. It is being erected in the south-east bay of the chancel, and will thus be of assistance to the choir. It is not intended to remove the present organ. The new organ is of considerable power, and its cost is about £400. It has 20 stops, and the number of pipes is close upon a thousand.

Trade News.

WAGES MOVEMENTS.

CHESTER.—The Operative Bricklayers' Society is endeavouring to secure that a uniform minimum wage of 8d. per hour shall be paid to its members in this city. It is stated that whereas most of the larger firms in Chester pay this rate, the smaller builders offer 7½d. only.

EVESHAM.—Both the carpenters and bricklayers of this town have obtained an advance of ½d. per hour in wages—viz., from 6d. to 6½d.

THE LONDON CARPENTERS' STRIKE.—This dispute remains in the same phase as last week, the chief fresh feature being that a free register office for men who are willing to return to work at the old terms has been opened at the offices of the Central Master Builders' Association in Bedford-street, Strand. The United Trades Committee, to whom Mr. W. Apperley is acting as secretary *pro tem.*, during the illness of Mr. Watts, have received this week several grants from other trades, including £200 from the Operative Bricklayers' Society and a promise of a levy of 3d. a member per week till the strike ends, equivalent to about £50 weekly, and also £100 from the Miners' Union at Durham. The strike allowance was raised last week from 10s. 6d. to 11s. A great demonstration of all branches of the building trades will be held at Hyde Park next Sunday afternoon. The strike has now lasted twenty-two weeks.

An adjudication in bankruptcy has been made in the case of William Hunter Turner, of Finsbury-pavement, E.C., architect and surveyor.

The members of the Yorkshire Archæological and Topographical Association visited Pontefract Castle on Wednesday, under the guidance of Mr. Richard Holmes.

Mr. Thomas Mobley, of Mosley-road, Birmingham, the father of the brass-founding trade, died on Wednesday, aged 87 years. Until a few weeks ago he worked regularly at the works of Messrs. Tonks, Limited, by whom he had been employed for no fewer than 73 years. He was senior trustee of the Brassworkers' Association.

CHIPS.

M. Narcisse Berchére, a famous painter of Oriental subjects, born at Etampes in 1819, died in Paris on Tuesday.

The Preston town council have adopted the resolutions of the Ribble Committee and the Parliamentary Committee, expressing the view that it is not advisable at present to make any further application to Parliament with regard to the Ribble Navigation works.

Sir James Kitson has presented to the Fine Art Gallery of Leeds, his native town, Sir Frederick Leighton's picture, "The Return of Persephone," one of the most popular works in the late Academy Exhibition. The President of the Royal Academy executed the work for the donor with the knowledge of its ultimate destination.

At the Wycombe petty sessions, on Friday, Benjamin Grimsdale, builder, of Hughenden, was charged with laying stones in North Dean-road to the danger of persons travelling thereon; but the case was dismissed, no proof being forthcoming that defendant actually laid the stones, or ordered them to be laid thereon.

HAM HILL STONE.

The attention of Architects is specially invited to the Durability and beautiful COLOUR of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.
Address:—
THE HAM HILL STONE COMPANY,
NORTON, STOKE-UNDER-HAM, SOMERSET.

THE STUDY OF DETAILS.

O part of the architect's labour entails so much skill and thought as that olved in preparing details. A good design y be produced without much care in this ject; its proportions, its plan, its archi- ure may be tolerably perfect, yet it may very far short of a successful scheme, ng to an imperfect study of those details conveniences which go so far to make a kable plan. By "details," we do not y speak of architectural details—a subject te distinct from those matters which te rather to the technical and practical lifications of a design. At one time n the term "details" was mentioned, the itiate concluded almost naturally that it lied to features, to mouldings, carving, other accessories of the style of the lding. But it has now a much wider aning. The adjective "practical" would re aptly describe the details to which we fine our attention, and it must be remem- ed that every particular class of buildings its special details. Dwelling-houses l churches have their own. Of the latter, details would include such things as the ting, the arrangement of chancel stalls, yer-desk, lectern, pulpit, organ-chamber, ting and ventilation, exactly those points ich distinguish a well from a badly- anged church, and those which give the led ecclesiastical architect an advantage r his brethren less practised in such work. urches and houses are, however, built every ; their plans and details are within access, certain rules and definite information can btained regarding them. There are other ds of buildings about which the architect has knowledge. Take an elementary school. may never have designed one; he desires compete on equal terms with others o have had some practical experience of ool building. The Rules for Elementary ools issued by the Education Department nish information of a general kind, but do enter into the construction of various parts. instruction to competitors often is that ail drawings showing the fittings and the angement of a classroom have to be made ½in. or 1in. scale. One reliable course n to him is to visit a recently-built ool, and to take dimensions and details of fittings. Practical works on school lding seldom supply details, or if they do, y are perhaps inapplicable to the case in d. Suppose a competitor has to send in ails of a classroom. He must show the angement of dual desks and the size of sroom, the allowance of length to desk, about 3ft. 4in., the width gangways, the angle of desks, the ition of the windows, and other nts. He has to make his schoolroom of roper width, 18ft. to 20ft., to show the ups of desks, the accommodation to be vided, the number being calculated seated lesks and benches, these being graduated ording to the ages of the pupils. The gth of each group must be determined by width to be given to each, and thus, if n. per scholar is taken, the length of h group must be some multiple of that t. The gangways must be set out ween the groups of desks and benches, the whole group has to be determined the number of rows of benches and ks, usually three. All these are questions ch can be only answered by an exami- ion of school fittings. The technical ool, with its laboratories and classrooms, presents greater difficulties in the details. In the solution of such a problem the architect can only obtain satisfactory information by the inspection of the schools of Germany and Switzerland, or by those erected at Finsbury, the City and Guilds of London Institute at South Kensington, and a few other centres. These are not within the reach of every architect. Only one English treatise on the subject (that of Mr. C. E. Robins) in addition to illustrations that have appeared in our own journal from time to time of such buildings as that of the Owens College, Manchester, can be referred to for detailed information. Details of this sort must be the result of experience, no *à priori* reasoning is applicable; the wants of the class-room or laboratory must be found by knowing exactly the requirements of the teacher or demonstrator, together with those of the student in any particular class of science. In the event of an architect competing for a technical school or polytechnic institute, who has no experience of them, he must be prepared to devote some time to existing buildings, make figured sketches of the requisite fittings and dimensions, before he can, with any confidence, lay down the plan or prepare the detail drawings.

In making designs for such a building as a public library, considerable technical knowledge is required, as we have pointed out; it is not enough that a man is a good ordinary architect, for unless he knows something of the actual requirements of librarians, the necessary administration and the details of lending and reference libraries and news-rooms, he cannot be competent to send a good working plan. For municipal buildings a variety of technical knowledge is necessary. The departments of the borough accountant, the analyst, besides the town clerk and surveyor, are closely criticised by those officials, who soon discover any shortcoming in design. The requirements of the police and magistrates, as, for instance, in the arrangement of cells and police offices and the magistrates' court, are more technical. For example, the plan of a borough court ought to indicate the arrangement of the bench, the "dock" and its access, the witness-box, the jurors' boxes, and these imply a technical acquaintance with fittings. The boxes for jurors have to be arranged as galleries with risers, or steps, to each group. These groups must be determined by the number of seats, each of a certain allowance for jurors and witnesses. There must be a space for the public, with separate entrance. The partitions and framing must be designed of certain heights and widths, which dimensions are not a matter of guessing, but are regulated by certain rules. So, again, with a council chamber. Although an architect may dispose the seats for council in rectangular, circular, or segmental form, he must observe certain rules as to inclination or rise of benches, the number and size of groups, the mayor's platform, accommodation for town clerk, public gallery, and entrances for each class. And there is one thing to be observed here: the designer cannot properly determine the size or dimensions of his police-court or council chamber until he has calculated or arranged to scale the width and length of the seats and groups of seats or boxes according to a fair allowance to each person, so that before he can complete his general plan he must set out his fittings to scale. Each apartment, therefore, becomes a study in itself of details; the number of officials and persons to be accommodated, the unit-area for each, and the detail of the fittings or joinery, the lighting and ventilation having to be studied separately before the general plan can be determined on. How misleading and abortive it would be if we proceeded upon the other principle *à priori*—of conceiving a plan, settling the various sizes of rooms to fit our preconceived ideas, and leaving the details to take care of themselves! We should get results such as these: apartments too small or large for the accommodation, crowded and ill-devised fittings, insufficient access and egress, cramped space. No doubt this is the course often followed by competitors; they have little time to make themselves masters of these points of detail, and they fill in the fittings according to their own notions, or resembling something they have seen. Generally they hunt up plans of like arrangements, making their apartments conform to them in dimensions, but quite forgetting the differences of circumstances. Then some details are subject to alterations. Take as an instance an infirmary or an asylum. Precedents that were followed 20 years ago cannot be taken to-day. The growth of medical science and sanitation, as they affect health and mental disease, has resulted in the enunciation of certain principles of administrative and structural arrangements, which have very distinctly changed the ideas of plan and details. For example, we know what a complete alteration has taken place in workhouse infirmaries and hospital wards, chiefly owing to the need for classification and separation of the inmates, and also of floor and cubic space for each.

The details of lunatic asylums have also undergone considerable modification. Authorities have now recognised the advantage of the block system, each being independent and self-contained, and connected by corridors. Each block is a matter of study. The best arrangements of dayrooms and dormitories, infirmary wards and convalescent wards, and attendants' rooms, are points to be learned by actual experience in the working of those institutions from nurses and medical men engaged in them. The gallery system of connecting dayroom and dormitory is one point of importance. Wards for acute and other cases have to be provided also; each has to be complete in itself, with dayroom and dormitory, single rooms, lavatory, and bathroom blocks, scullery, store, and nurses' room, and it is the study bestowed on one of these self-contained blocks, with its details and fittings, upon which depends the success of the plan. The administrative department, with its stores, kitchen, and offices, the workshops and laundry, are all matters of detail, and he stands the best chance in a competition who has carefully considered and detailed his plans. Thirty years ago an architect might have neglected these points with impunity; but the requirements of Government departments have made it necessary that a considerable knowledge of special and regulation planning should be acquired. Blue-book evidence is now more necessary to an architect who devotes attention to these special buildings than tomes of artistic literature. Technical data can only be learned by personal observation and study. The details of various other buildings may be mentioned. The first class hotel calls for a special knowledge on the part of the architect of requirements and details that a few years ago was not required. Conveniences and luxuries have multiplied appliances to save labour, such as lifts, electrical fittings, and sanitary apparatus. Even the model lodging house must have an arrangement of dormitory and day-room, calculated to give the utmost comfort to each individual tenant; its offices and administration must be planned on economical principles, and its cubicles must combine all the desiderata necessary to health and personal comfort.

INSANITARY DWELLINGS AND FACTORIES IN LONDON.

SEVERAL useful sections of the Public Health (London) Act, which comes into operation on the first day of January next,

will probably create some dismay and uneasiness among owners of dilapidated and insanitary premises. We have already briefly dwelt on those provisions of the Act which more immediately affect buildings and underground rooms; but there are many others which will prevent the habitation of dwellings in such a condition as to be injurious to health. Thousands of the houses now let to tenants in London, especially in the older parts, must come within the provisions of this Act. It will be impossible for them to escape any longer the eyes of the officers of the sanitary authority. The list of nuisances that can be abated summarily is a formidable one, for the Act takes cognisance of matters that have long escaped attention. Landlords let houses that are injurious to health in many ways. They are let and occupied when they have defective and leaky roofs, stopped-up or broken guttering and rain-water pipes, choked closets, or ashpits, that have choked and noxious drains, inferior water fittings, cisterns, and damp walls. They are let also to several families when they have only proper accommodation for one, all of which things are to be henceforth dealt with as nuisances. Whether those who will have to administer the provisions of this Act will exercise their discretion in certain cases or not remains to be seen; but the law, as amended, will very materially alter the condition of dwelling-houses in many neighbourhoods. There will doubtless be some difficulty in obtaining information of defective dwellings; many insanitary dwellings will remain, while others will be reported; but it is the duty of every officer and relieving officer to give information—any person, in fact, may prefer information to the authority. Owners and occupiers will be responsible if the person creating a nuisance cannot be found. We can hardly imagine what the effect of this section will be on houses and factories which are now in a dilapidated, defective, and insanitary state in the Metropolis. Owners and occupiers will have to put them in order, or take the consequences of neglect; hundreds of dwellings will become liable for being overcrowded in the denser parts of London, and the result must be that a large proportion of them will be deemed to be unfit for human habitation, and be closed. Let us imagine a house, for example, where the nuisance is an absence of "water fittings," under section 33 of the Metropolis Water Act, 1871. Should a pipe be less weight per lineal yard or be less in diameter than prescribed, or should a house be without a separate "communication pipe," or the connections be different to those prescribed, the house in which it occurs would be placed under the ban. How many houses are without the regulation cistern, the "ball-tap" does not act, or is not of the "valve kind," overflows or waste pipes are used contrary to the regulations, there is no waste preventing apparatus to closet, and the draw taps are of the wrong pattern. A fine of £10 is imposed on any person who does not comply, or a "nuisance" order may be made against the defaulting person, and this order may take one of several forms. It may be an "abatement order," giving the person certain time to abate the nuisance, or it may be a "closing order" which prohibits the house from being used for habitation. Appeals against a nuisance order may be made to the quarter sessions if it includes a closing order, and we have no doubt this provision under section 6 will be largely taken advantage of, especially in those cases involving the execution of structural alterations. But a substantial reason must be given for appealing, and the Court will not take into account an appeal made for the mere purpose of delay.

We cannot imagine that many premises will escape the law, for the sanitary authority have power to enter premises from time to time to examine their state, and this they may do at any time of the day.

One section (25) will deal with workshops and bakehouses, will see that they are limewashed, cleansed, or purified. The authority have power to enforce sections 34, 35, and 81 of the Factory and Workshop Act, 1878, and sections 15 and 16 of the Amendment Act, 1883, which relate to cleanliness, ventilation, and sanitary conditions. How many factories and workshops and bakeries will be doomed under these sections we do not like to say. These Acts have not been enforced in many cases by the existing powers. Dairies, too, will come under close inspection; persons carrying on the trade of dairyman will have to be registered, and the cattle, lighting, ventilation, drainage, and water supply will be brought under inspection. This legislation not only applies to new but also to old buildings and premises, and the County Council reserve power to make special orders and by-laws. Under those conditions we shall see many sweeping changes and alterations during the next few years. The provisions we have referred to will have one good result; there will be a large impetus given to rebuilding of old premises and factories, and many streets and neighbourhoods will be changed in their character. "It is an ill wind that blows no one any good." In this case the nuisances that have been suffered to exist so long have brought into operation an Act that will give increased employment to architects and builders, so far, at least, as the Metropolis is concerned. Of one thing we may be sure, and that is that many old premises that have hitherto survived the operations of many recent Acts will under the Public Health London Act meet their doom, for it will be impossible to patch and mend them sufficiently to escape condemnation under one section or another.

Recent Acts levelled against insanitary dwellings have only been partially operative—that is to say, they have escaped on some grounds—but the application of the provisions of the Public Health Acts to them will have a more radical effect. Unhealthy houses and factories cannot possibly, under the new provisions, survive much longer; they have practically rendered their existence untenable. Both on structural and sanitary grounds they must succumb to the renewed attack and the amended requirements of the age.

THE PHOTOGRAPHIC EXHIBITION, PALL MALL.

THIS week the annual gathering of photographs, and show of appliances connected with the art, has been opened by the Photographic Society of Great Britain in the Galleries of the Royal Society of Painters in Water Colours. Among the architectural views there are several which deserve mention, and a few rank as works of the first order of merit. In this class, however, we miss examples from the cameras of Mr. Richard Keene, Messrs. Fry, and Mr. Essenhigh Corke. From Ireland, Mr. W. H. Banks sends a nice view of Adare Abbey, with its fine lancet windows, and a study of the Round Tower and Cormac's Chapel at Cashel. His photograph of the beautiful and rich tomb from Holy Cross Abbey deserves, too, a good word. Col. J. Waterhouse, of Calcutta, is a first-rate photographer, who evidently takes a considerable interest in historic buildings. The specimens of his work shown here are from Hallstadt, Austria; the Rialto Bridge, Venice; and autotype enlargements of views from Cairo, the Great Pyramid, the Sphinx, and the Temple of the Sphinx. The largest views of buildings in the gallery are those by the Woodbury Company, such as the carbon picture of the interior of Chester Cathedral, Hawarden Castle, and Chatsworth, shire. All these are admirable, of cour the most successful work of this co exhibited this year is a bird's-eye v Oxford from the Magdalen Tower, l up "the High," with St. Mary's spire middle picture, and Christ Church distance. The quadrangle of Mr. Jackson's new schools figures well left, and exhibits its harmony wi historic buildings of the University. Oxford, Mr. C. Court Cole also cont some small but exceedingly crisp an photographs, such as the Burne-Jon dow in Christ Church Cathedral, D at New College, St. John's College and a grand interior of the nave of Church, showing Cardinal Wolsey' vaulting in the choir to perfection. Morton takes us to Westminster where he does the interior justice; Mr. F. W. Edwards exhibits a study of the new portals and fa the north transept of the Abbey He likewise contributes a big of Carisbrooke Castle Gateway, platinotype of Sir Frederic Lei "Athlete Wrestling with a P Mr. Harold Baker, of Birmingha taken a highly satisfactory series o interior views of the New Law Co Birmingham (the design of Messrs. Webb and Ingress Bell), some of wh here shown, including those which produced when the Courts were ope July. All these are of handsome an works, either imposing in scale, portant from historic association contrast with them, we single out th Inn Staircase at Dedham," by Mr. Urquhart, for special commendation, a photograph and for the simple and ing character of the old building repre There is nothing *chic* about it, a "fetching" bits of detail: all is as and bald as possible. Yet it is this p reserve and quaint suitability whic stitutes its peculiar fitness and meri country is full of similar old pict bits of Domestic work, but Mr. U has shown his good taste in selecti example, and we thank him for sho so well. Dr. J. H. Martin sends v the south porch; the Lady chapel; t and ambulatory of Gloucester Cath but, from an architectural poi view, they are not so defined, or, p "hard," as detail study renders nec Mr. G. F. Jones, F.R.I.B.A., has figured as a skilful photographer, an we note with pleasure his contributio Gilling Castle and the Lodge, Malto gains variety by further studies fr Porte Vecchio and the Corté, Corsic Tore Waterfall, Killarney; Killic Brodie Castle and Queen's View, Loch mell. Kilmalkedor Church hangs n Mr. W. H. Banks, and then we not warm, brown view by Col. W. L. N of Cockington Church, South Devon Reeves is represented by some good in of modern houses at Weybridge and hurst, and Mr. Bedford Lemere sends of equally clear photographs of Holly House; Newcastle Music Hall; Audle Craigside Chimneypiece, by Mr. N Shaw, R.A.; Queen's-gate, Kensingt Winterford, Surrey. The Survey ment of India show some photo-etch architectural details connected wi survey of Western India; but there novelty in the process thus applied. J. Russell and Sons are to be congra for their panel pictures of the and sanctuary of Clumber Church by the Duke of Newcastle fro designs of Messrs. Bodley and The views here seen illustrate th screen and stalls, with other fittings erected, from the pencil of the Rev. Geldart, and workshops of Messrs. C

ckley. Before passing on to the general ojects, we have in conclusion to notice a ital set of small silver prints by Col. T. D. Jodrell, M.P., from the Nile, illus- ting "Pharaoh's Bed," Osirides, the meseum, and other noble ruins at Kar- k and Thebes. "Chingford Church" in a ghbouring frame, by Messrs. Webber, we ed for its picturesqueness.

The medal of the society has been well arded to the Autotype Company for the endid autogravure of Mr. F. Brangwyn's Outward Bound," one of the most forcible scapes in last year's Academy exhibition. e chromo-photos from sensitive plates, and our screens are interesting, showing how ments can be introduced by mechanical ans, aided by photography. Mr. E. S. epherd shows a small study of "A Pot of owers," and Mr. F. Hanfstaengl is repre- ted by a chromogravure of "Love's ken," a picture by O. Peck, the painter. . R. W. Robinson takes a medal for a dy picture of "A Primrose by the river m," a love scene of rural sweetness. Mr. llyer is as good as ever, and so is that otographic master, Mr. S. Gale.

CHMOND MAIN DRAINAGE AND PRECIPITATION WORKS.

THE formal opening of the works carried out by the Richmond Main Sewerage ard for the collection and precipitation of e sewage of five adjoining parishes, in- ding Barnes, Mortlake, Kew, and Peters- m, took place last Monday afternoon by e Right Hon. Charles T. Ritchie, M.P., esident of the Local Government Board. therto the sewage of these districts has en mainly discharged into the Thames; through the efforts of the Richmond ban and rural sanitary authorities (the ir above-named parishes constituting the ter authority) this state of things has been ered, and the present complete and well- ised scheme is the result. Many schemes ve been proposed and inquiries held ce the first joint board took the tter in hand in 1877, one of which was roject by Colonel Haywood for dealing h the sewage by irrigation on land at lesey. This plan was opposed by the idents. The next scheme, by Messrs. nsergh and Melliss, consisted in collect- the sewage at Mortlake, and disposing it by precipitation over 50 acres of land. inquiry reported favourably; a Bill for nfirming a provisional order to acquire d was referred to a Select Committee of House of Commons, but rejected by m, and a report was made recommending dissolution of the joint board, and that district be subdivided into several sepa- e districts, and the Richmond urban and al parishes be combined as one of such arate districts. Ultimately the joint rd was dissolved in 1885, when Mr. J. C. lliss, M.Inst.C.E., proposed to the Rich- nd Vestry a scheme for dealing with the age of Richmond and adjoining parishes the lines recommended by the House of nmons Committee, and his plans were visionally adopted, a site was purchased, an agreement between the urban rural authorities was sealed in 1886. e present works were commenced in 8; but owing to delays and diffi- ties, they have only now been com- ted. Each of the parishes has an let for the discharge of its sewage at a level, and these outlets are connected by n intercepting sewers about five miles in gth, and at a depth of from 20ft. to 45ft. ow the ground. These are of stoneware ket-pipes, cast-iron socket-pipes, con- e, and brick, and vary in size—the ner 12in. and 15in., the cast iron 16in. 24in., and the concrete and brick 27in. 0in. in diameter, their sizes being calcu- lated to receive only a limited quantity of rainfall. The stoneware and cast-iron sewers are laid in and surrounded with Portland cement concrete; and those of concrete are lined with radiating Staffordshire blue brick inverts and Gault brick arches, all pressed. The gradients are said to vary from 1 in 250 in the smallest to 1 in 1,200 in the largest sewers.

Let us now describe briefly the plan which Mr. Melliss has carried out with apparently good results at Mortlake. The sewage of 80,000 persons in the whole area between Hammersmith Bridge and Putney boundary on the north-east, and Ham House boundary on the south-west (five miles in distance), flows by gravitation to the spot selected for the works on the edge of the river, and of about 11 acres in extent. The invert of the outfall sewer and pump chamber is 25ft. below Ordnance datum and 43ft. below floor of engine-house. The dry-weather flow is estimated at $2\frac{1}{2}$ million gallons per day, and the wet-weather flow $5\frac{3}{4}$ million gallons. Overcharging of the sewers cannot well take place, for when the sewage rises to a certain level in the sewers and pump-chamber, the fact is recorded by an automatic arrangement of electric bells to the foreman and engine-room. The main sewer ends at the pump-chamber, where it is 3ft. 4in. in diameter. There are several manholes of special self-cleansing sections. We will suppose the crude sewage has reached the works. It passes through a strainer of iron rods which arrests solid matters of some size, into the pump-chamber. Here are three sets of single-acting plunger pumps for lifts of 43ft., driven by three 50H.P. compound horizontal engines, each set capable of raising 4,000,000 gallons per day, and together 12,000,000 gallons. Here it receives a small dose of milk of lime from the vats in the chemical mixing room, and is pumped up to a covered channel along the side of pump-house, then flows into an inlet channel for treated sewage, which runs along the upper side of the 11 precipitation tanks. In its course, before entering this channel, it is further strained by passing through a close-bar strainer, and receives in a second chemical mixing-room a dose of a solution of sulphate of alumina, carbon, and iron, being thoroughly mixed therewith by an agitator. The treated sewage is then allowed to flow into one or more of the precipitation tanks, as required, the liquid flowing over weirs of the entire width of the tanks; the first, or inlet weir, running along the upper end, and the overflow weir, for effluent water, at the lower end of the tank. After passing over the latter, the effluent is carried away by a channel to the outlet at the north-east corner of works into the river. During the flow of the treated sewage into the tanks precipitation takes place; the precipitate or matters held in suspension sinks to the bottom of tanks, while the supernatant water, cleansed of its impurities in suspension, and much of those in solution, flows over the lower weir into the effluent channel. When required, the effluent water can be allowed to enter filter-beds, made of layers of gravel, sand, and carbon, the surface being covered with a layer of earth sown with grass. These filter-beds, eight in number, occupy $1\frac{1}{4}$ acres, and are partly high-level and partly low-level, and are located below the precipitation tanks not far from the river's edge. A channel for low-level supernatant water with valves runs all round these beds, and an inlet channel for low-level filters. The tanks are emptied once a day, a period of repose being given each by shutting it off from the inlet treated sewage channel by valves; the water is then drawn off by a floating valve, the upper portion of the water flowing on to the high-level filter-beds, and the lower portion to the low-level filter-beds.

The collection and disposal of the sludge and precipitate forms an important part of the scheme. The tank bottoms have a slope to form a channel along one side, and the sludge and water gravitate into a long covered passage, thence into the sludge chamber beneath the press-house. Subsidence here is resumed, the supernatant water is drawn off and flows back into the pump chamber to be re-treated. The sludge, deprived of much of its water in the chamber below the press-house, is lifted by pumps into iron receivers, each containing a charge for one press. Here it is limed and forced by rams into presses, the water pressed out passes to the pump-chamber, while the sludge cakes, measuring 3ft. square and $1\frac{1}{2}$in. thick, are removed from the presses. These cakes are odourless, and may be stored away for use as a manure, their value being, it is stated, rather higher than the best farmyard manure. The board intend to utilise these sludge cakes for raising low-lying land. The process of pressing and the removal of the sludge cakes shown to the visitors on Monday is extremely simple and cleanly. The presses comprise three of Messrs. Johnson and Hutchinson's 36in. square machines, each containing 30 plates and chambers. These are provided in duplicate. The present sewage will produce 10 tons daily of this solid residuate. We may add that the works have cost about £120,000, the annual cost of pumping the sewage and other operations is put at £3,500, and this, together with repayment of capital and interest, will not, it is expected, exceed a rate of $7\frac{1}{2}$d. in the pound. The contractors for the sewers are Messrs. Nowell and Robson, of London; the pumping and precipitation works have been completed by Mr. W. Webster, of St. Martin's-place, Mr. C. Dickenson being the first contractor. The pumps, engines, boilers, and mixing machinery have been erected by Messrs. Jas. Simpson and Co., of Pimlico; and the presses have been supplied by Messrs. Johnson and Co., of Stratford. Mr. George Wade, of Chelsea, has erected the cottages for workmen on the southern side of the works. Mr. James McKie, Assoc.M.Inst.C.E., acted as resident engineer. Each set of pumps, with its engine, can be worked separately, one being sufficient for dry weather; the third set is kept in reserve in case of accident. Space is provided for two more sets of engines and pumps. We may mention that the effluents exhibited were very clear and satisfactory; the station buildings and tanks have been carried out with much care in a liberal manner; the group of buildings, with its ornamental square chimney shaft from boiler house, presenting a far from unsightly range of red-brick structures, with gabled ends and rusticated doorways and angle quoins. Mr. Ritchie, in his speech, congratulated the local authorities on the successful completion of the works.

THE NUNHEAD AND SHORTLANDS RAILWAY.

A VISIT was paid on Wednesday week by the Society of Engineers to the Nunhead and Shortlands Railway and the Crystal Palace District Gas Company's works.

The line, now in course of construction, commences by a junction with the L. C. and D. Railway Company's main line at Shortlands station and terminates by a junction with their Greenwich branch at Nunhead Junction. The object is to develop some of the estates through which it passes, and an alternative route for their main line traffic into the Metropolis *viâ* Nunhead Junction and the South London Line. For a suburban railway, the country passed through is very open, the only building property actually taken being at Catford, yet the number of bridges is considerable, averaging about five per mile; this is mainly due to the number of bridges erected for the accommodation of the landowners in laying out their estates. All the bridges will be of an ornamental character, and

the slopes of the cuttings and embankments will be planted with shrubs and trees.

Amongst the works are included three bridges over existing railways, two short brick viaducts, and a retaining wall in Catford, besides other public road and accommodation bridges. The bridge over the South-Eastern Railway, near Catford, will consist of two N-truss girders, with a skew span of 113ft. each, with underhung cross girders and rail-bearers. That over the London, Brighton, and South Coast Railway, at Brockley, will consist of three girders, 100ft. span each, of a type similar to those just mentioned, the centre one being between the two lines of rails. The floor in this case will consist, as the headway is limited, of troughs, built up with angle bars and plates.

In the case of bridges carrying roads over the railway, the superstructure consists of girders and jack arches, except in three cases where headway is limited, and longitudinal-built trough flooring has been used, supported by a transverse girder on columns in the six-foot way.

In the case of road bridges under the railway, trough flooring will be extensively used, on account of the limited headway in most cases. This construction also enables the floor to be made perfectly watertight.

Steel is being used for the bridge work throughout, the columns in the roadways and ornamental work being of cast iron. There are to be five stations on the line, in addition to those already existing at Shortlands and Nunhead. The work is being carried out under the superintendence of Mr. John Wolfe Barry, the company's engineer, and Messrs. Lucas and Aird are the contractors.

The adjoining works of the Crystal Palace District Gas Company were afterwards inspected. A new gasholder is in course of construction, which will consist of three lifts, the inner one being 163ft. 6in. diameter, and each lift being 40ft. 6in. high; the total capacity of this holder will be 2,500,000c.ft. The present gasholders, of which there are five, have a total storage capacity of 3,825,000c.ft.

THE VICTORIAN REGISTRATION OF ARCHITECTS BILL.

THE Royal Victorian Institute of Architects —acting, alas! how differently from the London R.I.B.A.—having invited those practitioners in architecture who are neither members of their Institute nor of the Architectural and Engineering Association to meet in the Institute rooms, Collins-street, Melbourne, on Thursday evening, August 13, the conference took place accordingly, the object of it being to discuss the proposed Draft Bill for the Registration of Architects. There were present several members of the Registration Committee of the R.V.I.A., the Registration delegates of the A. and E. Association, and about fifty outside architects. Mr. G. C. Inskip, F.R.I.B.A., President of the Institute, occupied the chair, and in opening the proceedings strongly supported the Bill, which, he said, had been in principle before the Victorian Institute for two years, and which had recently been altered and amended in accordance with suggestions received from architects. It was not so much for the benefit of the architect as for the advantage of the whole community, that registration was necessary; and seeing that the dentists, the veterinary surgeons, and the surveyors were all registered or licensed, it was about time that the architects were protected also, or rather that the public should be protected from those who unjustifiably called themselves architects. The Bill had been carefully framed, so as not to interfere with any existing rights. The Institute had invited the outside architects to help them with the measure, because it was to the advantage of the whole body of practitioners that it should become law. Mr. A. M. Henderson, one of the Registration Committee, having explained the principles and objects of the Bill, Mr. E. G. Ovey, as an architect not connected with either the Victorian Institute or the Association, moved "That it is desirable that a Bill for the registration of architects should be placed before Parliament as early as possible, such Bill to conserve all existing interests." This was seconded by Mr. Wells, and was strongly supported by Mr. Duguid, who remarked that had he merely looked at this Bill from a personal standpoint, he should have felt inclined to hold aloof from it, because the professional man who had qualified himself by study and practice had nothing to fear in competition with the amateur. But the matter concerned the public more deeply than the profession. He was glad to see that this latest Bill had enlarged the scope of registration, as there were many men who had entered the profession through by-ways, and were ornaments to it. Some of these men, owing to the difficulties which they had surmounted, were better architects than the curled youths whose fathers had been able to pay heavy premiums. Mr. Craven considered it, in the first place, a weakness in the Bill that it provided no protection to the public against the jerry builder. If the Bill were passed, there would be nothing to prevent people who were not architects going on under some other name and building bad houses. It was a well-known fact that builders, contractors, &c., designed houses and acted as architects. The Bill would not stop them. Secondly, no provision was made allowing an engineer engaged in the construction of a railway to design the station buildings, &c., for it. He would support the general principles of the Bill, and thought it a move in the right direction. The motion was carried with only two dissentients. The Bill was then read by Mr. Billing, hon. secretary of the Victorian Institute, and discussed clause by clause. The chief differences of opinion arose over clause 2, section 4, which provides for the registration of existing practitioners.

Mr. Little said they would defeat their own purpose if this were passed as printed, because it opened the door for any jerry builder who had been practising three years as an architect to become registered. Something similar had happened under the Victorian Dentists Act, the consequence being that instead of 70 registered dentists, which was about the number of properly-qualified men, there were at least 400. Mr. Billing directed attention to the next clause, which gave the general council power to exclude the jerry builder. Mr. Craven thought that the person who had been *bonâ fide* engaged in practice as an architect for two years should be eligible for registration. Clause 2 stipulated three years. No suggestions of any importance were made with regard to the remainder of the Bill. The meeting then proceeded to the election of five outside architects to co-operate with the registration committee in giving an improved shape to the Bill. Messrs. Marsden, Craven, Duguid, Little, and De Garis were appointed.

ARCHITECTURE IN THE ARGENTINE REPUBLIC.

[SEE ILLUSTRATIONS.]

CHURCH, PARSONAGE, AND HALL, ROSARIO DE STA. FE.

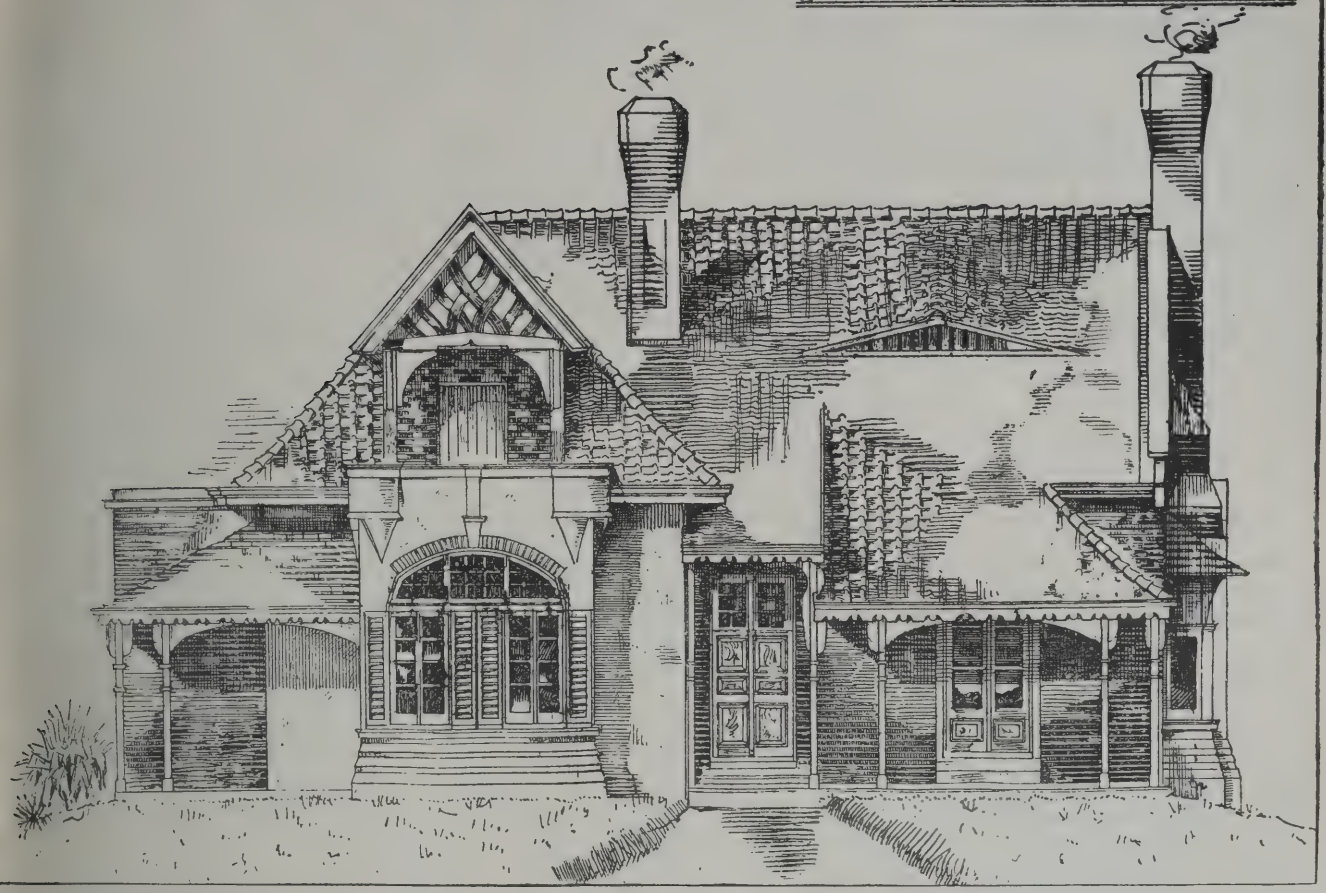
THIS church is designed for the English, Spanish, and German congregations of the Methodist Episcopal Church of North America in Rosario. The main front here illustrated faces the "Gran Boulevard." The hall is placed behind the parsonage. The lower story, it will be noticed, is plastered, while the upper is of face brickwork. The former is the universal mode of finishing brickwork in Argentina, on account of the rough bricks that are used, and bad quality. They are 12in. long, 6in. wide, and 2½in. thick. The brickwork there is done by Italians, and it is difficult to obtain from them good face-work and proper bonding at the same time. The effect is good when exceptional care has been taken, owing to the thin bricks. The style of the building is a simple treatment of Romanesque, with flat-pitched roofs and projecting eaves. It is proposed to construct the great wheel window with hard wood of the country, and well protected with white-lead paint; also the brackets of the tympanum and eaves, with the panels picked out with bright colours.

The windows of the church are all plain, without tracery, except the wheel window before mentioned, and glazed with plain glass of small squares, with coloured borders only, those on the sunny side to be provided with curtain blinds of green shade. The roofs are of slate from France. The roofs are of very simple construction. That of the church is of the ordinary queen-post type, boarded at tie-beam level, with centre portion between the posts open and decorated, giving greater height to the interior and simplifying the means of ventilation, and at the same time preserving an air-space between ceiling and outer roof, so necessary in hot climates. The roof over the hall to be similar in type; the queen-posts carried down to floor-level. Th roof is of very light construction, no timber bei more than 6in. by 3in.; this roof to be cover with corrugated iron.

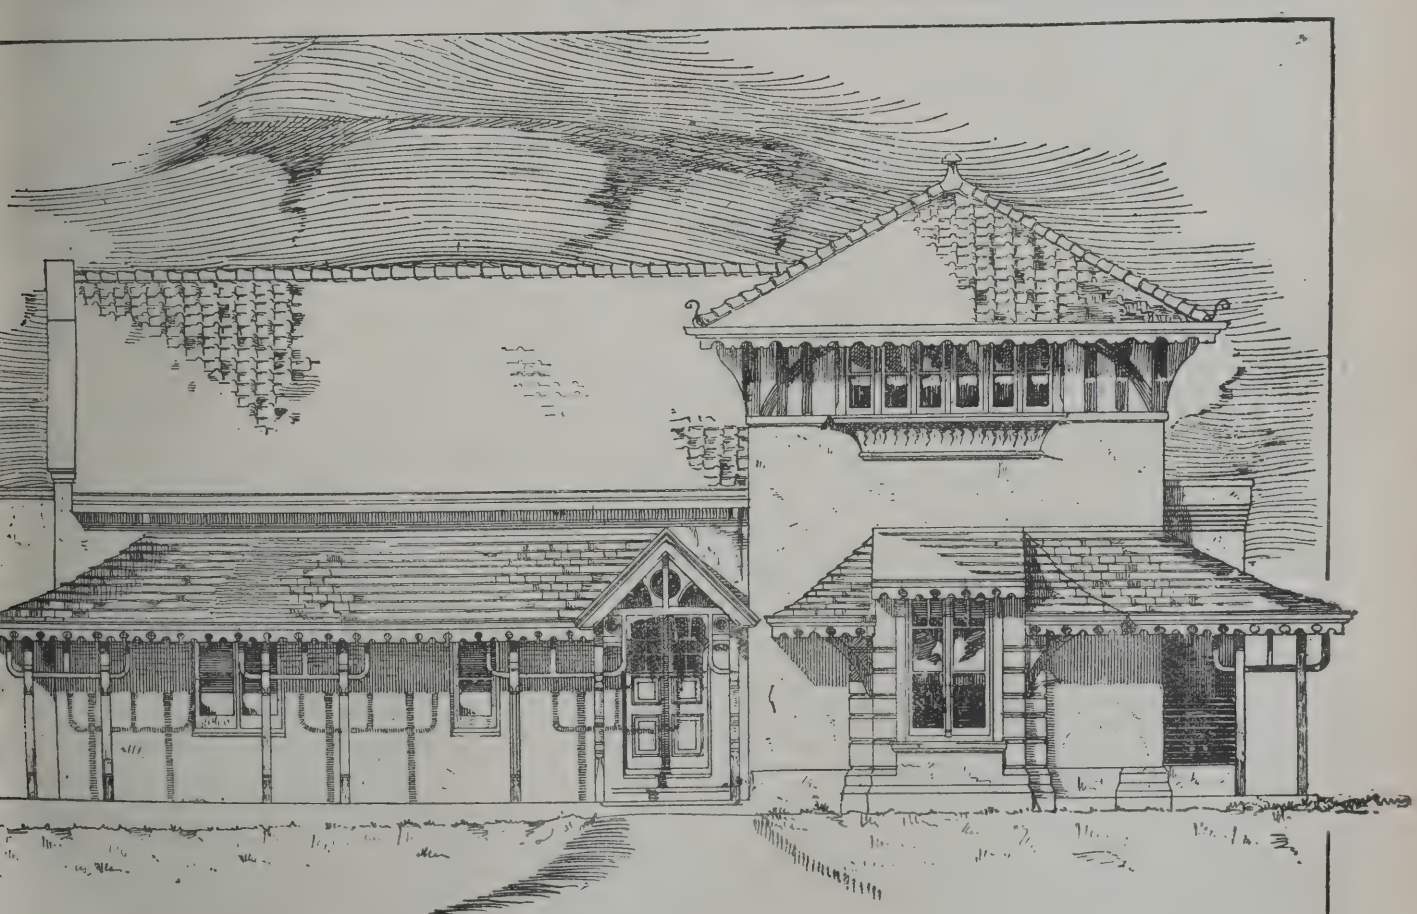
In the church, provision is made for futu galleries over entrances and in the transep behind tower; the latter will contain the stai case for both galleries. The entrance to hall under the "belvedere" of parsonage, with cloa rooms adjoining. Wherever possible, balconi are provided in the fronts of all two-stori houses in Argentina, and the great difficulty the architect is to prevent them from having crushing effect on the building, and to keep the shallow, as the natives of the country spe much time in the open air; they also requi balconies on the ground floor, however sma when it is possible to get them. The windo are always French casements, hung to op inside, and provided with Persiana shutters ope ing outside, and all the openings and doorwa as large as possible for the free circulation of a The rooms of dwelling-houses are usually ve lofty; these are only 15ft. 6in. from floor floor. This presents a difficulty in giving pro scale to a domestic building. The hall a parsonage are estimated to cost 11,000dols. gol

SUBURBAN HOUSES.

These are a pair of semi-detached houses English residents to be erected outside Rosar facing what is known as the English Plaza, t property of the English Athletic Club; th have also a neat pavilion on the ground. T type of house, with a small garden in front, h not yet been adopted. The style of these somewhat Italian, with flat projecting ro covered with French tiles, giving deep shado at the eaves, treated in the same manner as the parsonage. Here the walls generally plastered and picked out in panels, with br dressings, pilasters, &c., giving relief to plaster surface, and giving colour. It is p posed to use machine-made bricks; these made only of the English size. There is a gall running the whole length of the front bracke out from the wall; this long line, with shadow, assists in counteracting the great hei of the floors, as noticed before. In the to there are three floors, the first floor being reac off the half-landing of the staircase; the hous to be fitted up with water services, and all latest sanitary appliances; the drains to be tal to a sump-hole or pit at the back of garden.



The remaining designs are for residen known as "Quintas," outside of the town, only of one story in height, quite detach They are planned specially for the clim adapting them to the requirements of Eng customs. In the centre is a wide hall, open airy as possible; on one side are the bedroo on the other the living and reception roo the patio behind pertaining somewhat of a qu rangle, with buildings on three sides only. one side of the patio and the back are ran the kitchen offices and servants' accommodati with means of communication between dining-room and the kitchen for the wi months. The usual custom for roofing this c of house is by iron joisting, with arches betwe covered with two rows of bricks, laid diagona and paved with baldoza tiles; one of th illustrated is so roofed. The great difficult to keep them watertight, owing to the c traction and expansion of the ironwork and baldoza tiles, from the great heat of the sum sun. The best roof of the country is, perh the tile roof—the tiles are imported from Fra principally Marseilles; the baldoza tiles come from the South of France. It is alw necessary to provide a balcony for shade du the hot months of the year. The estimates these ranged between 4,400dols. gold 5,000dols. gold.



The formal reopening of the Abbey Churc Selby, which has been restored under the direct of Mr. J. Oldrid Scott, is fixed for Tuesday mo ing, October 13.

Mr. Robert Stannard, C.E., who died last w at Brighton, was for many years in the emp ment in a confidential capacity of Messrs. L and Aird, and during the construction of the and Barnsley Railway had the entire su vision of the Howden section, which exte from South Cave to Heck. The deceased had t sons and four daughters, one of the former ma ing the popular writer so well known as J Strange Winter, and one of the latter is the of Mr. G. A. Sala.

THE NEW BOROUGH MARKETS, HALIFAX.—BISHOPSGATE SCHOOL FOR GIRLS.—INTERIOR OF MR. T. E. COLLCUTT'S DESIGN FOR THE NEW SOUTH KENSINGTON MUSEUM BUILDINGS.—THE MANOR HOUSE, ARRETON, ISLE OF WIGHT.—COTTAGE HOMES, WEDNESFIELD, NEAR WOLVERHAMPTON.—BUILDINGS AT ROSARIO, SANTA FE.

Our Illustrations.

HALIFAX IMPROVEMENT SCHEME.

These buildings, the subject of our illustration to-day, will effect a remodelling of the centre of the town of Halifax, the scheme being associated with the widening of the adjacent streets and other improvements. Markets in the North of England are important municipal buildings, and as a feature of everyday life attain a more appreciative value than in the Metropolis. The scheme illustrated comprises in the general market 214 stalls and 45 butchers' and other shops; in the fish market, 14 stalls and 15 shops. The arcades will provide 16 shops, and to the several streets there will be 28 shops with residences over. The corporation have decided to proceed with the entire scheme at a cost of £40,000. The architects are Messrs. Leeming and Leeming, Victoria House, 117, Victoria-street, Westminster.

BISHOPSGATE GIRLS' SCHOOL.

The buildings shown in our illustration have been erected for the trustees on a site in Spital-square, Bishopsgate, E.C., in place of the old buildings in Skinner-street and Primrose-street, demolished by the Great Eastern Railway Company. The school building has accommodation for 550 pupils, and is planned to meet all the requirements of modern middle-class education, including an art school, music school, with separate and sound-proof practice-rooms, cooking kitchen, &c. All the floors and staircases are of fireproof construction, classrooms are large and lofty, and the floor space of each is larger in area than that demanded by the Education Department. Fireplaces are provided with ventilating grates in all classrooms and cloak-rooms, and in addition there is a complete system of heating by hot water. Vitiated air is drawn from each room through separate trunks, and carried up to extractors in roofs. Care has been bestowed on the drainage and sanitary appliances, all traps and pipes are ventilated, and the risk from foul air accumulating reduced to a minimum. The chapel and clergy-house, although used in conjunction with the school buildings, are not a part of the same foundation, and were erected for the rector of St. Botolph, Bishopsgate, the Rev. Prebendary Rogers, who is also chairman of the school trustees. The buildings externally have been faced with Lawrance's red bricks, and terracotta of a buff colour has been largely used in all dressings and ornamental features of the design. The roofs are covered with green slates. The architecture is founded on the collegiate buildings of the Jacobean period. Our illustration is taken from the original exhibited in the Royal Academy of this year; but in the execution the design has been somewhat modified. The total cost of the buildings is about £18,000. The contractors for the work were Messrs. Woodward and Co., of Finsbury, Mr. P. J. King being clerk of works. The terra-cotta is by Messrs. Cliff, and the ornamental wrought ironwork is by Messrs. Richardson, Ellson, and Co. The buildings have been designed by Messrs. T. Chatfeild Clarke and Son, who were successful in a limited competition.

SOUTH KENSINGTON MUSEUM COMPETITION.

We complete our series of the designs submitted in this competition this week by giving the Interior of the Central Hall of Mr. T. E. Colcutt's design. We commenced our illustrations of this competition in our issue of August 7, and have given one or more each week since. Readers who desire to preserve the series and have missed any of the numbers are respectfully advised to do so at once, as the demand has been considerable, and they will soon be out of print.

THE MANOR HOUSE, ARRETON, ISLE OF WIGHT.

Mr. Percy G. Stone, F.R.I.B.A., has just issued to subscribers the second part of his interesting work on the ancient buildings of the Isle of Wight,* and we have to-day published an illustration, with the author's permission, from the drawings which this folio contains. The part is chiefly devoted to the domestic work of the East Medine, with copious illustrations, plans, and marginal diagrams, some few being reproductions of old engravings and early views of historical importance. The series commences with Appuldurcombe, a big Classical mansion erected in the early days of the last century. Arreton, the subject of our lithographic plate, comes next, then Barton Manor; Bridge Court, near Godshill; Great Budbridge, Haseley Manor, Merston Manor, Nunwell House, Stenbury Manor, and Yaverland Manor. The volume closes with descriptive notes and copious references in connection with the ecclesiastical buildings, followed by a similar treatment of the manors and houses of the East Medine. Turning now to the subject which we print as a representative sample, we take the following particulars from the account of Arreton Manor House given by Mr. Stone. Little is known of the early history of Arreton beyond its connection with Quar Abbey, to which it was given by Baldwin de Redvers. In the time of the Confessor it was held by the King. The endowment of Arreton remained in the possession of the Abbey of Quar till the Dissolution, when it fell, with the rest of the monastic possessions, into the hands of the Crown, in whose tenure it seems to have been till the reign of James I., when it was purchased by Sir Levinus Bennet. In the next generation it changed hands, being bought by Thomas Lord Culpeper, Governor of the Island from 1660 to 1667, whose daughter and heiress, marrying with Lord Fairfax, of Leeds Castle in Kent, brought it into the Wykeham-Martin family, who still hold it. The present house, pleasantly situated on rising ground at the foot of Arreton Down, was probably rebuilt by Sir Levinus Bennet. It is of the usual Jacobean type, with two projecting wings and a central porch, over the entrance of which is cut the date 1639. This porch, of which we give a detail, seems to have been an after addition, made probably when the porch-building mania set in. The inner door is apparently original, and has a somewhat quaint knocker of simple form in iron, while the oak beams forming the ceiling of the porch are moulded and stop-chamfered. The west wing is a modern addition of recent years. The woodwork in the drawing-room, the usual parlour of the period, adjoining the great hall, is, of its kind, excellent, though it has suffered somewhat by "doing up," some of the material being brought from elsewhere, presumably, in the house. The pediment on the screen by the door, a good piece of Early Jacobean work, has been sawn in two to serve its present purpose, and in refixing turned upside down, and a pilaster, surmounted by a typical figure, is planted on the panelling of the east wall of the room. The panelling is good, but the chimney-piece is the glory of the apartment. It is well proportioned, and elaborately worked with more refinement of *technique* than is usually found in the work of the period. The bedroom over also contains a somewhat later chimney-piece v of note, with a Flemish carving representi "Offering up of Isaac." In the hall the jambs and head of the original fireplac remain. To the east of the house is a 16th- century *columbarium*, entered by a four-c doorway, while on the south stands a fine with a roof worthy of notice. Adjoinir churchyard is a Jacobean cottage of a su type, probably a farm-bailiff's dwelling, nail-studded door and iron knocker still re ing *in situ*. Most of the plates in the bo drawn by the author, but we note some fro hands of Messrs. Bolton, H. P. Burke Dow and Maurice B. Adams.

* The Architectural Antiquities of the Isle of Wight from the 11th to the 17th centuries. By Percy G. Stone, architect, 16, Great Marlborough-street, London.

COTTAGE HOMES, WEDNESFIELD, NEAR WOL HAMPTON.

We give in this number a general and views and various plans of the above h which have been erected at Wednesfield, fo Wolverhampton Poor Law Guardians, fo purpose of removing the children from the house, so that they may grow up free fro contaminating influence of the tramp war with a better prospect of becoming useful bers of society. The homes have been c out from the designs and under the superi dence of Mr. Geo. H. Stanger, architect, W hampton, whose plans were selected in competition. The original design was fo homes, each to accommodate thirty childre of these, only eight have, at present, been Before the children are admitted to the h they are detained two or three weeks i probationary wards of the lodge, in or see that they are free from infectious dis Foster parents have charge of each hom wife attending to the household duties, the husband acts as an industrial trainer. this training, they have about twenty ac land that is cultivated by the boys, h which, they have a block of workshops taining tailors', shoemakers', tinmen's carpenters' shops, also a bakehouse, whe the bread used in the establishment, and workhouse, is made. The homes and buildings are sufficiently explained by plans, but at the back of the work a swimming-bath has been built. schools are divided into separate d ments for boys, girls, and infants, with rooms for each, the main schoolrooms h glazed screens, thus making additional rooms when required. A portion of the grounds are covered in to be used in wet we Messrs. Bradney and Co., of Wolverhan have erected the whole of the buildings bricks made upon the site, with Stanton strings and dressings, the roofs being co with red Staffordshire tiles.

BUILDINGS AT ROSARIO, SANTA FE.

(For description and further illustratio page 460.)

The Glasgow town council, at their meet Monday, received a report from Mr. G. M ninghame, C.E., of Edinburgh, on the condi Glasgow Bridge, in which he recommended t delay should take place in applying for l mentary powers to reconstruct the bridge. I Convener Mason, in presenting the report, that the foundations of the bridge were in an but a satisfactory state, and that at the soo least two years must elapse before a tem structure could be erected. The report was ad and it was decided to adjourn for a fortnig consideration of the desirability of advertisi competitive plans for a new bridge.

A serious accident occurred on Wednesday at the new swimming-bath at Stafford, the opening of which had been fixed to take pl the following day. The water had been turn for the first time, the mayor and several me of the town council being present, and th swimming-bath was filled to overflowing, the wall of the bath burst. Fortunately th dent happened on the side nearest the rive the escaping water did consequently little da The baths have been erected from designs borough surveyor. The Corporation staff c the site and put in the foundations, and then i tenders for the different branches of the work Bromage, of Longton, contracted for the bu work; the amount of his contract being £ The engineering part of the contract amoun £1,025. The swimming-bath is 91ft. by 41ft. in the clear. The bath itself is 80ft. long wide, and from 3¾ft. to 6½ft. in depth, with face area of 2,640 superficial feet, and con 80,437 gallons of water.

WAYSIDE NOTES.

EINVIGORATED by a two months' re- cess, our County Councillors have resumed ness at Spring-gardens. Taking up the ad of argument summarily dropped at the mencement of the holidays, the councillors proceeded with the consideration of the ral improvement schemes for Metropolitan ways. With the recommendation of the rovements Committee before them—to the t that the most pressing improvements are: Sandys-row to Bishopsgate; (2) Boziers- t, Tottenham-court-road; (3) the widening he Strand at Holywell-street; and (4) the ning of Nine Elms-lane, Battersea—the ncil engaged in much debate at Tuesday's ting. Debate, apparently, void of much l fruit, if we may judge by the resulting lution, that only the Sandys-row scheme be ed to, and that the other proposed improve- ts be adjourned.

here is some talk about the Council's not doing its whole heart this, that, and the other, use, forsooth, their term of office shortly res. Councillors might well call to mind that sion, in the American States, when a certain raordinary darkness settled upon the earth, and ed a panic to take hold of the members of the embly then sitting, who adjudged that the ck of Doom would shortly be heard. Where- n a certain serenely-minded Quaker, con- ring that, should the Last Day be really at d, he had best be found at the post of duty, in his place, and moved that "candles be ught and business proceeded with." I should fer to see the County Council call for candles the darkness thickens, and proceed heart and l with business, leaving matters at the expira- n of their term to the care of Providence. One en feels tempted to neglect a piece of work ause of some change in the details thereof— is drawing a plan, and having finished nking-in" there remains a quarter of an hour o before we must start to catch a train. Shall waste the whole time in twiddling finger and mb because it is not "worth while to com- nce the process of colouring"? I fancy not. ter that there should be an honest stain where have had to leave a breadth of tinting, than t we should have squandered the irrevocable nutes.

A useful work was inaugurated on Monday , when the President of the Local Govern- nt Board opened the new sewage works at rtlake, part of the Richmond Main Sewerage eme, to avoid the pollution of the Thames. e principle adopted by the engineer to the lertaking is the one that seems to have wered the most practically for drainage on modern system. The sewage is treated by ious processes, and at last the effluent water s off comparatively pure. The "sludge" is ssed into marketable manure-cakes, and thus waste which the political economist deplores the ordinary system of free-running sewer- uths is prevented. It is said that the new hmond works have been running now for a tnight with perfectly satisfactory results.

Mr. Ritchie's speech subsequent to the in- gural ceremony was interesting and instructive, are all the remarks of the able President of the cal Government Board. Speaking of negligent l dilatory local authorities, Mr. Ritchie said t they did not realise their great responsibility h respect to the drainage and water-supply, l pointed out, as a fact not generally known, t as the law at present stands, any number of epayers could, if they considered that the al authority had failed to provide proper inage and water-supply, complain to the cal Government Board, whose duty it would to make inquiry, and if the allegation was nd correct, to take steps to compel the local hority to do its duty. It is evident, however, Mr. Ritchie pointed out, that people are too rt to make use of this power, as it is rarely nd to be utilised.

The *Standard* thinks that at present the spect of an early solution of the much-vexed estion of the future of the London water- pply does not look very brilliant. If the ution is to be some total revolution in methods, h as the bringing a volume of water from tant lakes, &c., then certainly the out- k is not brilliant, and the less so, because the big Midland cities are grasping old Father Time's forelock with hearty good-will, and getting before us in the way of water supply, as I hinted some time back. Thus, the London County Council's engineer has a scheme for bringing water from the sources of the Elan and the Claerwan, in the counties of Radnor and Cardigan, at a cost of nine millions sterling, for two hundred and thirty million gallons daily; while at the same time the Corporation of Birmingham, advised by Sir Robert Rawlinson, wish also to take a supply of water from these sources, and are preparing to go to Parliament next session with a Bill authorising them to make the necessary arrangements.

Sir Thomas Farrer, vice-chairman of the London County Council, has followed Sir John Lubbock's lead, and resigned this post on the Council. Sir Thomas Farrer's presence in the Council added some colour to the pretensions of that body to take to itself the water supply. For Sir Thomas has made most of the ascertained facts *re* London water-supply question his own, and, in a report that he has submitted to the Council, much of interest concerning the question may be found. Rather an alarmist report in a sense, yet true withal, as I should say, while at the same time believing that the County Council is not the proper "water authority" of the future. Already, says the report, the Thames is drawn upon to excess, and the Lea can yield no more than it is giving; wells are not to be relied upon, and are subject to local claims. The report is less rich in practical suggestions, such, at any rate, as would suggest themselves to our own mind. "Buy up the old companies" is the theme of the argument. For what good? If this is to constitute the whole reformation of London's water supply, then the reformation will assuredly be in name only. For my own part, I believe that the London Water Companies have done all they can do, on their own lines, and as well, or better, than other companies could have managed. I fail to see where the County Council would improve on the old lines, and believe that until the Council comes forward with a bolder scheme, and one more evidently likely to constitute a change for the better, the London public will at heart hold a similar view.

Sir Matthew White Ridley, chairman of the recent Select Committee that considered the question of various Water Bills affecting London, was occupied one day towards the end of last week with a novel ceremonial at Blackpool. Blackpool was *en fête* on Friday, on the occasion of the laying of the foundation stone of the "Eiffel" Tower, wherewith the "Blackpudlians" are to gratify themselves and astonish their visitors. The ceremony was duly performed by Sir Matthew as member for the Blackpool Division, amid general rejoicings, a procession, and subsequent banquet. But as the justices in sessions assembled have refused a license to the building, I fear the growth heavenward of Messrs. Maxwell and Tuke's ambitious scheme may be checked for a season. One may "call 'spirits' from the vasty deep" or the entrance to the lift, "but will they come?" Ay, there's the rub. If the Blackpudlians and their towrow visitors call in vain for spirits, a steel tower, be it 500ft. in height, will have no attractions.

St. Alban's Church, Teddington, is to be the largest parish church in the diocese of London. Already, it is said, the church has cost £30,000, and a lady having given money towards the cost of further works, I read that the completion of the building will leave it the pre-eminence stated above. This for statistically-minded readers.

Last Saturday saw the reconsecration of the parish church of St. Mary, Stoke Newington, which has been restored at a cost of over a thousand pounds. The Bishop of Bedford, in performing the ceremonial, congratulated the rector and congregation of St. Mary's upon a thorough restoration being effected, while the old and distinctive features of the church had been retained. It would be well if this could be said on every occasion of reopening restored churches.

I was rather surprised to learn that there were only thirteen competitors in the Cork Court-house Competition; but even in respect of numbers responding to advertisements, the vagaries of the competition world are strange and unaccountable. Perhaps the fact of the competition being for a building in Ireland may account for something—not that there is any objection to an Irish competition *per se*; but I suppose one naturally feels to have more chance the nearer one is to the place where the building is required. Otherwise this competition promised well, and there were liberal premiums offered. Then, perhaps, the building itself did not appear attractive to the average competing architect, who will have his little likes and dislikes. Some kind of competitions are no more attractive to the architect than a grub to the fish fond of flies; into others competitors are drawn like wasps into judiciously-filled lemonade bottles, and had I the mood on me, an audience powerless to escape the infliction, and a well-filled churchwarden pipe, I might, peradventure, moralise thereon to some extent.

To-night the president and committee of the Architectural Association will be glad to see any member who should be passing the Westminster Town Hall about eight o'clock, and happen to have his dress clothes in his waistcoat pocket.

GOTH.

CHIPS.

The Free Methodist chapel report just circulated shows seventeen chapels built during the year at a cost of over £21,000, and five schools at a cost of £9,366. In addition 92 chapels were enlarged or improved at a cost of £15,542.

Miss Marjory Shanks Schaw, of Park-circus, Glasgow, has offered £40,000 for the purpose of erecting and endowing a convalescent home in connection with the Glasgow Royal Infirmary, which will be erected at Bearsden.

On Saturday the Bishop of Salford laid the memorial stone of the new sanctuary in connection with the Church of St. Mary of the Immaculate Conception, Failsworth. The contract for the new building has been let for £1,240.

The vicar and churchwardens of Teddington have accepted an offer of £1,000 from a lady towards the building fund of the parish church of St. Alban. St. Alban's Church has already cost £30,000, and when completed will, it is said, be the largest parish church in the diocese of London.

The Archbishop of York visited Malton on Monday, and conducted a Benediction Service in connection with three memorial windows which have just been placed in the Priory Church at Old Malton, by members of the Kinnear family, in memory of deceased relatives. They were designed by Mr. Temple Moore, of London.

A monument is to be erected to Luther at Eisenach, and will be unveiled in 1893. Among the contributors to the memorial is the German Emperor.

The annual excursion of the Hawick Archæological Society took place on Saturday, when a company numbering 170 enjoyed a trip to Hexham and Chollerford. At the former town the party were conducted through the venerable abbey by Mr. Alexander D. Murray, who read a paper on "Hexham and Hexham Abbey." He denied that Hexham had been an important Roman station, supporting the theory that the inscribed and sculptured Roman stones had been obtained from the Roman station at Corbridge. At Chollerford the visitors were conducted over the extensive Roman station, which had been excavated by the late proprietors. Further excavations are being made by Mr. Clayton. The camp covers an area of 5¼ acres, and the walls are 5ft. thick.

This year being the 21st anniversary of the Liverpool Autumn Exhibition, Mr. Charles W. Jones has purchased and presented to the permanent collection the picture of "The Founder of English Astronomy," Jeremiah Horrocks, by Eyre Crowe, A.R.A., as a coming of age gift. The picture was a prominent feature in Gallery VI. at the recent Academy exhibition, and now finds an appropriate home in Lancashire.

The schools attached to the parish church of St. Helen's, Lancs., were reopened on Monday after extensive alterations. The work has cost about £700, and has been carried out by Mr. Rotheram, contractor, Boundary-road, Liverpool.

About twenty members of the York Architectural Association were conveyed last week by steam launch to Thorpe Head, and walked thence to Whixley. They were received at the church by the vicar, who conducted them over the edifice. The church is for the most part in the Early Decorated style, but traces of Norman work are to be found in the chancel. The fabric underwent restoration during the years 1860-2.

ROAD MAINTENANCE.*

By R. H. Dorman, County Surveyor, Armagh, Ireland.

(*Concluded from page 452.*)

THE cross section of a road should vary with its hardness and with its longitudinal slope. On level roads 1 in 24 is a suitable transverse slope where limestone or gravel are the materials used, 1 in 30 for slatestone, and 1 in 36 for hard whinstone roads. On hills the camber should be increased—for instance, on an incline of 1 in 30 with transverse slope of 1 in 30, if the surface is perfectly smooth, the water will flow off the road into the side channels at an angle of 45°; but as all roads tend to become tracked longitudinally, I would recommend the transverse slope on hills being made greater than the longitudinal slope. For the cross section of a road I prefer a flat elliptical curve for three-fourths of the width, and the shoulders well filled out. Roads constructed over peat bogs are very liable to get out of shape, owing either to the movement of the bog, to one or both sides being cut away, or to the traffic; in the latter case, owing to the bulk of the traffic passing over the middle of the road, the centre becomes depressed, and the sides rise; no remedy appears to have been found yet to prevent this distortion of bog roads. In many counties the cutting down of bog ramparts is an important item of expense. It is very difficult to prevent persons cutting turf right into the travelling way of bog roads, sometimes the turf is cut away to a depth of 20ft. below the road surface, and of course when this is done the rampart commences to split longitudinally, and rapidly goes to pieces, necessitating the whole being cut down. In carrying out such work, the metalling having been put on one side, the top of the peat, say for 2ft. in depth, should also be kept, and as soon as the rampart has been cut down, the top peat being dry and fibrous should be placed on the newly-cut surface; over this should be spread a thick layer of whins, and over this again a layer of clay or loamy gravel at least 6in. thick; after allowing a little time for this to consolidate, the broken stone may be spread off and blinded with sand or fine gravel; this description of work should always be carried out during the summer months. In making new roads over bogs the method usually adopted is to cut deep drains on each side of the proposed roadway and some 10ft. back from the line of fences, the stuff taken out being spread over floor of proposed roadway; small transverse cuts are also made at frequent intervals and field pipes laid down and covered over. When the bog has been well drained, it should be brought to a fair level and covered with layers of sods until formation surface of proposed roadway is at least 2ft. over flood level; on this surface should be spread a layer of whins, then a coating of clay or loamy gravel 9in. thick, and when this has consolidated the top metal can be spread off. I consider it useless to put a pitched foundation in a bog road, as the stones lose their position in a short time, and either rise to the surface or get lost in the bog. Narrow by-roads, termed "loanings" in the County Armagh, allowing only room for one cart, are difficult to maintain in good order. I usually have a portion of these roads, about one-tenth, sheeted each year, and repairs effected by filling in the wheel tracks, but the method is unsatisfactory. On hills the difficulty is intensified; there is no room for water tables, and very often the land on either side is higher than the road, so that all surface water, unless covered drains are put in, has to flow over the hills, probably for some distance, before it can find an outlet. Even on a hilly road 12 to 14ft. in width, farmers object to water tables being formed, on the ground that they cannot work their horses across the roads with a load; they want a road flat in cross section going up, while going down they want a channel to put one of the cart-wheels into. Country foot-paths are usually 4ft. 6in. to 6ft. in width. In the County Armagh, chisel-dressed granite (Newry and Bessbrook) and limestone, also roughly-squared stones, rough stones and sods, are used for kerbing. The dressed stone is specified 12in. by 6in. when laid flat, and 5in. by 10in. when laid on edge. The cost of completing a footpath with this class of kerbing comes to 3s. 6d. or 4s. per lineal yard, a channel of cobble stones 15in. wide costing 6d. a yard extra. The Newry or Bessbrook granite makes excellent kerbing, laid either flat or on edge; the limestone is better laid on edge, as it wears very smooth on top. A sod footpath costs from 1s. to 1s. 9d. yer yard, and with a squared limestone kerbing, 2s. 9d. per yard. Undressed stones I have ceased to use. For a new footpath the filling is composed of good hard material, over this is spread a layer of clean broken stone, and on this 2in. of gravel, or granite, whinstone, or limestone chippings; the gravel used should be of medium size and free from earth; if it does not bind quickly, it can be blinded afterwards with a little clean sand. The granite, whinstone, or limestone chippings from a machine, make excellent material when screened, but when the fine residuum is left in, the surface wears quickly and becomes very dirty in damp weather. Stone pavements consist of squared setts laid on a suitable foundation, the foundation usually consists of gravel, broken stone, or concrete of various thicknesses; this latter is the only reliable material, it should never be laid less than 6in. thick, while 9in. will carry the heaviest traffic. Portland cement and Thames ballast in the proportion of one to seven make excellent concrete. As the concrete is laid in the trench the top surface should be brought to the proper camber with the shovel. In Dublin I recently noticed the concrete was lightly rammed; while in India I was taught to have concrete thoroughly rammed until the lime or cement creamed to the surface; but this appears to be unnecessary and even injurious proceeding, particularly when a good cement is used. Granites of various qualities, whinstone, and occasionally sandstone are employed. For ordinary traffic Aberdeen or Newry granites are largely used. For very heavy traffic it is advisable to use greenstone or a hard granite; owing to the extreme hardness, of greenstone, it is very difficult to dress, and in consequence the neatest-looking pavements can be made with granite setts. Asphalte, an asphaltic mixture, and wood have been suggested as materials for packing, but they are seldom used, owing to the expense; sand and gravel are commonly used. When the foundation consists of broken stone or similar material, gravel is probably the best packing material, but it is not suitable for use on a concrete foundation; it is far easier to bed a stone on sand packing than on gravel, and when well rammed it will take an even bearing, but a stone laid on gravel is liable to rock and work loose. Formerly it was usual to bed each stone in lime mortar, no doubt a good method, but expensive. In the North of England, Dublin, and other places the joints are first filled with clean pebbles and then run with an asphaltic mixture, after which the surface is well rammed and covered with a layer of fine gravel. In the South of England the grouting usually consists of sand and lias lime or Portland cement. As regards the comparative advantages of lias and Portland cement as a grouting, I look on lias as the best substance to use when there is a probability of the pavement having to be disturbed from time to time to relay pipes, &c. Lias should also be used when the setts are of a slippery nature; one advantage of lias grouting is that it always appears to have some setting properties. When the paving is not liable to be disturbed, I look upon Portland cement as the best grouting for Newry, Aberdeen, and similar setts; the grouting and the setts wear pretty uniformly, and the stones do not work so round on the top as when a soft grout is used. When a cement grout is used the traffic should not be allowed over the surface for three or four days after the work is completed, as if the traffic is allowed over, many of the stones will work loose, and will, of course, remain so unless fresh grouting is run in; once, however, a pavement grouted with cement becomes thoroughly set, the heaviest traffic will not disturb the stones. Finally, while admitting the superiority of the "Manchester" grout with hard setts, I have a strong predilection for cement grout for the less durable setts, when laid on level ground. The setts should be laid touching one another, each stone should be so firmly bedded on the packing that it has not to rely on its neighbour for support; the packing should average 1in. in thickness, and there should be no pebbles in it, as if a pebble gets between the concrete and a sett it cannot be rammed, and will always rock. The rammer men require careful supervision; to avoid the trouble of lifting badly laid setts they often try to get an even surface by ramming the high stones extra hard, and omitting to ram the low-lying stones or stones

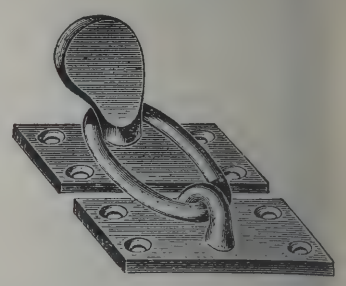
* A paper read before the Incorporated Association of Municipal and County Engineers at their meeting in Dublin, Sept. 25th and 26th, 1891.

inclined to give too much. Care should be taken when laying the pavement to see that the setts break joint. The rounding of the setts on the top is usually ascribed to the action of the wheels; but I believe it is rather due to the cogs on the horse's shoes. In conclusion, I have to express surprise that so few experiments are being made in the present day for the purpose of ascertaining the draught over different surfaces, the comparative merits of roads formed of different materials, how surfaces are affected by velocity of motion, and kindred matters; and that so little has been attempted to ascertain mathematically the resistance to rolling over different surfaces and with different velocities, the most economical means of doing work with animal power, the effects of inclinations, the development of grades, &c. I had hoped to prepare a paper dealing with these matters, but I found there were so little data to go on that a paper on these subjects would entail more labour and thought than I could afford to give in the limited time at my disposal, and I was therefore obliged to fall back on my own practical experience, and to present you with a paper which can be of little use to the older members of the Society, but which I trust may be of some assistance and interest to young surveyors.

ECCLESIASTICAL ART EXHIBITION AT RHYL.

At the Ecclesiastical Art Exhibition which is held every year concurrently with the Church Congress, the promoters have succeeded in bringing together a most interesting collection of objects in the Loan Collection. The Duke of Westminster heads the list with an old embroidered cope set as a screen. The Rev. Chancellor Espin has sent an interesting set of water-colour drawings of Chester Cathedral, taken in June, 1814, by Thomas Espin, F.S.A., of the Priory, Louth, Lincolnshire, who was one of the best architectural artists of his day, and one of the first members of the Society of Antiquaries. The drawings exhibit the cathedral from various points of view, and are executed with characteristic minuteness. When the cathedral was being restored about twenty years ago, these views were placed at the disposal of Sir Gilbert Scott, and were of much service to him as exhibiting many details which had since perished. The Rev. Dr. Preston, Trinity Vicarage, Runcorn, contributes a most valuable collection of relics and curios from Palestine, including a bronze ring used by the Crusaders, and the bones of sacrificed animals. From Egypt he sends charms from the mummies and old pottery from Heliopolis, and from Italy Roman lamps and arrow-heads found at Memphis.

Lady Harlech shows a silver chalice, having the emblem of the Passion engraved on the hexagonal foot, which was dug up some time ago in Bethnal Green, upon the property of the late Sir John Tyrrell, Bart. The Rev. T. M. Bulkeley-Owen, Tedsmore Hall, West Felton, Oswestry, contributes some fine specimens of chalices and veils, the banner of St. Chad's Mission Church, and a latten crucifix, some of which are of rare interest. Mr. J. Ignatius Williams sends some unique specimens of ancient printing from his library: Biblia Aurea Manuscripta, date 1470, the property of and apparently the work of a monk of the Order of St. Benedict; a Missale Romanum on vellum, capital letters illuminated in colours; and Liber Cronicarum ab Initio Mundi, de anno 1497. There are very beautiful sets of veils and burses—splendid example of modern work—sent by the Ven. Archdeacon Barber, of St. Mary's, Chester. Miss Powell sends a large original oil-painting of "The Salutation," or meeting of the Virgin and St. Elizabeth, with Zacharias standing near, and St. Joseph in the distance. An old chained Bible is lent by the Rev. Owen A. Nares, of Kerry, Newtown, Montgomeryshire. Mr. Franks again shows his collection of monumental rubbings, and the East Grinstead School send specimens of their embroidery. The Rev. L. R. Hughes, of Portmadoc, sends a very old silver chalice, with a silver lid; and among the collection from the Ven. Archdeacon Thomas, Meifod, Montgomeryshire, will be noticed an illuminated French MS. of "The Hours," written *c.* A.D. 1400, on vellum, with a copy of an Indulgence at the end granted by Pope John XXII. (1316-34). From the rector and churchwardens of Bodfari, Flint, comes an old silver chalice belonging to Bodfari Church, supposed by some to be of the time of Henry VII. A very quaint exhibit is that of the Rev. J. Davies, Vicar of Llanynys, Denbigh, consisting of "dog tongs," formerly used for expelling dogs from churches.



THE ARCHITECTURAL ASSOCIATION "BROWN BOOK."

The fifty-fifth session of the Architectural Association will be inaugurated this (Friday) evening by a conversazione to be given by the President and Committee at Westminster Town Hall, and concurrently with the invitation tickets to that gathering the familiar "Brown Book," the official kalendar of the Association, is issued this week to members. The new curriculum and the syllabuses of lectures, classes, and studio arrangements are the first and most important features of this annual, and deserve the attentive study of all architectural pupils and students. The Committee, in their report, commence with a reference to the fact that a new constitution and by-laws having been adopted by the Association, some steps have been taken during the session to carry into effect the New Scheme of Education. At the ordinary meetings of the session papers were read by Messrs. A. B. Pite, W. J. N. Millard, Needham Wilson, O. Fleming, J. L. Robinson, W. H. White, J. A. Powell, T. Stirling Lee, T. W. Pomeroy, W. S. Frith, J. M. Brydon, T. R. Spence, Gerald Horsley, Basil Champneys, H. V. Lanchester, H. Townsend, Percy D. Smith, Scott Morton, and Ernest Newton—all of which, it may be mentioned, were reported at the time of delivery in our columns. In the Elementary Division, lectures on the History of Architecture were again delivered—six on Classic and Renaissance Architecture, by Mr. Hugh Stannus, and six on English Renaissance, by Mr. F. R. Farrow; the number of students who attended the course was larger than in the previous session. The lectures on Construction were again delivered by Mr. E. C. Pinks. The class reports tell of a falling of numbers in both sections of that of Design and in that of Construction, and of an increase in that for the Study of Ornament and Colour Decoration. In the Advanced Division, lectures on Quantity Surveying and Specification Writing were given by Mr. J. E. Drower, and the number of attendances shows a considerable augmentation on last session. All the advanced classes announce an increase in numbers except that of Ornament and Colour Decoration, where, however, "the quality of the work has much improved." In consequence of the departure of Mr. F. W. Quick, the lecturer on Theoretical and Applied Mechanics and of Graphic Statics, for Australia, no reports are presented in those sections. The library has not been used so much as in past years, so that next session it will be opened in the day time also. The committee announce with regret that the Architectural Associations of Birmingham and Glasgow have terminated their affiliation with the London Association. The financial condition of the Association is spoken of as "fairly satisfactory," the financial year closing with a balance in favour of the Association of a shilling less than £650. The list of membership contains 1,137 names—a very small increase on last year's roll, which was 1,129; but still the highest number yet attained in the history of the Association. The syllabus of meetings for the session is as follows:—

Oct. 2, 1891. Opening Conversazione.
Oct. 16. Annual General Meeting. Address by the President, F. T. Baggallay.
Oct. 30. "Pitfalls on Commencing Practice," W. H. Bidlake.
Nov. 13. "Frame Houses," C H. Brodie.
Nov 27. "Concerning John D. Sedding: his Work and Influence," H. Wilson.
Dec. 11. "Some Suggestions for the Practical Education of an Architect," T. G. Jackson.
Jan. 15, 1892. "The Design and Equipment of Technical Schools and Colleges," Professor Garnet.
Jan. 29. "Fashion in Architecture and Art, with remarks on its Effect on Mural Painting and Painted Glass," N. H. J. Westlake.
Feb. 5. "Suggestive Domestic Work Seen in Past A. A. Excursions" (with lantern illustrations), Maurice B. Adams.
Feb. 19. "Domestic Electric Lighting," Max Clarke.
March 4. "How They Built in Shakespeare's Time" (with lantern illustrations), J. Alfred Gotch.
March 18. "The Planning of Theatres," E. A. E. Woodrow.
April 1. Subject of paper to be announced.
April 22. Members' soirée.
May 13. Subject of paper to be announced. Nomination of officers.
May 27. "The Travelling Student's Notes," Kotaro Sakurai. Election of officers.
May 31. Annual dinner.

PICCAVER'S PATENT SASH FASTE

This invention provides in a simple fo really reliable and strong fastener, dra the sashes together, and preventing all shal It is specified for the buildings being erecte

the Guinness Trust Commissioners, and is invention of Mr. J. A. Piccaver, architect, Newland-chambers, Northampton. The l plate is fixed on the lower sash, and the thu bit on the upper sash, so that when closed the touches the neck of the thumb-bit, in same p tion as shown in the sketch. The fasteni perfectly burglar-proof, and there is no fe the sashes sticking. It is reasonable in price, ought to find favour.

COUNTY COUNCILS AND TECHNI EDUCATION.

The Guild and School of Handicraft, E House, Mile End-road, London, E. view of the recent action of the County Cou schools, and other corporate bodies in the m of technical education, and also of the n demands received by them from various quar the governing body of the Guild and Scho Handicraft have decided to offer the follo suggestions to the counties for carrying out of the objects required;—

1. The Guild and School of Handicraft is r to prepare schemes for the organisation of manual training in any county, in any dis (urban or agricultural), or in any schoo institution.

2. Also to send, in conformity with schemes, fully competent and qualified crafts of the highest skill as instructors in the elem tary handling of different materials—such wood, metal, clay, &c., in such lines of wor carpentry, joinery, wrought and hammered w carving, modelling, also mechanical draw designing, &c., the instructors being men themselves artisans, are likewise well conver with the educational curriculum of the Scho Handicraft.

3. Also, where it is sought to develop training, by means of local men, to send, a spectors from London, men of practical skill, at the same time, of educational experience examine and report upon the training give country and other schools and workshops.

4. Also to advise as to the planning or erec of any school buildings, and to superintend erection of the same.

5. Also to supply and fix all necessary pl tools, and equipments.

6. Also to supply, or to advise as to the se tion and circulation of, any works of handic replicas, casts, working models for prac lessons, diagrams, photographs, designs, &c conformity with the wants in special cases.

7. Inasmuch as the work in the Schoo Handicraft has, during the last three years, found to be most successfully furthered by instruction given by the artisans of the Gui masters and teachers of elementary schoo London, some eighty of these masters bein present on its books, special attention wi paid by the Guild and School to this branc the work in any scheme or system of teac drawn up by it for school or county; it b the masters of elementary schools who have training of the artisans of the future in hands.

A detailed draft or manual will be is shortly which contains information and advi to the above subjects, and which may be obta on application to the secretary of the Gui Handicraft, Mr. Frank Prout, Essex Ho Mile End-road, E.

This draft, together with any others of a special nature, is issued with the approval o

e educational committee of the Guild and f Handicraft, the functions of this com- being educational and consultative only. eme, if accepted by county, borough, or nay—at the option of those for whom it red, and with any modifications by them vise—be placed into the hands of the f Handicraft to be carried out into prac- rking.

CHIPS.

. G. Jones, of Oswestry, has been appointed and sanitary inspector to the Potterspury nitary authority.

e hotel to be known as Bruce's is about to on the Links at Carnoustie, N.B. Mr. raser, of Carnoustie, is the architect.

s been decided by the Liverpool Library and Arts Committee to hold, in the Art Gallery in that city, next spring, an on of naval and nautical pictures, models, ics.

Dove Wilcox introduced, on Friday, at a of the Bristol Chamber of Commerce, a devised by Messrs. Trew, of that city, ts, for connecting Kingswood, St. George, nham with the Midland and Great Western y systems. The matter was referred to a tee of the chamber for consideration.

pening of the new police-courts and offices l-road, Bootle, will take place on Thursday on, October 22. The buildings are Classic , and have cost about £10,000. Mr. C. J. on, of Dale-street, Liverpool, is the archi- d the contractors are Messrs. George Woods n, of Bootle.

Saturday afternoon, the foundation-stone of a resbyterian church and school, to be called ll Memorial, was laid at Bedlington by Sir B. Bruce. The cost is to be £1,700. It is eometrical in style, built of local red brick, one dressings and firebrick bands. The roof be covered with Welsh slates, with green oreland bands. The whole of the joiner s to be executed in pitch-pine. There will ommodation in the church for 300 people, the schools for 200 children. The architect Neil Macnara, of Rumbling Bridge, Stirling, e contractors are Messrs. Brown Brothers,

Tuesday week the chairman of the Romford of guardians laid the memorial-stone of the ary in course of erection on land adjoining nion-house. The infirmary will consist of a l block of two floors with a wing on each side. floor will accommodate 28 beds. The prin- vards and lavatories will be lined with glazed , the floors will be fireproof, and there will be roof staircase to the verandah for use in case . In addition to the erection of the infirmary, erable additions are being made to the union- , including a dining-hall, to seat 350 persons, kitchen, and a new boiler-house and water- . The architect is Mr. F. Whitmore, of sford, and the work is being carried out by s. J. S. Hammond and Son, of Romford.

bridge collapsed on Friday on the North h Railway on the Waverley route opposite , and about two miles north of Galashiels. It single iron girder bridge without piers, rest- an abutment at each side. The flood of the us Monday had undermined the abutment on uth side, and on Friday half of the bridge fell aving the down-line rails suspended, and held nation by its grapplings with the other line of

foundation stone of the "Eiffel" tower for pool was laid on Friday. The buildings will ected from designs by Messrs. Maxwell and , of Manchester, whose design, selected in stition, was illustrated in the BUILDING NEWS 3rd July last. The buildings occupy a site of square yards, lying on the front and mid-way en the two piers. The space surrounding the will be occupied by a series of buildings, ling a circus, a market and arcade, shops, rant, a promenade, and concert-room. The will be of steel, carried to a height of nearly ., the principal gallery being at an elevation 0ft. from the ground, and forming an inclosure square. Above this will be a series of three galleries varying from 30ft. to 14ft. square, he whole will be crowned by a crow's nest 5ft. meter.

der the title of John Fell (Limited) a company een registered, with a capital of £100,000, in hares, to carry on the business of a builder ontractor for public works, and of a worker lealer in timber and metals, and of a brick and aker, and dealer in fireclay and other mine- and to carry on the business of a farmer and -dealer, shipowner, contractor for railways ramways, &c.

Building Intelligence.

ABERDEEN.—The plans of two new public buildings were sanctioned by the plans committee of the town council on Friday. The first plans were those of Mann's Hotel, in Union-terrace, the architects being Messrs. Matthews and Mackenzie. The hotel will have a frontage of 81ft., and be four stories in height, with attics and basement floors. The estimated cost is £10,000. The other building is a chapel for the Sisters of St. Margaret's of Scotland, to be erected on the west side of Spittal, and measuring 64ft. in length, 18ft. in width, and 36ft. in height. Messrs. Bucknell and Cowper, London, are the architects, and the estimated cost is £2,000.

ALDERSHOT.—The important alterations at Aldershot Camp, to be effected by means of the sum of nearly £1,500,000 granted by the Barracks Act, are now rapidly advancing towards completion, and will, in a few months, take the place of the old wooden huts, in use since the Crimean War. The scheme of reconstruction not only provides better accommodation, but contemplates a great increase in the number of the troops. Sixteen instead of nine battalions will constitute the infantry establishments, and fourteen of these will be housed either in the new barrack buildings or in brick huts. The remaining two battalions will be quartered eight miles off, in the buildings formerly known as Woking Convict Prison. The strength of other branches of the Army is to be proportionately increased. The site for the headquarter offices has been chosen. Schemes of electric lighting and for unlimited supply of water by artesian wells are now under consideration by the engineer authorities

ASTON.—The foundation stones of new public baths for Aston, Birmingham, were laid on Wednesday week. The buildings are situate in Victoria-road, and will be Classical Renaissance in character, the frontage being of bright red terracotta. Immediately entered from the central porch, there will be eight private baths for ladies on either side of the entrance. Inside the first-class entrance will be five private baths, and a staircase at one side will lead to the committee room, situate in the main frontage. From the other side of the entrance the first-class swimming bath will be approached. This will be 78ft. by 39ft., and the depth will vary from 3ft. 6in. to 6ft. 6in. The superficial water area of the bath, which will be lined with white glazed brick, will be 3,042ft. Forty-three dressing-rooms, divided by brick partitions, will be provided here, together with a hot-room, and a promenade gallery, holding 500 persons, will run round three sides of the bath. The building materials are pressed red brick relieved by bands of buff brick and a dado of glazed white brick finished with coloured stringcourses. At the other end of the building will be the second-class swimming bath, similar in design to the first-class bath, but measuring only 60ft. by 33ft., and having a superficial water area of 1,980ft. There will be 59 dressing boxes here, and a special feature of this section will be a soap plunge bath. The engine-house and laundry will be at the rear of the second-class baths, and the caretaker's residence will front on Albert-road. The engine and pumps are being supplied by Messrs. Piercy and Son, Broad-street, Birmingham. The contract for the hot and cold water supply pipes, steam pipes, and heating work has been given to the Griffin Fountry Co., Birmingham. The work will cost about £12,000. The drawings and specification have been prepared by Mr. W. Augustus Davies, A.M.I.C.E., engineer and surveyor to the Aston Manor Local Board, and the work is being carried out under his direction. Mr. J. H. Smith is clerk of the works, and the contractor for the same is Mr. F. N. Stephens, of Aston. The terracotta is being supplied by Mr. Edwards, of Ruabon, who also supplied the terracotta for the front of the recently completed Birmingham Law Courts.

BARNINGHAM.—The parish church of Barningham, near Barnard Castle, was reopened by the Bishop of Ripon last Saturday, after having undergone a complete transformation under the hands of Mr. J. P. Pritchett, architect, of Darlington. The scheme as carried out comprises new traceried windows, the erection of an arcade on either side of the nave, reducing the width and forming narrow aisles, erecting a chancel arch about 10ft. further west than the old one, so as to lengthen the chancel by so much, and at the same time reducing its width by building thin walls inside, forming vestries on each side as chancel aisles. The flat ceiling was removed, and by cutting out the central parts of the tie-beams, open hammerbeam roofs with curved braces were formed without disturbing the rafters or slates. New fittings were furnished throughout the church, those in the chancel being of Austrian oak and in the nave of yellow pine. The work has been carried out under the superintendence of Mr. Pritchett and his son, Mr. H. D. Pritchett, Mr. Dodds being clerk of works. The total cost was £1,500.

BELVEDERE.—The old oaken pulpit in Belvedere parish church has been replaced by one of stone and marble, placed there as a memorial to the late Rev. J. H. Bernau. The new one is made entirely of Beer stone. It is octagonal on plan, and is of Early English character. The rostrum itself is moulded. On the four cants are circular and recessed panels, in which are carved, in high relief, the symbols of the different Evangelists, as recorded in Holy Writ by Ezekiel and St. John. The pulpit is surmounted by a polished English alabaster cornice. The work has been carried out from designs by Mr. Edward Hide, New City Chambers, Bishopsgate-street, E.C., by Mr. Harry Hems, of Exeter.

LONDON COUNTY COUNCIL.—At the meeting of this body on Tuesday a report was submitted by the Improvements Committee stating that they had come to the conclusion that the most pressing street improvements were (1) Sandys-row to Bishopsgate, (2) Boziers-court, Tottenham Court-road, (3) the widening of the Strand at Holywell-street, and (4) the widening of Nine Elms-lane, Battersea. They recommended that the Council apply in the next Session of Parliament for powers to carry out those improvements. The committee added that they particularly regretted being obliged to contemplate the postponement of the proposed new street from Holborn to the Strand, as they felt it was one of those improvements which should be undertaken at the earliest possible moment which the Council's finances would admit of. After a long discussion on the incidence of taxation, in which it was urged that the ground landlords ought to bear a proportion of the burden, the proposal as to Sandys-row, estimated to cost nearly £90,000, was agreed to, consideration of the three other schemes being adjourned. The following loans to local authorities were agreed to:—The Vestry of Lambeth, £20,000 for jarrah-wood paving works in the Kennington Park-road and Brixton-road; the St. Saviour's District Board, £1,600 for wood paving in Borough High-street; the Vestry of St. Margaret and St. John, Westminster, £10,300 for asphalte and wood paving works; the guardians of Fulham, £26,000 to defray the cost of the enlargement of their workhouse; the guardians of St. George's-in-the-East, £6,200 to purchase a freehold site and erect a laundry; and the commissioners of baths for St. Margaret and St. John's, Westminster, £7,000 to purchase a freehold site and erect a library.

LEIGHTON BUZZARD.—Memorial stones have been laid of a new Baptist Chapel for the congregation worshipping at the Hockliffe-road chapel. The new building will be of red brick, with Bath-stone facings. The front, of black-pointed red brick, with stone facings, will have a central door, and two side entrances to the galleries. The size of the chapel will be 67ft. by 40ft. The vestries are in the rear, and the schoolroom, also at the back, measures 45ft. by 26ft., with ten classrooms at the sides, 8ft. square, and infants' classroom behind, 25ft. by 15ft. The estimated cost is £3,300. The architect is Mr. Hampden W. Pratt, of 6, Duke-street, Adelphi, London; and the builder Mr. Garside, of Leighton Buzzard.

NEWCASTLE-ON-TYNE.—The banking premises in Collingwood-street were formally opened on Monday. The bank is in the Italian style, and has a frontage of about 100ft., with a height of 54ft. The architect is Mr. R. J. Johnson, F.S.A., of Newcastle and York; the contract has been carried out by Mr. Walter Scott, of Newcastle; and the clerk of the works is Mr. W. R. Bennett. The principal entrance is in the centre, through a door-case of red granite. All the rest of the front, except the plinth, which is also of granite, is of Gunnerton freestone. Internally the basement is occupied by the safes and strong rooms, which are arched with brick. In the

centre of all is the bullion safe, lined with steel alike as to walls, floor, and roof. Lavatories for clerks, chambers for heating, and so forth, are also arranged on this floor. The banking room and partners' room, with two waiting-rooms, occupy all the ground floor except the space required for staircases. The principal rooms, which are large and lofty, are fitted up in the same style as the building, the banking room being panelled round with oak for about 6ft. in height. All the counters and desks are designed to correspond. The partners' room is fitted up in mahogany. There is a hydraulic lift for raising and lowering the books to the basement.

Rhyl.—In anticipation of the meeting of the Church Congress, the chancel of St. Thomas's church has been enriched by the addition of a new reredos, the gift of Mr. R. Bamford Hesketh, of Gwrych Castle, Abergele. The architectural framework and surroundings are of polished, veined alabaster, and all the sculpture of white alabaster, the super-altar of solid Devonshire marble. The central feature is a group of the Crucifixion, and in the panelling on each side, divided by pinnacled buttresses, are angels kneeling in attitudes of devotion; a carved and embattled cornice of unequal elevation surmounts the whole. Extending from the reredos on each side, filling up the space on east wall, and continuing along the north and south sides 18ft., is an arcading of Caen stone, supported by marble columns, the divisions being filled with a diaper of embossed terracotta tiles. The whole has been executed by Messrs. Earp and Hobbs, of London and Manchester.

CHIPS.

The total cost of the Eiffel Tower is officially stated to have been 7,457,000 francs (£298,280).

Dr. Butt, Bishop of Southwark, on Saturday, laid in Mint-street, Borough, the first stone of a Roman Catholic Church, to be called "The Church of the Precious Blood." The building, of red brick, and accommodating about eight hundred worshippers, will be planned on the lines of some of the older churches of Rome. Entrance will be gained by descending several steps through a deep porch. There will be no aisles. The cost is to be £7,000.

Messrs. Bridgman and Goss, of the Poultry, have prepared plans for the Murphy Memorial Hall, to be reared on the site of Borough-road Church to perpetuate the life-work of the late G. M. Murphy. It is intended to have one large hall with gallery to seat 1,000 persons, with a lesser hall and six class or committee rooms, at an expenditure of about £6,500.

Mr. Thornhill Harrison, M.I.C.E., an inspector of the Local Government Board, held an inquiry at Wimbledon on Thursday in last week, concerning the Local Board's application for sanction to borrow £6,000 for widening Wimbledon-hill, and £200 for making up Cochrane-road. Mr. Whitfield, clerk to the board, said the land would be £2,500, and the work would cost £3,082, besides which there was required 10 per cent. for contingencies, and £50 for costs. The scheme was for the much-needed widening of the hill and of High-street. Provision was made for preserving as many as possible of the trees which formed a great ornament to the hill. The hill would be made a uniform width of 70ft., and High-street 50ft. No opposition was offered to the application.

The ceremony of consecrating Holy Trinity Episcopal Church, Dunfermline, took place last week. The church, which is situated in Viewfield-place, has been built by design from Dr. Rowand Anderson, Edinburgh, and is in the Fifteenth Century style. It consists of a nave and chancel, with vestry and organ chamber. Accommodation is provided for more than 200 worshippers, and provision is made for adding a transept on the south side. The roofs are of iron.

The Bishop of Colchester will open to-morrow (Saturday) a mission hall at Burnt Mill, in Essex. It is cruciform in plan, and has cost about £500, the material used being red bricks and tiles, with timber and brick-nogged gables and porch. The windows are fitted with rough green cathedral glass, and the roof is covered with Broseley tiles. It has been erected from the designs and under the superintendence of Mr. Leonard Martin, of the firm of Treadwell and Martin, of Waterloo-place, S.W. The builders were Messrs. French and Ellwood, of Westminster.

The death is announced of the great Danish numismatist, C. L. Müller. He was the Keeper of the Royal Collection of Coins and Medals, and the Inspector of Thorvaldsen's Museum at Copenhagen. He had written many works on ancient coins.

COMPETITIONS.

Shrewsbury Public Baths.—A special meeting of the town council was held on Monday, when the competitive plans for the new public baths were submitted. The Baths Committee recommended that the design sent in by "Plan" be accepted by the council as the most suitable, and that the design of "Naiad" receive the second premium. The committee's report was adopted, and on opening the sealed envelopes it was found that the author of the successful design is Mr. J. Johnson, Queen Victoria-street, London, and the second is Messrs. Horton and Co.'s, Wednesbury. The premiums are £50 and £20 respectively.

Kendal.—Messrs. Leeming and Leeming, the assessors appointed in the competition announced by the borough of Kendal for proposed additions and alterations to the Town Hall Municipal Buildings, have recommended the following award: — 1st, "Adaptability," Mr. Stephen Shaw, F.R.I.B.A., of Kendal; 2nd, "Truth," Messrs. Woodhouse and Willoughby, of Manchester; 3rd, "Fides et Justitia," Mr. J. A. Macgregor, of Dumfries.

Lambeth. — Mr. A. Hessell Tiltman, F.R.I.B.A., of 70, Torrington-square, W.C., has received an official notification from the clerk to the Commissioners of Baths and Washhouses for Lambeth, that, upon the recommendation of their arbitrator (Mr. Henry Currey), the first premium had been awarded to him by the commissioners for his design submitted in competition for their new Westminster Bridge-road establishment. This is the third consecutive competition Mr. Tiltman has won in twelve months for three sets of baths and washhouses, and in each case a different arbitrator was employed.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Bristol Master Builders' Association.—At a meeting of the committee of this association held last week, the following resolution was adopted: "That this committee is of opinion that the Electrical Lighting Committee, in passing over the lowest tender for their new station and accepting a higher one, have committed an act of great injustice both to the contractor, whom they have ignored, and the ratepayers, and that the lowest tender should always be accepted, unless good and sufficient reason is shown to the contrary, which this committee considers does not exist in this case." In addition to the prizes adjudicated in the practical work at the Merchant Venturers' Schools on the plumbing class, the following have been awarded the Master Builders' prizes for theoretical work and attendance: First prize to Charles J. Webber, second to Percy N. Biggs, and the third to H. J. H. Russell.

Waterlow Park, Highgate-hill, was thrown open freely to the public on Tuesday last.

The late Mr. Walter Kidman Foster, formerly of Threadneedle-street, banker, and late of Leinster-gardens, Hyde Park, who left personal estate amounting to £82,000, has bequeathed to the University of Cambridge his collection of antiquities, to be deposited in their Archæological Museum, on condition that the prehistoric and Anglo-Saxon portions are kept and exhibited together, and designated "The Walter K. Foster Bequest"; he also bequeaths £100 for the purchase of a case or cases for the exhibition of the said antiquities, and such of the antiquarian works in his library as may be selected.

Sir John Fowler, writing upon the jubilee of the London, Brighton, and South Coast Railway, mentions that the original engineer of that system was the late Mr. Rostrick, who not only carried out the main line to Brighton, but the lines of the system now known as the London, Brighton, and South Coast Railway, extending to Lewes, Hastings, Portsmouth, Horsham, Newhaven, and other places. As a very young engineer at the time, Sir John Fowler was Mr. Rostrick's principal assistant, and testifies that no other engineer was associated with Mr. Rostrick in the construction, although Sir John Rennie was associated with him in obtaining the Act.

A new turret clock has been erected in the new tower of the parish church at Lymm. Messrs. Wm. Potts and Sons, of Leeds, are the makers. The clock is constructed from the designs of Lord Grimthorpe. It has the double three-legged gravity escapement compensation pendulum, and all the latest improvements, and will be one of the best timekeepers.

THE A.A. LECTURE FEES.

To the Editor of the Building New

Sir,—I have before me the notice sen
the A.A. for the coming sessional lect
students; but it strikes me that the
£10 10s. for the course will operate ag
success, which all should desire, as I ta
be the intention of the committee to e
great a number as possible, and for this
I think a payment of £5 5s. would ha
crowned with better results. No doubt
were arranged so as not "to compete
University College course of £11 11s."
views also on this are the same, for the
that premiums have to be paid on enterin
articles.—I am, &c.,

Anxious for Success of the

At the Consistory Court of the Chanc
Carlisle on Friday, an application was made
vicar of Rydal to put up a stained-glass m
window in Rydal Churchyard, in memory o
Mima and Rotha Quillinan, relatives by mar
the poet Wordsworth. The window will
work of Mr. Henry Holiday, London. The
is a study of angels with a scroll bear
inscription: "In Heaven the angels alw
behold the face of my Father." The app
was granted. The cost of the window wil
guineas.

Intercommunication.

QUESTIONS.

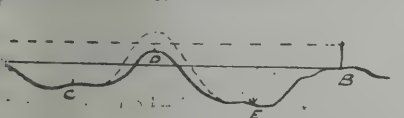
632.]—**Lift and Force Pump.**—I have had a nd force pump fixed which does not work and dis-ge as it should do. It has 2in. suction pipe and 1¼in. ery. When working it makes a chucking noise. e is a reducing socket on the barrel and two bends in :arging pipe before reaching the tank. Where is fault? Should the delivery pipe be larger? Will : of your correspondents please put me right?—IBA.

633.]—**Soil-Pipes.**—I have lately noticed many pipes of 4in. diameter being reduced to 3in. above tion with w.c., and, being carried up above ridge of they act as ventilating pipes. One of the by-laws of borough says: "If a soil-pipe be carried up to act as ntilating shaft there shall be no diminution in its ieter." Do the pipes ventilate better if reduced? ld some authority kindly explain this, and recom-i some good book on drains—not a dear one?—TOWN LS.

634.]—**Brick as a Building Material.**—I am ıding to build a house for my own occupation, and d prefer it of brick; but there is a prejudice against : houses in this district, though I cannot quite make the proper grounds for it. Will any of your erous readers say if there is any difference from a ıary point of view between a brick and stone-built e, and, if so, the reasons for such difference?—ıRAMUS, Huddersfield.

635.]—**Stone Railway Bridge.**—Given a stone of a railway bridge with two lines of rails, carrying ıch a certain rolling load per foot. In calculating ırve of equilibrium &c., in the arch, is the rolling merely added to the dead load (as the moving load the case of floors &c.)? and, if not, how is allowance e for it?—AN OLD SUBSCRIBER.

636.]—**Very Hard Impervious Floors nted.**—Will someone kindly inform me as to the t wearable kind of floor in the market for lavatories, ages, &c, in industrial buildings where there is mous and constant traffic with hob-nailed and iron-ed boots? Can any class of cement or concrete, or , or asphalte, be reckoned as fairly permanent under conditions?—S. S. S.



637.]—**Discoloured Paper.**—Will someone ly give a means of taking out the yellowish tinge ı some plans, caused by the London atmosphere.—I. EASTON.

638].—**Concrete.**—In Spon's "Architects' and ders' Pocket Book," 1883, page 42, the materials for rete (building) are described thus: "Half measure Portland cement, half measure of air-slaked lime . seven measures of sand and gravel . . . . mixed ther dry . . . . &c., &c." I have been warned not se lime and cement together. Will anyone who has experience of the ill-effects arising from same kindly the results of their experience?—PERPLEXED.

639.]—**Details.**—Will some reader kindly give me ıame of a good book treating on the details of Gothic-ried windows?—MASON.

REPLIES.

622].—**Surveying.**—Student may find the follow-ıseful:—He sets his theodolite up at point A, and : levelling it, fixes the telescope on point B. He s his man on with a long pole, and gives him points ıd D on the line A B. Owing to the dip in the ground : he cannot see the pole, and finds it necessary to shift theodolite to point D, where he sets it up again as at He can then give point E. Care must be taken to level instrument accurately, as otherwise the line will not

traight. Supposing, however, the point D should be ıer than either A or B, as shown by dotted line, then lent will have to go to point D and select a point as : as he can judge in a line with A B. He fixes the scope on point A, and then, keeping the body of the rument firmly clamped, takes the telescope out of the and reverses it in the direction of point B. Should it ither to the right or left of B (as it probably will), the rument will have to be shifted until the point is ıd at which, when the telescope is fixed on A, it , when reversed, also be in a direct line with B—that say, if the telescope is pointing to the left of B, the rument must be shifted to the right until from the ıt D the crosshairs of the telescope fix directly on ıts A and B. These lines present few difficulties with , but in town work, where houses intervene, it is uently found necessary to throw angles round build-s, &c. Space will not allow of any description of ıe; but I should advise student, if in London or some he towns in Lancashire and Yorkshire, to try and get ntroduction to some of the surveyors of the Ordnance vey engaged in surveying in these towns, where he can ain more practical instruction in the course of a day n he can possibly do from any written instruction.—H. RICE, O.S.O., Chester.

629.]—**South Kensington Exams.**—"An roduction to Gothic Architecture," by J. H. Parker. hird Grade Perspective," by H. J. Dennis (approved the Science and Art Department).—CHARLES T. HEN.

A new Wesleyan chapel at Mickleton, near esham, was opened on Wednesday week. It ts 200 persons, and cost £700. Mr. J. T. Shep-d, of Honeybourne, was the builder.

Legal.

REPAIRING COVENANTS.

IT is quite usual in the dull season of the year for the wrongs of tenants and lessees to be brought out once more in the newspapers. "The Lament of a Leaseholder" has accordingly been heard of late loudly complaining of covenants to repair. It is said that these clauses in leases become more and more stringent as time goes on. This may be true so far as internal decoration is concerned, because, if tenants will have their houses done up to such a pitch of artistic luxury before taking a lease, they must either pay the landlord an increased rent as interest upon his added outlay, or, keeping to a reasonable rent, they must be bound by strict covenant to leave the premises in the same state of artistic internal decoration, so that he may be able to get another tenant at a similar rent without having to sink more money in the property. In such matters tenants should not act for themselves, as they too often do, only to find out afterwards, when too late, what a muddle they have made of the whole business. They should consult their architect as to the probable cost of such repairs, in the same way as they see their solicitor upon the legal effect of the covenants in their lease.

It is, of course, merely a matter of bargain, and there is now nothing more harsh in the law which binds a man to carry out the clauses to which he has agreed in his lease, than there is in the same legal obligation to abide by the clauses of a deed of partnership upon the sale of a business. But it has become a stock article of faith with many that the law is all on the side of a lessor, and it seems useless to point out to them that the law simply enforces the provisions of the lease which they have themselves signed, after what should have been proper advice and full consideration. Of course, it occasionally happens that hard cases arise, as when an original lessee finds himself liable for repairs long after he has assigned over all his interest to an assignee whom he thought sound. But these risks are run in other ways without throwing the blame upon the law. It is also not uncommon for the holder of an old lease at the end of the term to find he has to pay much more than he expected in the way of repairs. But this, again, arises from his having gone into a speculation without having first consulted his surveyor.

FRED WETHERFIELD, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by Tuesday morning each week.

TENANT.—TENANCY.—By paying your rent quarterly you have become, by implication, what the law calls a "yearly tenant." There is no such thing as a "quarterly tenant" in law, except by agreement. So you must give six months' notice, expiring at the same quarter or date as that from which your holding began. A quarter's notice can only be sufficient in such cases, where it has been so agreed.

X. Y. Z.—LAND TAX.—This is *primâ facie* and legally a landlord's tax. But if a lessee or tenant agrees generally to pay "all rates and taxes," this includes land tax; because there is nothing in law to prevent such an agreement, as there is in the case of Income or Property-tax. So that these two taxes are not analogous, nor subject to the same legal rule, as you seem to suppose.

CHIPS.

The county council of Shetland have appointed Mr. Alexander Ross, of Aberdeen, as road surveyor for the county.

A stained-glass window, having as its subject the Maries at the Tomb of the Risen Lord, has been placed in the south aisle of St. John the Evangelist's Church at Bexley, Kent. Messrs. Burlison and Grylls, of London, were the artists.

Messrs. Dale, Young, Nelson, and Co. have recently opened premises for the purpose of banking in Grey-street, Newcastle-on-Tyne. The building has been constructed by Messrs. Tyrie and Graham, of Gateshead, from plans supplied by Messrs. Lamb, Armstrong, and Knowles, architects, Newcastle.

Alterations are in progress at Hagley Church, comprising the enlargement of the clergy and choir vestries and organ-chamber. The plans of Mr. Tom Grazebrook, architect, of Stourbridge and Dudley, have been approved of, and the work is now being carried out under his superintendence by Mr. W. North, builder, of Stourbridge.

LEGAL INTELLIGENCE.

IN RE R. T. ELSAM.—The statement of affairs of Richard Thomas Elsam, architect and surveyor, of 36, Market-place, Kingston-on-Thames, and residing at Westbourne Villa, Hampton Wick, estimates the gross liabilities at £859 19s. 1d., £722 4s. 1d. of which is due to unsecured creditors, and £6 7s. 6d. a creditor partly secured, giving £728 11s. 7d. to rank for dividend. After deducting preferential creditors, his net assets are set out at £518 11s. 9d. The debtor alleges the cause of his failure to be general depression in building operations during the last three or four years, and being compelled to resign his position as surveyor to the Hampton Wick local board, and their refusing to pay his professional charges.—The Official Receiver's observations set forth that the receiving order was made on the debtor's own petition. The debtor said he commenced business twenty-five years ago without capital, being from 1866 to 1874 in partnership with a Mr. Walker. In 1871 he was appointed surveyor to the local board at Hampton Wick, and this appointment he held until May, 1890. The debtor's offices in Kingston were opened in May, 1889. The only books kept have been rough diaries.

POLLUTION OF THE RIVER BLACKWATER.—CONFLICTING PROFESSIONAL EVIDENCE.—In the Farnham and Aldershot County Court on Wednesday week, the action of "Hartley Wintney Rural Sanitary Authority v. Aldershot Local Board" came before his Honour Judge Lushington. The former authority originally obtained an injunction against the local board to prevent them from polluting the river Blackwater. An application was consequently made to extend the period, in order that the local board might conform with the order made by his Honour. It was not until September 22nd, 1887, that the order was made peremptory. Counsel urged that pollution was still continuing, and that the plaintiff authority had been put to great expense in cleaning out the river, expense which the local board should be made to bear. Mr. J. R. Sisterson, surveyor to the plaintiff authority, deposed that he had taken samples of river water which contained crude sewage. Cross-examined: In 1885 the plaintiff authority spent over £700 in cleansing out the river. The river had never previously been cleaned out. The river was worse below the effluent than it was above. Mr. Whitehorn, assistant surveyor to the plaintiff authority, corroborated Mr. Sisterson. Dr. Angell, analyst for the county of Hampshire, said he had examined the samples, and generally they were dangerous effluents, and it would be dangerous to allow them to run into the stream. From the analysis he did not think the board's sewage was treated chemically, and certainly not in an efficient manner. Cross-examined: He would be very much surprised to hear that 12cwt. of lime was used daily at the board's sewage works. Further, lime by itself was not a successful treatment, and had been known to create greater nuisances than it was intended to prevent. Lime with other chemicals was much better. He was consulting chemist to the International Water and Sewage Purification Company, and advised the patentee in the matter. The company's process was by chemical precipitation combined with filtration. He knew that the local board had been in negotiation with the company in which he was interested, and of course the more that company's process was adopted the more fees he obtained. For the quantity of sewage to be dealt with by the board, 12cwt. of lime and 2cwt. of alumino ferric would be a very good process if properly carried out, but their levels were too low, and dry land was better for the purpose. He always recommended the process patented by the International Company. Counsel warmly commented upon the connection of Dr. Angell with the company. The plaintiff authority relied upon the prejudiced evidence of Dr. Angell, who was the "father" of the International Company. His Honour: You are charging the plaintiff authority with odious conduct, and you also make charges against Dr. Angell. I think you might argue the case very differently to that. For the defence, Mr. Rushford, surveyor to the defendant board, described the sewage works and the process of treatment. Cross-examined: He could not say that the International process was better than the process at present adopted until the former was tried. Professor Attfield, with 30 years' experience of the chemistry of sewage, detailed results of analysing samples sent him by the local board in 1888 and 1890. As for the analysis detailed by Dr. Angell, witness thought it was entirely impossible to meet with the quantity of solids in suspension as stated. This was an impossible analysis, not through the fault of the analyst, but because the collection had been badly performed. He looked upon the process adopted at Aldershot as satisfactory. He had met at Aldershot with "strong" sewage. Major Tulloch, chief engineering inspector of the Local Government Board, also gave evidence of the process at Aldershot, and which, he said, was carried out in a large number of towns, and was favoured by engineers. As a result of an inquiry,

however, he had withheld a certificate, because the sewage was not purified sufficiently. He was satisfied that the board were doing the best they could, and advised a different chemical process—viz., the International Company's process. His Honour said, after hearing the evidences of Major Tulloch, he thought the Local Board should have longer time; it was a difficult and expensive matter. He did not think he ought to impose penalties, but the Board must do something. Major Tulloch said a year would be necessary for the Board to try experiments, and his Honour accordingly adjourned the case for a year, and suspended the costs over that period.

In re Clark and Ward.—The creditors of Charles Wm. Clark and Ralph Collinson Ward, joiners and builders, Foss Islands, York, held their first meeting last week. Clark had, it was announced, absconded, Ward only being present. So far as could be ascertained, stated the Official Receiver, the debtors' gross liabilities totalled £4,174 18s. 2d., which included £3,200 as the value of security of creditors partly secured, leaving £500 to rank against the estate for dividend. Unsecured liabilities were put down at £975 18s. 2d. The estimated production on assets was £225 15s. 6d. after deducting creditors' wages, the deficiency remaining being £750 4s. 8d. The stock had realised a little over £200. Debtors were adjudicated bankrupts.

Claim against a Contractor.—Enoch Wyatt, farmer, Mount Boone, Dartmouth, sued R. Rowe, contractor, Dartmouth, at Churston County Court, on Sept. 21st, for £15 15s. damages for injury done in January last by defendant carting building materials across some land, and failing to repair a road in accordance with contract. There was a counterclaim for £23 damages sustained in alleged breach of contract. Plaintiff's case was that last year a racquet-court was built for the *Britannia*. A contract was entered into by the Admiralty with the defendant to do the work. Plaintiff agreed with the Admiralty to £5 compensation for cartage of materials over his land, the road to be kept in repair. Defendant neglected to repair the road, and witness locked the gates. Mr. T. O. Veale, borough surveyor of Dartmouth, called by plaintiff, said it would take from £10 to £15 to put the road in order. It was stated, for defendant, that the reason why the Admiralty declined to pay the money was that plaintiff had broken the contract by closing the gate upon defendant. Defendant was not to repair the road until after he had finished using it; but plaintiff stopped him before that. Defendant said that in consequence of plaintiff locking the gates he had to construct, at a cost of £20, a tramway through a quarry to convey the materials. Mr. E. H. Back, surveyor, said £2 or £3 would put the road in as good repair as it was previously.—His Honour gave a verdict for plaintiff for £10 10s. and costs, and for plaintiff on the counterclaim.

Compensation Case in Huddersfield.—An arbitration case was heard last week in Huddersfield town hall before Mr. S. Jackson, architect, of Bradford, to consider what compensation should be given Mr. Frederick Learoyd, the owner of a brick factory situated in John William-street, Huddersfield, by the Corporation, who are taking part of the property for street improvements. As usual, the value set on the property by the surveyors called on either side showed marked discrepancies. It was stated that the property, which was freehold and 4,200 square yards in extent, was purchased by Mr. F. Learoyd in 1874 for £10,750, and he afterwards paid £444 for streetage charges, making a total of £11,194. The corporation in the following year scheduled the property for improvements, and obtained powers in the Acts of 1876 and 1890 (the first having lapsed) of compulsory purchase. The corporation offered £7,590, and the claimant asked £13,000. For the claimant, Mr. Thomas Fenwick, F.S.I. (Martin and Fenwick, of Leeds), valued the property at £12,675; and Mr. James Kilburn, of Meltham and Huddersfield, endorsed this valuation. Mr. Henry Tinker, of Huddersfield, who sold the property to Mr. Learoyd, valued it for sale in 1873 at £14,800, and now thought it worth more than £12,675, but after consideration had come down to Messrs. Fenwick and Kilburn's figures. For the corporation, Mr. George H. Crowther, Huddersfield, valued the property at £6,979 12s., without reckoning compulsory purchase. Mr. Thomas Albert Taylor, Huddersfield, put the value at £6,808 19s. Mr. Albert Kirk (John Kirk and Sons, Huddersfield and Dewsbury) endorsed Mr. Crowther's valuation. Mr. John Hepper (Hepper and Sons, Leeds) estimated it at £6,906, and Mr. Joseph Smith (Smith and Gotthardt, Bradford) at £6,931. While for the claimant the borough auditor, Mr. Kilner, stated the property was increasing in value, Mr. S. C. Potts, borough accountant, now stated that 16 per cent. of the property in the neighbourhood of the brick factory was unoccupied. The arbitrator reserved his decision.

Employers' Liability. — At the Brompton County Court, on Tuesday, before Judge Stonor, a lighterman named Henry Arnold sued Messrs. Williams and Wallington, the contractors for the Battersea new bridge, for damages for personal injuries sustained by an accident which happened at the works. The plaintiff had taken some balks of timber to the bridge, and they were being raised by cranes, when, owing to insufficient fastening, they fell into the river, smashed the boat, and severely injured the plaintiff's right arm. He was in hospital several weeks, and it was found necessary to stitch his injured hand to his side, so that some of the flesh from his body might grow over it. The evidence as to the accident showed that the chain put round the balks was not tight. The man in charge called out "Ease up the slack," so that the chain might be tightened, but the signal "Right away" was given instead, and the balks were lifted into the air before the chain was properly put on. On behalf of the defendants a case was cited which had been before the Court of Appeal, and in which a man who usually superintended gave an order to a crane man, and thus caused the accident. At the time he gave the order, however, he was engaged in manual labour, and on this ground a verdict was given for the employers. In the present case the banksman who gave the signal was a labourer, but at the time he gave the order was superintending only, and was not engaged in manual labour. After a long legal argument, the Judge ruled in favour of the defendants, and withdrew the case from the jury on the point of law.

Peto Brothers v. Apperley.—In the Chancery Division, on Wednesday, and again yesterday (Thursday), before Mr. Justice Jeune, the plaintiffs moved to continue an interim injunction, obtained on September 23, *ex parte*, restraining the defendant from printing, posting, or otherwise advertising a bill calling on carpenters and joiners to keep away from Cane-hill Asylum. The affidavit of the plaintiffs went to show that the effect of the bill was, and would be, to keep away carpenters and joiners. The affidavit of the defendant was that during the present year a number of London firms locked out the carpenters and joiners, and that the plaintiffs were among those firms. Although there was not a lock-out at Cane-hill, there was at the plaintiffs' works in Gillingham-street, Pimlico. The present action was brought and the motion made on the ground that the defendant's act was in restraint of trade. Mr. Eustace Smith appeared for the plaintiffs; Mr. Fischer, Q.C., and Mr. Besley for the defendant. The case was adjourned till to-day (Friday).

CHIPS.

The Wood-Block Flooring Co. have removed their London office from 22, Charing Cross, S.W., to 11, Queen Victoria-street (Mansion House Chambers), E.C.

The architectural profession has been honoured in Liverpool by the appointment of an architect upon the bench of city magistrates. Since the death of the late Sir J. A. Picton, architecture has not been so represented. The architect selected is Col. C. O. Ellison, Past President of the Society of Architects.

The Devizes urban sanitary authority have resolved to erect two additional wards to the Infectious Diseases Hospital, at an estimated cost of about £400.

An inquest was held on Thursday on Mr. George Barr, wholesale cabinet manufacturer, of Curtain-road, Shoreditch, aged 51, who died in his bed on Wednesday morning, while playing with a grandchild. Medical testimony showed that death resulted from heart disease, and the coroner mentioned that a son of the deceased fell dead from heart disease about eight months ago.

Contracts have been entered into for banking premises in North-parade and Manor-row, Bradford for the Yorkshire Penny Bank. Mr. Jas. Ledingham, of Bradford, is the architect.

The Bishop of Colchester dedicated on Friday a new organ, which has been placed in Brentwood parish church as a memorial of the late Rev. C. A. Belli, formerly precentor of St. Paul's Cathedral, who gave upwards of £10,000 towards the rebuilding of the church, a work carried out a few years since under the direction of the late E. C. Ayton-Lee.

The statue of Earl Granville will be erected in the Central Hall at Westminster. Upwards of £2,000 has been subscribed for the statue, and the artist is to be Mr. Hamo Thornycroft, R.A.

The frescoes which have just been discovered in the Church of the Angels at Lugano adorned the walls of a chapel. They belong to the Luvain School, and represent the Flight into Egypt, the Adoration of the Magi, and the Nativity. The Government have decided to restore the paintings, and to intrust the work to Signor Masella, the architect.

WATER SUPPLY AND SANITA MATTERS.

The Aberdour-Inverkeithing Water Dis —The terms have now been adjusted for a s ment of the dispute between Aberdour and I keithing as to their water supply. It is pro that the present litigation be superseded; that remitted to Mr. R. Carstairs Reid and Mr. Parker, two of the skilled witnesses, to dete what new works, or alterations upon the p works, ought to be executed, for the purp securing to both parties a full and adequate s of water; and that the whole expenses of the to be so determined, and also the expenses inc by both parties in the litigation, be borne mut in the proportion of seven-tenths by Inverkei and three-tenths by Aberdour.

Castle Donnington Sewerage.—The Shar guardians lately advertised an open competitio the best scheme for the sewerage and sewage posal of Castle Donnington. Mr. W. H. Rad C.E., of Nottingham, has just been awarde first premium, and a vestry meeting of the payers will shortly be held to consider the d bility of carrying out the scheme at once. population is about 2,500, and it is propos deliver the sewage by gravitation on to ten ac suitable land, where it will be purified by i tion. The storm-water from roads will n admitted to the sewers. Part of the outfall will consist of an iron pipe siphon 750 yards The cost of the engineering works is estima £2,300.

Halifax.—On Thursday, the 17th ult inquiry was held by Mr. J. T. Harrison, a spector of the Local Government Board, a Halifax Town Hall, in reference to the applic by the Corporation for sanction to borrow £3 for the purpose of street improvements; £2 for works of sewerage; £7,000 for baths at W side, Haley Hill; £4,000 for the purchase of Vue Mansion for use as a free library, and £5 for the construction of new markets. Plans o baths were shown by the architects, Messrs. Ho and Williams, and of the markets by M Leeming and Leeming, the designs in both having been selected in competition. The insp stated that the Local Government Board w probably refuse to sanction any loan on behalf free library.

Metropolitan Water Supply.—The Sp Water-Supply Committee of the London Co Council has prepared a report on the proceed in Parliament on the Water Bills of last Se They recommend the County Council to adop following resolutions:—1. That the council, w expressing its readiness, so far as its legal po enable it to do so, to undertake the duties obligations mentioned in the 1st, 2nd, and 5th recommendations in paragraph of the report of the Select Committee unable to accept the condition contained i 3rd recommendation, that the Council, if stituted the water authority, should be req to purchase the undertakings of the eight companies "by agreement, or, failing agreem by arbitration, within a fixed period." 2. the Council is prepared to accept and act upo following recommendation, contained in the r of Sir William Harcourt's Select Committe Water Supply—viz., "That for certain purpo least it would be desirable to acquire the u takings of the existing companies, if the same be obtained on fair and reasonable terms." That the Council is of opinion that the pr be given for the undertaking of any com should depend, not merely on past dividends Stock Exchange values, but upon the true val the undertaking, having regard to its legal po and liabilities; to the condition of the prop and to its ability to supply future wants. 4. in order to arrive at a satisfactory conclusio this last question, it is essential, before any of purchase can be considered, that the liabilit capital expenditure for new or supplemen sources of supply in the immediate future sh be authoritatively ascertained.

Shrewsbury.—Owing to the necessity fo improved water supply for the borough to mee needs of the inhabitants, steps have recently taken by the Water Committee of the Town Co for augmenting the supply, and with this alterations have been made at the works, and machinery provided by Messrs. James Simpson Co., Pimlico, S.W. The new machinery comp vertical Worthington pumping-engine, with pu valves, and pipes, together with a Lanca double-flued boiler, with all mountings and con tions to the engine. The head of water which the pumps will work is 200ft., and they be capable of raising 1,000,000 gallons in tw hours from the well into the existing delivery which is about 900 yards long. The new machi which has been constructed under the superv of Mr. W. C. Eddowes, borough surveyor, formally started on Thursday in last week b Mayor.

STATUES, MEMORIALS, &c.

ST. ALBAN'S CATHEDRAL.—During last week, two new figures were placed in the niches at the back of the screen. The figures are full size, and that occupying the niche at the south side represents St. John the Baptist, clothed with a garment of camel's hair, and his mantle is thrown over his shoulder. In one hand he grasps a cross, and with the other points to the central figures—the Virgin and Child. The central sculpture is the newer new figure. It represents the Madonna holding the infant Saviour in her arms; the child with his arms extended in the form of a cross. The figures, which were carved by Mr. Harry Hems, of Exeter, are executed in yellow Mansfield stone. Preparations are also being made for the erection of a cross on the vacant cruciform space on the front of the screen. The cross will be of plain yellow stone, with angels at the side supporting; the latter will be of clunch stone. The cross will be supported on a cap and base, and will stand 3in. from the face. The dimensions are 11ft. by 5ft. 4in., and will be placed in three sections.

STAINED GLASS.

BRADFORD.—A stained-glass window has been placed in the Unitarian Church, Bradford, in remembrance of the late Mr. Joseph Hainsworth, of Lidget-green. The subject represented is Christ's Sermon on the Mount, to illustrate the text "Wherefore by their fruits ye shall know them." The work is from the studio of Messrs. Powell Bros., 30, Park-square, Leeds.

WEST BOWLING.—Mr. Jesse Galloway, of Bowling Old-lane, has presented to St. Stephen's Church, West Bowling, two more stained-glass windows in addition to the east window given by him some time since. These last windows are designed to continue and complete the series of subjects as originally selected in illustration of the Passion of Our Lord. The Messrs. Powell Bros., of Park-square, Leeds, are the artists.

CHIPS.

Mr. C. H. Mabey, sculptor, has removed his studio and workshops from Princes-mews, Westminster, to more convenient premises, 150A, Vauxhall Bridge-road, S.W.

Yesterday the new bridge over the Kelvin at Great Western-road, Glasgow, was formally opened by the Lord Provost of Glasgow. The construction of the bridge has cost £45,000. The bridge consists of four arches, two of 91ft. each across the river Kelvin, and two land arches of 34ft. each. The three piers are of stone, the abutments and wing walls being faced with grey Kemnay granite blocks, while the pilasters are of red Corrennie granite. The arches themselves are of iron, with geometric tracery in the spandrels, and there are also open iron parapets. The width of the bridge is 60ft.

The new schools at Walshaw, near Bury, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Mr. E. H. Shorland, of Manchester.

By public subscription a timepiece with one slate dial has just been erected in the Baths, Aberdeen. The work was intrusted to J. B. Joyce and Co., of Whitchurch, Shropshire.

The opening lecture of the session in connection with the classes in Architecture, Construction, Architectural Drawings, &c., at University College, London, will be delivered by Professor T. Roger Smith on Monday evening next, the 5th October, at 7.30 p.m., at the college in Gower-street, subject, "New Departures in Architecture." The lecture will not only touch upon the past, but upon the possible future of architecture. Admission free and without tickets.

The National Health Society has again organised winter courses of lectures on sanitation, domestic and personal hygiene, and other subjects. These lectures will be given in the lecture-room of the Society, 53, Berners-street, W., by the society's staff of lecturers, each being illustrated by diagrams and models.

New science and art schools are to be erected at Lancaster, on the site of the Mechanics' Institute and some adjoining buildings, all of which are being razed to the ground. The new schools will be Renaissance in style, and will have frontages of 60ft. to Meeting House-lane and 43ft. to Market-street. Besides schools the building will provide accommodation for the museum, library, and art gallery. Messrs. Paley, Austin and Paley, of Lancaster, are the architects.

The second, or Ince, section of the Manchester Ship Canal, from Ellesmere Port to the River Weaver, was opened on Tuesday. By the completion of this section of the canal there are now opened eleven out of a total of thirty-five miles of waterway between the Mersey and Manchester.

Our Office Table.

THE committee of the Architectural Association having considered the applications received for the four vacant A.A. scholarships, have awarded them as follows:—Two scholarships, value £10 10s. a year each, tenable for two years, and eligible to students entering the first year, awarded to E. A. Rickards, Dunn and Watson, principals, and to Arthur J. Stratton, A. E. Street, M.A., principal. Two scholarships, value £10 10s. a year each, tenable for two years, and eligible to students entering the third year, awarded to W. C. Waymouth, H. C. Boyes, principal, and to C. C. Windmill, J. T. Newman, principal. Mr. Arthur Cates has founded a scholarship, value £10 10s. a year, which will, upon certain conditions, be awarded to the student who passes highest in the intermediate examination. The A.A. medal, given this year for designs for a country house has been awarded to the competitor under motto "Nihil Sine Labore." It is by no means a pleasing sign of the times that the Architectural Union Company's prize for measured drawings has failed to attract any competitors.

THE annual report of Mr. James P. Norrington, surveyor to the Fulham vestry, states that the parish is rapidly increasing in population, as shown by the census returns, the number of estates that are being laid out, the length of new sewers laid, and the fact that nearly a thousand plans of new buildings were submitted for approval. During last year the largest wood-paving contract yet undertaken by the vestry was carried out, being that of the Fulham-road, 1 mile 140 yards in length. On Mr. Norrington's advice the vestry adopted creosoted deal blocks for the Fulham and North End roads instead of plain deal. He urges the importance of laying out the 12 acres known as Bishop's Meadow and West Meadow as a park without further delay, the land having been allowed to remain in its present discreditable condition, with the area being decreased by the action of the river, since the original grant in 1884, and the Ecclesiastical Commissioners have threatened to reconsider the question of the grant, unless the vestry evince more earnestness in accepting the trust.

AT the closing meeting of the annual Congress of the Sanitary Association of Scotland, which was held last week in Edinburgh, under the presidency of Dr. R. Farquharson, M.P., a resolution was moved by Dr. Southwood Smith, of Motherwell, supported by Dr. E. Duncan, of Glasgow, and Mr. Kenneth Cameron, of Aberdeen, declaring it to be necessary to the preservation of the public health that plumbers should be systematically trained and registered under adequate statutory powers. The resolution was carried unanimously, and remitted to the Parliamentary Committee of the Association to consider, and to petition in favour of any Bill promoted with those objects.

FOLLOWING on the exposures of corrupt practices in high places in Canada, the newspapers of New York have recently been filled with letters of complaint about the ease with which the deputy inspectors of buildings in that city are bribed. It is asserted that these officials multiply the difficulties and delays incident to the passing of plans, and the approval of executed constructions, for the purpose of extorting fees for accelerating the examination of plans, or closing their eyes to irregularities in construction. Whether the evil is exaggerated or not, it is evident that the deputy inspectors of buildings in New York and other United States cities are poorly paid for very laborious, difficult, and responsible work, and an occasional yielding to the temptation to accept a small present for an endeavour to oblige would not be very surprising. The *American Architect*, in commenting on this correspondence, remarks that New York is too large to have only a single office for such matters. Our contemporary suggests that it would save time and labour, besides promoting security, to adopt the London plan, by which the city is divided into districts, and some experienced architect in each is made district surveyor.

An arcade containing nearly a hundred shops is being erected at Weston-super-Mare, and will form, when completed, one of the leading thoroughfares in that watering place. Mr. H. A. Forse, of Bristol, is the contractor.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Society of Engineers. "Retort Charging and Discharging Machinery for Gas Works," by H. O'Connor. 7.30 p.m.

TUESDAY.—Glasgow Architectural Association. "Structural Ironwork," by Andrew Robertson. 8 p.m.

Trade News.

WAGES MOVEMENTS.

EDINBURGH JOINERS' ASSOCIATION.—A joint meeting of the five branches of the Joiners' Associations in Edinburgh and Leith took place on Friday evening in the Trades' Hall, Edinburgh, to hear the reply from the Masters' Association to the representation of the workmen regarding the proposed code of working rules. Some of the modifications proposed by the workmen were accepted. In regard to the payment of wages, the employers adhered to their proposal to pay fortnightly, instead of weekly as proposed by the men. Another proposal had reference to the hours of work, the men desiring that from 8th November till 8th February they should work an eight hours' day. The employers' proposal is gradually to reduce the hours of work from nine in summer to seven in winter, and they adhered to their scheme. After discussion it was agreed to confer further with the masters regarding the proposals.

FORFAR.—The master slaters here have resolved to grant an advance of ½d. per hour to their men. The rate of wages now paid in Forfar is 7d. per hour.

THE LONDON CARPENTERS' STRIKE, now in its twenty-second week, presents few new features of novelty. The demonstration of all branches of the building trades held on Sunday afternoon in Hyde Park was very numerously attended, and the resolutions put simultaneously at all four platforms were adopted unanimously, and by acclamation. The first of these declared that the carpenters, joiners, and machinists were deserving of sympathy and support in their struggle, both morally and financially; and the second expressed indignation at the unjust sentences passed on workmen when following their lawful right to picket, and demanded the dismissal of Sir Peter Edlin. The United Trades Committee are increasingly confident of ultimate success, as they are receiving pecuniary support from levies in the other trades, while on Monday the earnest of the promised subscriptions from America came to hand, the first fruits taking the form of a donation of £50 from No. 3 branch of the Amalgamated Society of Carpenters and Joiners in New York, with an undertaking to make a similar levy weekly till the strike ends. Other subscriptions are expected from United States, Canadian, and Australian societies, and it is expected that the strike pay will be raised by sixpence or a shilling per week. Among the firms which have conceded the terms of the memorial during the week is Messrs. Marks. A meeting in support of the movement is to be held to-morrow (Saturday) afternoon in the Haymarket, Newcastle-on-Tyne, Mr. E. Fenwick, M.P., being the principal speaker. Several carpenters have been dealt with on charges of picketing and intimidation during the week. On Saturday, Robert Meade, carpenter, was sentenced by Mr. Shiel, at Westminster police-court, to two months' imprisonment for an assault on a constable at Sloane-square railway-station, resulting from the pursuit of a blackleg to that building; and on Monday, at the Middlesex Sessions, John Bratley was bound over by Mr. Underhill in £50 to keep the peace for 12 months, on an indictment for having assaulted and persistently followed Thomas Saxby, a carpenter employed by Messrs. King and Co., of Pimlico.

NEWPORT MON.—The dispute as to whether 7d. or 8d. per hour should be paid by employers of bricklayers was inquired into by the referee at Newport on Tuesday. The men, after nearly a two months' strike, resumed work on the employers' terms of 7½d., on condition that the remaining half-penny be referred to arbitration. The representatives of the employers urged that 7½d. should be paid during the summer months, and 8d. in the winter. The men's representatives argued for a wage of 7½d. per hour both winter and summer. It was to settle this point that the services of a referee had to be called in. He took a copious note of the entire information adduced, and at the close of the hearing decided to take time to consider his decision.

RHYL.—The joiners, who struck work at Rhyl on Tuesday week, to the number of 50, on account of a misunderstanding with their employers, resumed work on Saturday at an increase of 2s. (30s. instead of 28s.) and a reduction of three hours per week in time (55 in lieu of 58 hours).

Penge has, by a majority of 1,025 votes to 275, decided to adopt the Free Library Act.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXI.—No. 1918.
FRIDAY, OCTOBER 9, 1891.

SCALE AND SKYLINE.

SIZE and outline constitute two of the leading circumstances of buildings. They impress us more than a multitude of lesser qualities. The traveller is impressed by the greatness of edifices like St. Peter's at Rome, the magnitude and grandeur of façades like those of Chartres and Rheims, the Louvre, St. George's Hall, Liverpool, and St. Paul's. The mass strikes the spectator before the parts or details of which it is composed. But we judge of each of these buildings not so much by its actual size as its relation to other structures in its immediate neighbourhood, and it is this relative size which we call "scale." To what an extent this scale or proportion operates in our architecture may be noticed by comparing the windows or other features of one building with those of another, especially when they happen to adjoin. The larger the openings are in one building, the smaller those appear in the adjoining one. Insignificance and pettiness of detail are often owing to this unfortunate comparison in dimensions. A proper scale or proportion of features is one of those things which the competing architect is apt to forget when he designs a public building for a site which is full of large and imposing edifices. Not knowing the "scale" or size of the adjacent structures, or imagining that the proposed building will be larger, he adopts perhaps a very ornate Gothic façade full of small parts and windows. Pinnacles, gables, and angle-turrets abound. Let us imagine such a building set up beside, or near to, a Classic town-hall like that of Birmingham or St. George's Hall, Liverpool. The comparison would be disastrous, if not odious." The small windows and details would be at once reduced in size, the ornate parts, the turrets, and gables would become toylike and tawdry. On the contrary, the classic edifice, with its few dignified divisions, is at once enhanced by the scale of small parts of the Gothic set up beside it; it looks really imposing.

We refer to this question of "scale" as one that concerns the architecture of our towns. The mania for huge buildings, lofty hotels, and residential flats and offices, partly brought over from the United States, and partly owing to the increased value of ground rents, is destined to spread. The houses of four and five stories of moderate height are giving place to blocks of houses and shops of considerably greater elevation, which completely dwarf the older dwellings and business premises, and render them no longer tenerable to live in, overshadowed as they are by monster premises adjoining or in front. These prodigious blocks meet the eye in many parts of the Metropolis. We see single blocks of this kind in the Gray's Inn-road, not far from Clerkenwell-road. A little farther westward, between Oxford-street and Broad-street, red brick buildings of considerable elevation are seen, which grow into insignificant contrast the older and smaller houses near. Oxford-street presents several huge fronts, which materially serve to diminish in scale the other street premises. In the Brompton and Fulham roads we meet with many large blocks of buildings of recent erection that have thrown into comparative insignificance the old houses. Our remarks receive a more perfect exemplification from several recent structures erected facing the Victoria Embankment, which have mainly suggested this subject. We take that portion of the Embankment between Waterloo and Westminster Bridges. Here we have five or six gigantic buildings of considerable elevation, though their size is less apparent now they are ranged within a short distance of each other, and have, to a certain extent, obscured the older houses behind them. On the site of the National Opera House is erected the granite and red brick block of New Scotland Yard, a massive and solid-looking structure of considerable bulk, that immediately it was roof-high reduced to toy-like proportions St. Stephen's Club, which till then was an edifice of some pretensions to size. Beyond the home of the detective force is the huge pile of palatial elevation between Whitehall and the Embankment and fronting the Gardens, let as residential flats, and known as Whitehall Court, designed by Messrs. Archer and Green. This is a stone-fronted building, well broken and grouped in its masses and roof line. The four pyramidal pavilion roofs of green slates break pleasingly, and make an agreeable skyline, especially when seen in perspective from the Embankment Gardens. This extensive pile adjoins, and works in with as a composition, Mr. Waterhouse's National Liberal Club, the polygonal tower of which terminates the acute angle formed by Whitehall-place. The unsightly corner between Northumberland-avenue and Whitehall-place, the Hotel Metropole, and the corner formed between Craven-street and the avenue, with the Charing Cross Terminus, make a break in the frontage, after which we come to the monster hotel between Salisbury and Cecil-streets, with its end pavilions and domical roofs in course of construction fronting the garden of the Embankment, and forming part of the Salisbury Estate scheme. Next to this structure, which is of red brick and stone, follows the Savoy Hotel, and the Medical Examination Schools adjoining Savoy-street. These three last-named structures vary in size, and, as seen from Waterloo Bridge, make three great steps in the skyline, completely throwing out of scale the older terrace of houses known as the Adelphi-terrace. The latter, compared with the colossal hotel which is being constructed next it, is completely dwarfed. Not long ago the Adelphi-terrace was a stately row of houses, imposing by its elevated situation overlooking the Thames; it appears now in distance quite a diminutive terrace. As a study of relative scale, this group of old and new buildings is at least instructive. A large many-storied structure must, of necessity, be larger in its parts: each separate story is higher, the windows are larger, and this increase in size in the parts tends seriously to diminish private dwellings, and to reduce them to comparative insignificance. But the stories are not only higher in themselves: they are multiplied also, making a greatly increased elevation. The result of this twofold increase of magnitude is to produce a kind of paradox in the mind of the observer, and to make him almost imagine that a larger specimen of humanity inhabited these more colossal buildings. Doors, windows, stories are all magnified as if they were intended for a Brobdignagian race.

The older buildings in our streets are rapidly falling out of proportion by the erection of these lofty structures. We should not object so much if, with their greater height and proportion, we could widen our thoroughfares at the same time; but this is impossible: we have to submit to the inevitable craze for monster hotels and residential chambers, such as those which now overpower the few small and quiet-looking houses in Arundel-street, Surrey-street, and Cecil-street. Here we find the old brick fronts of four stories not reaching more than half way up the adjoining warehouse or hotel, appearing, in fact, crushed. One of the ground stories of these large structures extends to the third story window of the house adjoining. The matter is one that concerns the architect engaged in building. He may have a colossal structure to compete with on one side, and the question is, How can a certain dignity be given to a building of inferior size? One of the principal difficulties is to adjust the horizontal lines, or the height of the stories. The cornice of a ground-floor story of the larger building probably breaks rather unpleasantly into the third or fourth story window of the small building. This ought to be avoided by arranging the lines of the small façade that they agree as far as possible in level with those adjoining. As the disparity of scale is so great, there is perhaps little to be done to remove the impression of insignificance or diminutiveness of the smaller work, except, perhaps, to avoid too much detail and elaboration as tending to increase that idea. Whether it is better to be plain in the parts or full of small detail, is a point that can only be decided by the circumstances. There is one principle to observe, nevertheless, which architects should be careful about if they wish to avoid as much as possible all comparison as to size, and that is that nothing in the larger building should be repeated in the smaller. For example, it would be exceedingly petty, almost amounting to a ludicrous comparison, if an order of pilasters rising two or three stories in the large structure should be repeated on a smaller scale, or if any attempt were made to copy or adopt the same divisions and features of the larger building in the smaller. How absurd it would be, for example, to erect a façade near the west front of St. Paul's of a similar design—superimposed orders, pediments, and towers. The small copy would at once appear ridiculous by virtue of the comparison of scale challenged. The likeness at once invites attention, and always to the disadvantage of the smaller edifice. The principle involved is that all similarity of feature should be avoided, and a varied and completely different elevation be designed. It is therefore that large edifices of a single order, like St. George's Hall, Liverpool, or the British Museum, by the scale of their parts become very trying to buildings of small dimensions erected in their immediate neighbourhood and of columnar design. There is one common standard by which scale is measurable—namely, the human figure, and it would be to the general advantage if the height of doorways and stories was made to bear some moderate ratio to this unit.

Great masses of building are rendered less ungainly by division of parts, breaks in the outline, and by varied skyline. Nothing can be more hideous than a colossal cube, instances of which are met in many of our great warehouses, blocks of flats, hotels, and railway stations. Much of the unsightliness of the huge edifice can be removed by a varied skyline, and we cannot illustrate this feature better than referring to the Victoria Embankment, where hugeness of structure has been in one case much alleviated by a pleasing skyline of pavilions and chimneys. We refer to the large block of residential chambers called Whitehall Court. The other blocks farther eastwards lack this quality, the upper flat lines of roof of the Savoy Hotel, and the Medical School present hard, level lines to the sky, which make their magnitude, in one respect, more painful, while it actually destroys to the eye their real extent. We might go on, and refer to the details of buildings as means of regulating scale. Even the setting out of rustications may be made instrumental in increasing or diminishing apparent size, on the principle that division into small parts has the effect of increasing the apparent dimension. Attention, at least, to the subject is more than ever demanded by the vicissitudes of modern

town buildings, which are often as colossal in their dimensions as they are ugly in outline and vulgar in detail.

PROFESSIONAL BODIES AND THE COMING SESSION.

VERY soon the architectural societies will be in active swing. Members will be recounting their vacation rambles and excursions, others reading papers on professional subjects and discussing modes of practice and grievances. We are not pessimists enough to think that all this labour and intercourse is thrown away—that the profession is neither better nor worse for discussing matters which concern only themselves, which the public neither care for nor trouble about. Of course there are those who believe that it is more politic and necessary to get a wider audience—to address public assemblies rather than small coteries of their own profession. They think it is better to appear in newspaper controversies than in the pages of a society's Transactions, and to become known as architects of millionaires' mansions or town-halls than as readers at learned societies of discourses which are seldom looked at beyond the confines of a lecture-room. We do not deny there is something in this argument—that to know one client or patron is worth a hundred professional papers; but the active and useful members of societies reap a harvest of more abundant satisfaction to themselves, and soon get heard and talked of beyond their own ranks. Few men were more active in promoting the *esprit de corps* of their own profession than the late Professor Cockerell, Sir William Tite, Sir Gilbert Scott, and Mr. Street, or filled more important positions in the art world and professional body to which they belonged, and none certainly had larger practices; and we may say the same of Mr. Alfred Waterhouse, and many more who have filled and are filling offices at the Institute and the Architectural Association.

At the same time, there is one danger to which all professional societies are exposed—that of becoming gossiping clubs, assemblies for talking and ventilating personal views of little practical interest. Discussions are often wearily prolonged by mere talkers, the gist of whose remarks may be summed up in a few words. To avoid this tendency it is necessary to give each meeting some practical subject to discuss, and to arrange, if possible, that each session should have a "backbone"—some matter of interest to maintain attention. Desultory discussion and talking are too often the results of a weak programme. Why, for instance, should not the Society of Architects begin another of those profitable questions in which short prefatory papers are read and discussed on materials and processes allied to architecture or decoration? Questions relating to flooring, plastering and modelling, hygienic and sanitary construction, and decorative applications are always of value and interest, and might at least be given alternately with subjects of more general architectural and archæological interest. Now that the student's education is to the front, it may be necessary, in country associations, to give a course of lectures on some one subject, and so make a provincial society as educational as possible.

The Architectural Association have entered upon a new career. Their new educational scheme will have one good result if it combines the classroom with the studio, as it proposes to do. The lecture is not enough, as it often presents to the student the subject, whatever it may be, from the lecturer's point of view, and does not take into account the real wants of the student. For example, a lecture on such a matter as the strength of girders or structures often presupposes a great deal more knowledge in the mind of the students than they possess, and an expert often assumes his auditors to know all the mechanical actions which take place in a beam and the nature of stresses. The expert lecturer sees his subject in quite another way from that which the student takes, and it is therefore impossible that the instruction can be either instructive or interesting. In this respect the old teaching and classes of the Association failed; but according to the new programme the pupil will be taught from the elements, and he is more likely to follow. The class-room is to supplement the lecture; each student will be examined and be allowed to put questions to his instructor, so that he will be better able to understand each step of the course. A practical example will be set before the student, and this will be followed up in the studio. The lecture, class-room, and studio practice will be concurrent, though, as we understand, a student may enter either course, the lectures or classes only, or the studio only, for a fee of five guineas for each course. The studio course will be that of main value to the articled pupil as to all students, as it will afford him the means of seeing the theory he has learned put into actual practice, as far, at least, as drawing and specification work can do it. In the studio the student will, or ought to be, instructed in making working drawings, details and specifications of real buildings of different kinds: the abstract will here be put into concrete and practical form. But the curriculum may fail from one or two courses. It may be too elaborate and collegiate to meet the requirements of those students who are in offices, and do not care to enter a long course of study; or, secondly, its studio course may not be of that practical character which is required. It does not follow that a good lecturer is a good class teacher or studio instructor, or that the subjects given are those most useful. We are of opinion that, as far as possible, the instructors should be selected from men who have been practical architects, who know what work actually is, and should not be the mere lecturer who has acquired his subject in a cursory, general way, partly by drawing, and partly by reading and study. And there are plenty of architects, young and old, who have had the opportunity of study and culture, who might be enlisted into the service of the Association—men who have had experience of one or more special departments of their profession. Now there are men to be found who have made construction and mathematical principles their study; others who have studied the artistic and decorative side of their profession; others who are experts as specialists. Each of these ought to be represented in the lecture room and studio. How far the studio course will afford the practical instruction required is a question of moment. Drawings and specifications are valuable means of practically testing acquirements, but they can be learned during the term of ordinary pupilage in the office. What the younger pupils require are workshop instruction and practical experience of actual building construction, both of which will necessarily be excluded from the course. The essentials of technical knowledge, the use of tools, and the details of the building trades should form part of the studio course, and it may be worth the attention of societies who are instituting courses of study to provide workshops and practical models, upon the lines of some of the Continental and American colleges. The lecturers also should be able to present their themes in a concrete form, down to the level of the students—a rather difficult thing for men who have been initiated only in the theory of their profession. Many technical schools have failed because the actual problems and examples given have been of a rather stereotyped form. The diagrams and models illustrating brickwork, carpentry and joinery, and masonry, for instance, seen in schools of science and workshops are copied, but make little impression on the pupil. He requires to know how to set out a staircase for a given space and height, and to show its construction; in dome or roof construction the same observation applies. The problem must be set for a given purpose, and the actual details explained as the work proceeds; therefore stock apparatus and models lose their value. A successful curriculum must not stop short at designing on paper, but show how each detail can be executed. There are difficulties in the way of combining the workshop with the studio; but the scheme before us certainly merits a trial as being the only attempt in this country to unite theoretical with practical knowledge.

PHOTOGRAPHS AT THE CAMERA CLUB.

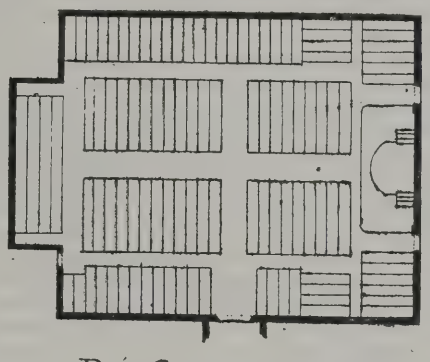
ALTHOUGH no architectural subject grace the very beautiful collection of camera prints which Mr. Ralph W. Robinson displays in this gallery at Charing Cross road, he shows, in the nearly completed series of portraits of members of the Royal Academy to be seen there, some capital likenesses of our architect R.A.'s and A.R.A.'s missing out, we regret to say, Mr. G. F. Bodley, A.R.A., who seems to object to any personal appearance in public, inasmuch as he was the sole member of the Academy among the architects who did not take his place in our "Contemporary British Architects" series of portraits published in the Building News last year.

Mr. Alfred Waterhouse, R.A., is represented in a fine "half-length" seated at his table with a plan of a big church, not the most usual class of building in his practice perhaps, but possibly the nearest drawing to hand at the moment. Mr. Norman Shaw, R.A., sits in front of what might be his drawing-room fireplace, with its marble columns and big plain copper-domed fire-dogs, on a handsome upholstered old English chair of choice detailed carvings on both legs and back. Mr. J. L. Pearson, R.A., left mindful of special surroundings, is seen at his escritoir, midst a mass of correspondence passing on one side the sketch of a small building. Sir Arthur Blomfield, R.A., figures in his portrait with the tee-square, dividers, and all the rest, busy with the preparation of plans for, probably, one of his thousand-and-one varied undertakings. Prof. George Aitchison, A.R.A., in another "at home" representation, is standing at his book-case ready for a reference if not engaged upon "material" for his Academy lecture. Thus each is shown with the particular environments in which their daily work is done, and so we see Mr. Hamo Thornycroft, R.A., in his white blouse, sitting before the roughly-corbelled fireplace of his studio in Melbury-road, or Mr. G. F. Watts, R.A., his next-door neighbour, who is here depicted sculpturing the great equestrian group which he did for the Duke of Westminster at Eaton Hall. Mr. Frank Dicksee, R.A., seated in an old Spanish stamped-leather chair, with quaint antiquities and rare oddities on the walls, seems quite at home, and likewise equally so looks Mr. H. S. Marks, R.A., with his crockery and his birds. Sir Frederic Leighton, P.R.A., in his refined and elegant home, looks the picture of himself, seated in contemplation of "The Sluggard" statuette he so lately published. Few of the painters seem to affect architectural surroundings in their studio fitments, although we know that Mr. Marcus Stone and Mr. Luke Fildes have charming houses from the pencil of Mr. Norman Shaw, while Mr. Val Prinsep lives in the home designed for him by Mr. Philip Webb. Few of these portraits indicate any such harmonious settings in the studio as the outsides of their buildings indicate

Mr. J. E. Hodgson, R.A., stands, with his dog, in front of a wrought-timber screen or entry, which looks very well in the photograph, but it might be a "make up" arrangement. Mr. Alfred Gilbert has a characteristic portrait: he reflects his work, and also his letters, seated in a Morris's rush-seated armchair, with studio properties and unfinished works on every hand, and Mr. A. C. Gow is shown painting, with some old armour suits round about him, indicative of his love of historical subjects. These portraits make a great feature in this exhibition, but Mr. Ralph Robinson's strongest work is in his composition landscapes, with one or two figures to give scale, and perhaps a sense of humour. His prize medal print from the Pall Mall Exhibition of "A Primrose by the River's Brim" is one of these, and "Sweet Springtime" is another, with a lad and a lass love-making near an old windmill overlooking a valley, with all the beauty of a fine English landscape well indicated. There is, too, a beautiful half-length big picture of Sir Fredk. Leighton, P.R.A., printed in rich browns, and throughout the gallery are several nice studies of female beauty, some shown in effective rough wooden frames, bronzed and gilt in metals over the timber fibres and grain. These look very well, if not perhaps a trifle too clever, and they are inclined to detract from the delicate tones of the photographs which they inclose. The Exhibition opened last Tuesday.

NONCONFORMIST CHURCH BUILDING.*

By James Cubitt.

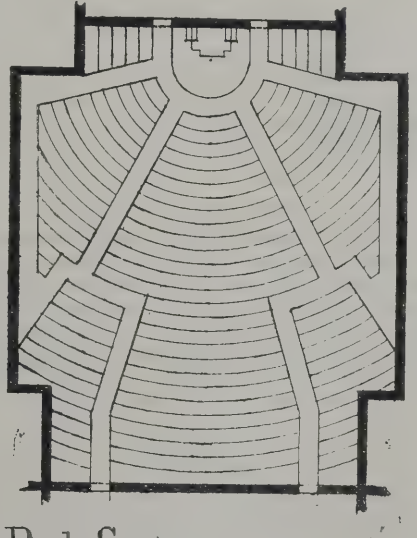


CHAPTER III. (*continued*).

2. FORM OF PLAN.

ARRANGEMENT OF SEATS.—This has, or should have, considerable influence in planning, and should be kept in view from the beginning. To settle the shape of the building first, and then to pack the seats to it afterwards, leads both to inconvenience and to waste of room; yet, judging from results, it is by no means a rare proceeding. A great point is to arrange the seats in suitable lengths. If they are too long, the church may be half-empty while, at the same time, there is not a single pew to spare for newcomers. And long pews, too, are objectionable on account of the difficulty which those who arrive last find in passing a number of persons already seated. The most useful sizes are those which contain four, five, six, or seven sittings. A few shorter, and a very few longer, seats may be needed here and there.

With regard to the direction of the seats, not much is gained, in comparatively narrow buildings, by putting them otherwise than at right angles to the longer axis of the plan. Just at the sides of the pulpit a few may be turned lengthwise. But in wide churches, and especially in those designed on "central area" plans, the case is different. Here it is often well to dispose the side seats diagonally. It is not necessary, however, that they should face the pulpit with absolute exactness, nor is there, in practice, any advantage worth the expense of bending them into circular sweeps; but they should be so disposed that everyone can easily look towards the pulpit, seeing that in most Nonconformist churches it is from that point that nearly everything in the service is read or spoken.



There should never be a middle alley (or so called "aisle")—at least within many parts of the pulpit—when the pulpit is in the middle. When the pulpit is on one side, a middle alley is unobjectionable. Every speaker likes to have an audience in front of him, and not an empty passage. If there is anything worse for the minister than to look straight down an alley, it is to have the main entrance into the building placed in the centre of one of its sides, with an alley leading from this to the other side. About half the congregation will then cross the building, backwards and forwards, at every service. A main thoroughfare, with numerous persons passing to and fro, is thus established right across the middle of the church, cutting the centre block of pews in two, and causing an intolerable distraction both to preacher and people. Both the middle alley and the cross thoroughfare are shown in the adjoining sketch of "Bad Seat Arrangements, No. 1."

Bad Seat-arrangements: N°1.

It is not a mere fancy sketch; but is taken, in its essential features, from a recent competition design for a large Nonconformist church, to which a "professional adjudicator" awarded the first premium!

If it is unpleasant for the minister to look directly down a passage, it is worse to have three or four such passages concentrated on him, so that he cannot even escape them on any side. Yet it is sometimes announced as a merit, in the description of a building, that "all the passages radiate from the pulpit."

Bad Seat-arrangements: N° 2.

The second sketch of "Bad Seat Arrangements" shows this objectionable system; and it also exhibits a second peculiarity, which happens, in a Nonconformist church actually built near London, to co-exist with the other. This is what may be termed a labyrinthine disposition of the alleys. The way out from each part of the building should always be obvious and direct; but in this case, as in some others, a sign-post is almost needed to inform strangers of the various turnings which they will have to take.

Width of Seats.—The width from back to back commonly varies from 2ft. 6in. up to 3ft. The first dimension is small, and the second, in most cases, rather needlessly large. 2ft. 9in. or 2ft. 10in. will usually be found wide enough, and if well managed will allow room for kneeling. 20in. on the seat is a common allowance for each person, though in some large places, such as the Metropolitan Tabernacle, only 18in. are provided.

The width of pews, and also the space allowed for each sitting, should be carefully inquired into in comparing one design with another. What looks at first like a large amount of accommodation at a cheap rate, may turn out to be a mere case of overcrowding. Thus, an area that will seat 500 persons in 2ft. 6in. pews with 18in. sittings, will only allow for 357 in 3ft. pews with sittings 21in. wide.

POSITION OF THE PULPIT OR PLATFORM.

When a committee have any strong feeling on this point, and a decided preference for a position either in the centre or on the side, it may be well to state the fact in their first "Instructions"; since these different positions require a different arrangement of pews. To some persons, a central platform suggests a lecture-hall rather than a place of worship. To other persons, a side pulpit suggests an altar and things pertaining to Catholicism. But, treating the matter simply as one of practical utility, two or three points are worth noting. Where there are side galleries, it is often difficult to arrange for a pulpit on one side of the central space; because, unless it is high above the floor, which is very undesirable, it will be hidden from the persons at the back of the gallery next to it. Where there are no side galleries, a side pulpit allows of more width between the columns in plans like B, C, D and E, already published. The reason for this is that there can then be a middle alley and *two* blocks of seats between column and column; whereas with a pulpit or platform in the centre there can be no middle alley, and consequently only one block of seats there. Where, also, as at E, there is a baptistery, a side pulpit helps to economise space, because if the pulpit were in the centre of the building, the baptistery, according to ordinary Nonconformist custom, would have to be in front of it, and not behind it, and several rows of seats would thus be lost from the centre block, just where space is most valuable. The back of the apse, or of the choir recess, is also a much more convenient place for such a baptistery than the front of the platform, and with a side pulpit it is equally in sight there.

Looking at the pulpit question as one of acoustics, there is somewhat less risk of echo in an ungalleried church when the pulpit is at the side, for then the speaker does not face a flat wall, but rather a corner of the church. In very large, galleried places, on the contrary, like K, a central position is probably better, as the people on one side of the minister would otherwise be too far away.

POSITION OF ORGAN AND CHOIR.

There are, of course, numbers of small Nonconformist churches, and some large ones, in which there are neither organ nor choir. In one of the first rank, built some years since, in which there are both, the following memorandum was issued to the architects who were invited to compete.

"Our worship is not *choral*, but *congregational*. No hymn, chant, or anthem is sung in which the congregation does not join. The idea, very largely realised with us is, that the whole congregation shall sing from music-books in four-part harmony.

"The choir, technically so-called, is therefore only part of the singing congregation; its function is simply to lead it. It should

* All rights reserved.

therefore be in it, and of it—under no circumstances separated from it. It should be felt in its lead and control of the congregational song, but not seen, or even heard, apart from it. Hence it should be so placed as to be part of the congregation. The great attainments of the present congregation in musical worship are to be chiefly attributed to this arrangement, and could not be realised with a separate choir in a choir-gallery; for which, consciously or unconsciously, the congregation listens. The choir must, of course, be contiguous to the organ, and in possible communication with the organist."

Such a complete merging of the choir in the congregation is not always attained, nor, perhaps, attainable. Ideals differ, and there are cases in which a separate choir is preferred. In any case it should be somewhat raised above the congregation, and should face rather to than from them. Its position will naturally have to be arranged along with that for the organ.

The tendency in some Nonconformist churches has been to make the organ painfully obtrusive in appearance; to set it up as the chief object in the interior. In others it is made, with better taste, a less overpowering feature; but then it is frequently put into too small and low a chamber.

A joint-committee of the College of Organists and the Institute of Architects has very recently issued a report on the best positions for organs and choirs. The report states that there is much misconception both with regard to their relation to each other and to the congregation. On musical grounds they consider the old-fashioned position for both organ and choir in an end gallery facing the pulpit to be a very good one. They strongly advocate a lofty space above the top of the organ pipes, "to allow the sound to develope itself and to pass into the church." They do not advise dividing an organ into two or more parts, as is sometimes done. They recommend that organs should not be placed in small or low chambers, but should have a sufficiency of open space round and above them, and a solid, unpierced wall behind them. They say that the organ should be at a short distance from the choir, and that the best distance is about 20ft. They further suggest that the choir may sometimes be put with advantage in side galleries, and should in any case be raised from the floor to an extent proportioned to the length of the building; and also that if it is located in a chancel, that part of the church should not be shut off from the rest by a low arch interfering with the sound.

These, to some extent, are "counsels of perfection," and can only be followed as far as circumstances will allow. It will prove, however, much easier to adopt them in Nonconformist than in Anglican churches, and it is worthy of note that, years before they were issued, some of the principal ones had already been acted on in the building mentioned in the first paragraph under the present head.

STAIRCASES, LOBBIES, AND EXITS.

Public buildings should always be so planned that different streams of people, as they go out, will not come into collision with each other. It is chiefly from a neglect of this rule that so many persons are yearly crushed to death in cases of panic. The ideal system would be for every alley and every staircase to have its own independent way out into the street, and its own separate doorway. Of course, the different lobbies and passages need internal means of communication between them; but there should be a separate and direct way out for each main stream of people to which it will naturally take in case of alarm, and in which it will not meet or impinge upon any other stream. All doors should open outwards, unless, in the case of very wide outer doors, they are made to slide apart, or to sink into the basement, &c. The point is, that they shall never be liable to be jammed by the pressure of a crowd.

The staircases should be of incombustible materials. The steps should be securely supported at each end, either by walls, wrought-iron joists, or otherwise. Where there are balusters and handrails, these should be very strongly fixed.

The steps are best in short straight flights, with frequent landings of sufficient size. Winding steps, wide at one end and very narrow at the other, should never be used in public staircases. It was the use of these which caused the terrible accident during a service at the former Surrey Music Hall, when a large number of persons were killed and injured.

The minimum sizes allowed in London for passages, &c., in buildings requiring a music license are the following. No staircases or passages open to the public may be less than 4ft. 6in. wide. If a staircase or passage is liable to be used by more than 400 persons, it must be 6in. wider for every additional 100 persons, over the first 400. If a staircase is more than 6ft. wide a dividing handrail must be put down the middle of it; and there must never be less than two staircases, however small is the accommodation above the ground floor. These rules do not at present apply to places of worship; but they may be useful as a general indication of what is necessary.

Lobbies should be so planned as to cut off draughts, without materially obstructing the outward passage of a crowd. The total door-space should be ample; but very wide and heavy single doors should be avoided. Of course, care must be taken to see that one door, when open, does not block or partially block another one, nor project across the stream of people. Where circumstances permit, it is well that lobby-doors should have no fastenings, and should simply close themselves by spring centres or spring hinges. These may now be obtained of forms which will shut firmly but slowly, and without clatter. It assists in keeping out draughts if lobby-doors open outwards only, and do not swing inwards also. Any wind from the outside then helps to shut, and not to open them. It is best when the doors into and out of a lobby do not face each other in a direct line, but, rather, are placed at right angles. The wind then cannot blow straight through, but has to turn a corner before reaching the interior of the building, and this destroys much of its force.

SUBSIDIARY BUILDINGS.

As the work carried on in connection with a church becomes more diversified, these tend more and more to increase. At the least a minister's vestry and a room for the church officers are needed. The former should be near the pulpit, and both rooms should be in easy communication with each other. Lavatories and latrines in suitable positions are, of course, necessary. A separate well-lighted and cheerful room is commonly found desirable for ladies' working meetings and similar purposes. This should be readily accessible from the church, so as to be available in cases of sudden illness, and should have a separate exit of its own. Rooms for adult Bible-classes are also very useful, and will be turned to account in connection with other kinds of study, as well as for debating societies, &c., and for the practice of music. A separate reception-room or "church parlour" for social meetings may be added, if means will allow, with a kitchen and serving-room as its appendages. If the kitchen happens to be on a different floor, a lift from it to the serving-room saves much labour.

Sunday-schools and other class-rooms will be treated of separately. A lecture-hall for week-night services and for secular meetings is very useful when it can be afforded; though, by particular arrangements, the Sunday-school, or some part of it, may often be conveniently and economically made to serve instead. Some churches, again, have a mission-hall adjoining them so fitted up and conducted as to attract the classes who seldom enter a place of worship. A reading room and library, too, are occasionally added, and as time goes on it is probable that the list of subsidiary buildings will become yet more varied and extensive. Caretakers' rooms, which are always useful, become almost a necessity when there is thus a group of subordinate buildings belonging to a church, some or other of which are in use almost every day of the week.

HOT-WATER ENGINEERING.—XVII.

Supply of Hot Water for Baths and Domestic Purposes.

PIPES, COCKS, AND APPLIANCES.

As mentioned in an earlier paper, the correct iron tube to use for these works is that known as "red steam," a pipe of stout quality distinguishable by its red colour, except when it is galvanised. In the latter case, the thickness of metal has to be observed, as the majority of galvanised tubes are for gas-works and of lighter quality. Gas tube is occasionally used for hot-water works, but only in speculative building property of a poor class; no one using this material who has any intention of guaranteeing their work.

In London, and the southern half of England generally, the plain red tube is used, as the hard water, by depositing carbonate of lime upon the inner surface, prevents rusting; but in those districts having soft water (and there are some other waters) a tube which will not readily rust has perforce to be used. The rusting process, of course, weakens and ultimately destroys the pipe if of plain iron, and this action is very rapid in some districts. In those places where the water has such a very vigorous action upon iron, the galvanised variety is of little use, as any imperfections, and those parts that may have been cut and the surface injured, will also be attacked seriously. It is chiefly in the North of England that these waters exist; the soft waters that are met with here and there in the South have not the destructive qualities so pronounced. In the Yorkshire district recourse has to be had to lead pipes, and with this metal there are several pecularities to be mentioned.

In the first place, lead pipe is more expensive than iron; but this difference in cost would be balanced by the lessened time in running it, over that in using lead pipe for this purpose an exceedingly strong quality must (or should) be used. Many good firms who have to erect hot-water apparatus never use pipe for the circulation having a less substance than $\frac{1}{16}$in. or $\frac{1}{8}$in.—that is, a pipe of 1in. internal diameter would measure $1\frac{1}{8}$in. externally. Those pipes in which the water does not circulate need not be quite so heavy, as it is the heat that brings about all the effect in the following way.

To lead is attributed the peculiar action of expanding when heated, like practically all other substances, but does not contract to its normal size as it cools. Usually it is said that no contraction whatever takes place as the metal loses heat; but in any case it certainly suffers in time by the heating and cooling process. From this account the stout quality of pipe is used, for its strength by itself helps materially to deal the ill-effects explained. Tin-lined pipe, on account of its greater rigidity, is a good material, although to the best of the writer's belief the internal lining of tin has been introduced to obviate lead-poisoning (plumbism), that may be feared from the action of certain waters upon lead pipes.

The sizes of pipe used are the same with as with iron, as may be understood; but a deal of care must be used in running the pipe to supporting it, as its own weight, and the other strains which it is not so well able to bear, tend to stretch and distort it. With iron pipe a hook here and there is generally found sufficient to support it, on account of its own rigidity. With lead pipe this rigidity, even with the most strong qualities, is almost totally absent. The best way to support horizontal lead pipes is to place strips of wood beneath them. That which is used as tile batting, and is about 1in. square

swers well, and can, of course, be readily tained. For conspicuous work, however, this ood will require to be planed. Sometimes a ter relies upon a more than usual number of oks to keep his lead pipe from "sagging" wn, as it is commonly called, and this is suffi-nt if the pipe be strong, but it is not nearly sightly as using wood fillets.

Lead pipe that is carried vertically requires ll securing, and fillets are of no use in this se. A vertical pipe does not "sag" nor get t of the straight; but with 40ft. or 50ft. ngth the weight of the pipe itself is amply fficient to stretch it, without the weight or essure of water within it. In one instance nich the writer has in mind, the pipe was not fficiently secured, and this caused a result like

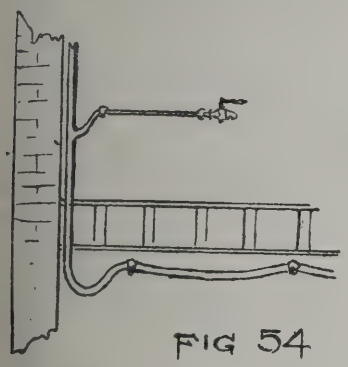


FIG 54

g. 54. When lead pipes are used the boiler is nerally of copper, and the connection between e two is effected with brass unions. It is a od plan, however, to have the pipes which are nnected to the boiler for, say 6ft., in copper iron, well galvanised), as instances have been own in which lead pipe, situated in very hot ickwork, has melted, when the apparatus has en emptied the instant the fire has been awn. It is a common practice for workmen, nen they attend to clean a boiler, to withdraw e water, immediately the fire is extinguished ere is no objection to this, if the pipes be iron copper, but with lead pipes trouble may ssibly ensue, as the brickwork behind the nge does not cool very rapidly. If lead pipes e used in hard-water districts, a coating of fur ide them will permit of the heat outside ving a destructive effect.

TAPS.

Cocks are practically limited to two varieties, e plug, and the screw-down. There are some f-closing cocks that act a little differently to se, but are not in sufficient demand to require cial notice.

For hot-water works, carried out with iron e, the plug cock has most general favour, the w of water is most rapid from it, and it is tantly opened and closed. A screw-down k of the ordinary kind has an enemy in nearly ry servant that uses it, on account of the ewing and unscrewing process. The ordinary g-cock with a nut at bottom is not so gener-y liked as the gland-cock, for although it is a le cheaper in first cost, it is more liable to kage. The gland-cocks have the plugs secured a stuffing-box at the top, and no leakage can ur at the bottom of the plug, where it is usual it to first show itself. The plug itself is as ble to wear as the other variety.

There are two ordinary patterns of gland-ks, the stuffing-box in one case being a cap, d in the other two plates of a suitable shape ured together with bolts. Figs. 55 and 56 w the two patterns. These should be of good lity; it is never an economy under any cir-nstances, and it certainly never proves a commendation, to use cheap taps.

The only objection ever raised to plug-cocks is violence with which the water issues from m if a pressure exists, and this violence is re trying and likely to cause trouble when the ter is very hot. In high buildings, with the tern situated at the top, the rush of water from in. tap situated at the base of the building to be seen to be understood; but, fortunately, re is a simple and inexpensive remedy for s.

In speaking of stop-cocks it was particularly ommended that the way or passage through m be as full as possible, so as to allow of the freest possible passage of water. Now this suggestion would give very ill results with draw-off taps (excepting the bath, perhaps), on account of the violence with which the water would issue. An ordinary vessel could not be filled

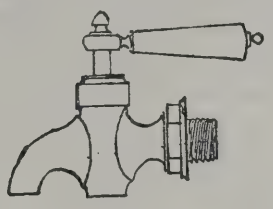

FIG.55.

from a full way bib (draw-off) cock, if a fair pressure existed and the tap was turned full on. The issuing water would enter the vessel, but by its force fly out again. The writer has just tested a $\frac{5}{8}$in. tap which has only 16ft. pressure upon it, and the tap is of the ordinary character (a plug-cock), yet to hold a hand-bowl under it, when turned full on, means simply distributing the water over one's clothes and the surroundings; very little remains in the bowl. This is with cold water; with hot water the results would be a little worse—with very disagreeable results, to say the least.

The remedy for this is to check the tail of the cock, the tail being that part which has a thread upon it, and is screwed into the pipe.

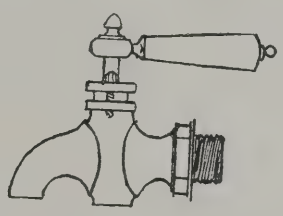

FIG.56.

This part of the passage through the tap is checked by reducing it in size as Fig. 57. Most makers supply these ready for use if so ordered, but if a workman has an ordinary tap to be reduced, he must cut a disc of thin brass or some other metal, and after making a hole in it of suitable size, solder it on to the end of the tail. Let it be very clearly understood that checking the passage the other end of the tap, the nose portion, where the water issues will be next to useless.

The size of the hole in the tail of the tap can be as small as $\frac{3}{16}$in. where the pressure is great, $\frac{1}{4}$in. where moderate; but it is really only taps that are used for filling small vessels that want checking in particular. As mentioned, a bath tap does not want checking, a rapid issue of water being required, and no risk of water flying over the sides; a lavatory basin tap need not be checked either, unless they be large—they are

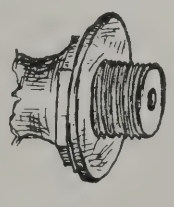

FIG.57

generally too small. It hardly needs mentioning that it is the taps at the bottom of the house that have the greatest pressure upon them, and the most violent issue of water, and it is at these taps as a rule, that the feature in question is most objectionable. Were the kitchen taps upstairs and the bath below, things would equalise themselves somewhat.

Screw-down taps are commonly recommended to obviate the objection there is in the violent outrush of water, as, being slow-opening cocks, the opening (unscrewing) process can be stopped at any moment; in fact, it is doubtful whether a servant ever opens a screw-down tap to the full when she fills her cooking vessels, supposing that there is a good pressure of water. A plug-cock would, of course, just as easily check the outflow of water if it was only partly opened; but it is better to check it in the way explained, and then the servants can use the tap how they like. Screw-down taps will, as mentioned, obviate the trouble under discussion, and do it well; but the majority of servants are opposed to them. Their action is certainly much too slow for a busy kitchen, and on this account a quicker action screw-down cock has been introduced that can be opened or closed with one, half or quarter turn of the handle, the latter being as quick as a plug-cock.

Quick-shutting screw-down taps are gaining favour and being used rather largely in lavatory fittings. It has been contended (by the writer, as well as others), that as the quick action is due to the thread (of the screw-down arrangement)

FIG.58

being of an abrupt pitch, like Fig. 58, this, when worn a little, would become too loose to hold tight, if there was a heavy pressure lifting the seat. In this case, if the seating could be lifted ever so little, a leakage must result, and as the screw-down portion of a tap, when worn, is practically beyond repair, the tap would have to be replaced with a new one. This argument sounds well in theory, but is not correct in practice. The writer has used many such taps, which are all doing well, but a better test has been with two which have been used daily for the last four years by some seven or eight employés. Both hot and cold taps are quite sound: the former one has had a new rubber seating once, the latter has not been repaired at all. This is really good service.

There is one particular advantage with screw-down cocks, which is their non-concussive closing. Everyone has noticed that plug-cocks if closed sharply make a concussive noise—a kind of report—in the pipe near behind the tap. This is really a blow upon the interior of the pipe, caused by the sudden stopping of the water passing through it. We are very apt to consider water a substance like air, that can be compressed or driven in any direction without its exerting any noticeable strain; but as water is (except under enormous pressure) incompressible, the sudden stopping of its passage through a pipe, especially where a pressure exists, might be reasonably compared to the sudden stopping of a solid substance, only in this case the instant the stoppage occurs the strain is not wholly directed against the tap, but presses instantly in all directions. It is this action that makes plug-cocks unsuited for lead-pipe work (if a pressure exists), as the strain referred to will cause the soft material of the pipe to stretch and bulge, and sometimes light pipe has been split in this way. Screw-down taps are almost invariably used with leadwork.

NEW DEPARTURES IN ARCHITECTURE.

THIS formed the subject of Professor T. Roger Smith's opening lecture to the students in the Classes of Architecture and Construction at University College, London, delivered on Monday evening last. Mr. Roger Smith said he proposed to glance at that part of the history of architecture in Europe which was best known to us, simply with the object of noting how, from time to time, a new departure had been taken, and of seeing what an impulse had thereby been given to activity. The periods of activity in European architecture had ever been the periods of change. Starting from the fully-matured Greek architecture of the time of Pericles, the professor showed that Classic archi-

tecture, which had become more feeble and comparatively decadent during the decline of the Greek Republics, received a fresh impetus on the establishment of Imperial Rome, and the raising of vast structures throughout the Roman Empire, when many novelties in construction, as well as in design, were introduced. These changes in treatment illustrated the truth that novelty, though always associated with activity, was not necessarily a guide to excellence. With the Romans of the Empire boundless resources were utilised in architecture for the purposes of lavish and ostentatious display. Two methods of building but little employed hitherto were pressed into the service of the Roman architect—the use of the arch and the use of concrete. The possession of those means of rapid and ambitious construction enabled the Roman architect to perform surprising feats. This new departure started from the arch and concrete, and was favoured by the command of material resources and wealth—of stone, of labour, of marbles, metals, painting, sculpture, in unlimited profusion—in short, of the spoils of the whole civilised world, and was stimulated by the energy of the most vigorous race known to history. He would next inquire how this new departure operated, and what there was about such simple, and to us familiar, things as concrete and arches which contributed to so grandiose a result as was actually obtained. First, he would consider the change involved in the general adoption of the arch. With the lintel treatment, previously general, the scale of every part was necessarily restricted, for no openings could be wider and no columns further apart than the length of such stone lintel as could be trusted. With the arch the size of openings was almost unrestricted; the distances apart of supports could be enormously increased. But this was not all. The arch led to the vault, and this gave the means of covering large sections with a permanent roof, while a further development was to span a circular base with a dome. Further, the architect's command of the arch enabled him to support his vault on a few massive pillars, and thus grew up a series of grandiose structures, which were ornamented with lavish decorations. The use of concrete—i.e., of masonry made of small material, a little coarser than our concrete—enabled the Roman to construct both the vaults and the vast piers which supported them rapidly and comparatively cheaply, while it led him to substitute a superadded surface of marble, stone, or even plaster for the solid masonry of the finest Greek buildings. These modes of building constituted a new departure, and though they led up to results to which we cannot give unreserved admiration, they undoubtedly were associated with a stupendous display of energy. It was not, however, in structure only that the Romans introduced change. His method of decorative treatment, and in some cases his methods of dispensing with almost all that was decorative, relying upon the outlines and the mass of his structure, and the disposition of the openings in walls for architectural effect, were new. He made the Greek orders coarser and less elegant, and often reduced them to the position of subordinate ornament; but he used these with a lavishness, and connected arches to them with a boldness, that were astonishing, and opened a new chapter in the history of architectural design. When the force of the Roman departure had partly spent itself, a fresh force arose and led to a notable new departure, generally known as the Romanesque and Byzantine styles. Both grew out of Roman art, but each was widely divergent from the stem out of which it sprang. At Byzantium many of the conditions of a new departure on a great scale were combined, for, in addition to a new religion, there were a new seat of empire and a new mixture of races. In a surprisingly short time a building of great constructive and artistic merit, and original in almost every respect, was reached. In the edifice Sta. Sophia the methods of the Roman architect were all known and followed, but not exactly followed. The new style displayed an almost exclusive employment of the flat dome, usually lighted at the top, and carried on the domical corbels known as pendentives. The square plan and the quality of the carving, mosaics, and other enrichments were distinctive. It was easy to recognise the Roman architecture as the starting point; but an entirely new character was given to the buildings, and an original and most admirable style had sprung up. Byzantine architecture had continued, without much modification or development, to prevail in Eastern Christendom; but in the West it had not been so. The Romanesque division of Early Christian art was not so strikingly original as the Eastern, and its development was long hindered by invasions of Northern hordes. Later on, after it had been the universal style of Western Europe, it met with influences which varied it, and in Germany was carried to a high pitch of perfection. The next prominent new departure in this art was one of extraordinary interest and splendour, which lay under familiar observation: this was the invention of the pointed arch by the Mohammedans. Some of the peculiar features of the buildings of the followers of the Prophet seemed due to an innate faculty for designing and executing decoration. This was stimulated and drawn out by the impulse given by Moslem conquests to the nations when mosques first began to be built. A more thorough recasting of known features into new forms, and more remarkable creation of new ornaments and original decorations, had never been seen. The dome, the pendentive, the arch, the column, the rough construction encased in plaster, were all derived from Roman methods, but in no case did they look the same as in Roman buildings, while the surface decorations, the pierced stone and metal panels, the wooden grilles, the tiles, the inlays, the mosaics, the coloured and gilded plaster stalactite work, the noble shafts and their capitals, were all new and charming creations, as original as beautiful. The next new departure affecting Western architecture received its chief impulse from the Crusaders, and the recasting of religious establishments. We had in England opportunities of observing the whole development of Gothic architecture, and nothing was more surprising than to note by comparison of buildings of one part of this period with others a little earlier or a little later how continually the architects were taking a new departure, and what scant care they had for the work that lay behind them, so long as they could do something different in what was at hand at the moment. The professor proceeded to describe and illustrate the successive phases through which English art passed during this time. The British and Saxon buildings, generally small and often but temporary, were superseded by the castles and churches of the Norman conquerors, whose power and activity were displayed in an architectural development of great energy, if of varied excellence. The earliest buildings resembled those in Normandy; but very soon indeed peculiarities developed themselves, and Anglo-Norman became a distinct and well-marked architectural style, with an extremely pronounced character and beauties all its own. At the end of the 12th century the churches that were built were large in plan, and when circumstances allowed they were grandiose. The religious establishments were planned with great completeness, and often were of great extent. The castles, on the other hand, were isolated towers, strong, but without outbuildings. From the time when the pointed arch came in, architectural history gave a series of new departures of the most interesting and pleasing kind. What we were accustomed to call Early English, Decorated, and Perpendicular were phases through which Mediæval architecture passed under a stimulus which lasted for more than three centuries after the introduction of the pointed arch. This great building zeal was not sufficient to account for the eagerness and skill with which new forms, new mouldings, new enrichments, and new vaults were elaborated, each one rising out of the one immediately preceding it and taking its place. The pursuit of change did not always mean the attainment of growth. Early English was, on the whole, a finer style than either of those which followed it, and Decorated was finer than Perpendicular. What was secured was vitality and change, not necessarily advance. He came next to the remarkable influence out of which had grown the modern world—the Renaissance. Here we had a new departure, widespreading, far-reaching, full of energy, affecting not only the arts, but literature, science, religion, and politics. It was difficult to say why, but the fact remained that in architecture from the 16th to the 19th centuries we had done nothing but revive past styles, although from time to time brilliant results had been attained by a mixture of styles. Occasionally such a "blend" had not only produced good buildings, but appeared likely to originate a style of modern architecture; but it did not take hold, Europe had gone on erecting buildings for sorts of purposes, all clothed in the dress of s bygone style. In our own country we recently had a "Queen Anne" revival, rather, a revival of Dutch architecture of period of William of Orange, and prior to t a Gothic revival, beginning with Tudor working steadily back, and earlier still, Italian, Greek, and Palladian revivals. Yet ste telegraphy, and other new factors had create rapid accumulation of wealth, and occasio numberless fresh needs, which had stimula building to a remarkable extent, but had slightly affected architecture. He thou however, there were indications that someth like a new departure in architecture was possi and that a 20th century architecture m yet exist. In America we saw buildi largely bearing the impress of one man's gen but which were original as well as excell which all hung together by a certain semblance to a type, and yet possessed dividuality, character, and "cachet." modern style were to arise at all, America w country which seemed to offer a very likely for it to grow in, and from the United State both hoped for and expected great things. second example of something like a new s had lately been seen by many in Paris, w new materials had been employed under conditions, and with very striking results, in Exhibition buildings. The architect of 1890 Exposition buildings in Paris still stand made the utmost use of the structural perties of iron, and of the decorative qualiti ceramic slabs and tiles and metals, w were unquestionably novel, and partook the dignity, solidity, and stability which looked for in architectural works. A par to these buildings, though not so ostentatiou colossal, was to be found in England. concrete, terracotta, faïence, encaustic tile we knew them at the present day, practically new materials, and some of th like iron and concrete, were equal to two diffe materials, each, or even more than two, accor as they were manufactured. In the employ of appliances which science had put within reach of our constructors for such mo purposes as suggested, nay demanded, art treatment, we had the nearest approach to a departure which had yet shown itself, and if anywhere, we had a prospect that 20th century might, perhaps, attain a de English style of its own. The most succe architect of the period now drawing to a had been unquestionably the foremost to em new inventions, or, at least, to give the chance, and to him we owed it that the En people had an opportunity of seeing, on a scale, at the Natural History Museum, wide architectural possibilities the employ of terracotta could introduce. Certainly, most original buildings of the present and the most original designs for buildings about to be erected, seemed t based, so far as their structural peculia went, on the use of iron, and in respect of artistic qualities on the free employment of t cotta. He urged on all students before him if a new departure came in their time they w be safer in going along with it than in stan aloof, as it would probably offer the best cha of doing good and original artistic work. then, Mr. Roger Smith continued, you or so you are to work out the evolution of a new En architecture, original and good, and having its starting point the new and improved met of construction and the new and improved m rials in use, or likely to come into use, it is al self-evident that you must master the scien construction and the art of architecture, or will not be prepared for the task, and here in the claims of improved education. Refer to the recent carpenters' strike in London, Professor remarked that, in his opinion, would have to be substituted for carpenteri roofs, and only those who had studied the bilities of that material would be able short notice, to deal with the structural diffic and to design an appropriate and architec iron framework for the roofing, which w have been in timber. It was evidently more ever necessary that architectural training sh be thorough. In referring to the Inst examinations, the Professor expressed the that students would be even more desirou fitting themselves for the practice of the

ssion than of passing such tests, for, as he minded them, the two were not quite the same ing. In that college (University) facilities for eparations for after-life were now afforded which re not previously available. By the liberality the Carpenters' Company a class of architec- ral drawing had been organised, which had met two afternoons in the week, under Mr. irling's direction. The Carpenters' Company d also enabled them to establish a night-class building construction, to be taught by lectures d drawing, while the existing classes of archi- ture and construction would be continued as fore. These steps were not taken with a view to pose the scheme of the Architectural Associa- n, to which the lecturer wished all success; t they directed themselves to a different ss of students, and in London there was tainly room for many organisations to work moniously.

NOTES ON TERRACOTTA.—I.

TERRACOTTA has been very appropriately designated a higher development of brick- rk, and we are told by John Ruskin and wis Grüner that most of the architectural racotta of Northern Italy, dating back to the h and the 7th centuries, is designed in brick s. As a building material it is yet com- atively in its infancy, for we find it super- ing not only the softer kinds of stone for erior work, but in some instances iron and rble, in its being manufactured into grave- nes and milestones. The famous tub of genes is said to have been of this material. the revival of architectural terracotta we are ebted to no one more than the late Mr. shfield, especially for his experiments in ng or baking, as most of his work consisted the reproduction of the forms of ancient tery; but it has been reserved for Mr. terhouse, Mr. Collcutt, Colonel Edis, and a other architects of the day to benefit by his our, and as an indirect result of such, we have, ably in London, several very fine examples of ldings faced with terracotta—viz., the Natural tory Museum and the City Guilds Institute South Kensington; the Prudential Assurance ces at Holborn Bars; St. Paul's Schools at st Kensington; the Constitutional Club at thumberland-avenue; and latterly, the val English Opera, Shaftesbury-avenue; le one of the most successful treat- nts in this material is that of the façade he Café Monico adjoining. It can, there- , no longer be said that terracotta is a n, and, like cement or stucco, forming only neering of the structure in connection with ch it is used. In some past instances in ch façades were faced with slab-like pieces, ring in thickness from 1½in. and upwards, and together with lip-joints, the word sham was ly applied; but in the buildings above named material is bonded into the work, forming a orate part of the structure.

hough stone will always recommend itself for truthfulness with which it may be worked, considering its rapid decay in the acid-laden spheres of our large cities and towns, one not but be surprised at the slowness with ch the use of terracotta asserts itself. There stronger negative evidence in favour of its than the exterior of the Houses of Parlia- t, in connection with which every precaution taken that was thought necessary to insure election and use of a stone capable of with- ding the acids of our London atmosphere. failure is evidenced by Ransome's patent ate solution, invented expressly to preserve stonework of Houses of Parliament.

CLAY.

he importance of the choice of clay cannot be estimated. No matter how much skill and be expended in the various stages of pro- ion, if the clay be wanting in the essential erties which, by the process of desiccation baking, offer an effectual and enduring tance to the agents of disintegration—or, in words, unless the clay under the action of se heat be capable of producing incipient ication throughout the entire mass—ultimate re will ensue. Clay is defined by the chemist luminium silicate, and is the result of the nposition of felspar, one of the constituents e primary rocks. All soils are originally ed from the granitic rocks. "Silicates of ina," we are told, "enter into the composi- tion of a number of crystallised minerals, among which felspar occupies, by reason of its abundant occurrence, a prominent place. Granite, por- phyry, trachyte, and other ancient interstratified rocks consist in great part of this mineral, which under peculiar circumstances, by no means well understood, suffers complete decomposition, being converted into a soft, friable mass of earthy matter or clay." The Italian clays have long been reputed very superior on account of their natural plasticity, requiring no "grogg" (i.e., broken pottery ground to a very fine powder, and mixed with the tempered clay) to reduce the shrinkage. Taking into account the presence of the Apennines, "those everlasting quarries of granite," as Mr. Ruskin is pleased to call them, in conjunction with the fact that the finest clay is derived from the decomposition of granite or felspathic rocks, Italy might well abound with the marls suitable for pottery and terracotta. Sir Charles Lyell says: "The purest clay found in nature results from the decomposition of a rock composed of felspar and quartz, and it is almost always mixed with quartz."

Subjoined are analyses of some of the extensively worked terracotta clays:—

RUABON RED.

Moisture	1·54
Combined water	3·54
Silica	63·00

Magnesia	0·22
Iron oxide	2·34
Potash	2·31
Soda	2·33
Water combined	9·63
	98·36

Terracotta of the colour known as pinky-buff is obtained by the admixture in proper proportions of red and buff-colour producing clays. The Hotel Albemarle, Piccadilly, is of this colour. London manufacturers get their supplies of clay chiefly from Poole in Dorsetshire, remarkable for its buff-producing clay; and from Dartmoor in Devonshire; also from Lichfield, and other places. The best clays are those which require no "grogg" to regulate their shrinkage, nor foreign matter to produce the required tone of colour. The natural colour of the clay is very much deteriorated by the use of "grogg," which, being so much inert matter, is incapable of undergoing any chemical change in the process of firing. Where "grogg" is used, recourse is often had to a practice known in the trade as "dipping"—i.e., washing over the surface with a thin liquid clay, or submerging the block in a thin solution of pure clay just prior to placing it in the kiln. In this way a uniform tone of colour and the appearance of a close surface are obtained. The colour is a mere veneering, and often after a few years' exposure may be seen peeling or shelling off, exposing the true character of the coarse and mottled clay beneath. A good clay is that which will, without any admixture, stand the maximum amount of firing required, and come out of kiln a good colour, true in lines, giving out a clear metallic ring when struck with a small hammer or chisel.

It is now agreed on all sides that the fine clays of the coal-measures, a term used to distinguish them from the strong, refractory clays of the tertiary strata, underlying recent superficial accumulations, are the most suitable for the manufacture of terracotta. That found at Ruabon, Wrexham, and Pen-y-bont, possesses the characteristics that so highly recommended the Italian clays, viz., plasticity in a very high degree, and, like them, requiring neither "grogg" nor sand, having at the same time a very large proportion of silica and iron in its composition, which add so greatly to its durability; the latter constituent producing that beautifully rich deep tone of colour familiarly known as the Ruabon red. This marl produces both red and blue wares, irrespective of the use of artificial colouring. The clay itself forms part of the deep red-coloured marls of the Permian group, and, in its natural, unworked state, is distinguished by a deep purple tint, imparted to it by the abundant presence of oxide of iron—a very little being sufficient to colour a large tract of clay. The marl of which the blue wares are made is of a greyish purple, in some veins approximating to a decidedly bluish tint. The red clay, if very highly or too much burnt, also produces blue wares.

The blue clay proper contains a larger proportion of iron than the red, and is more highly impregnated with lime, which, acting as a flux in the burning, produces that metallic glaze so objectionable to architectural effect. Firebrick clay, owing to its harsh, coarse nature (potash, soda, lime, and magnesia being absent), is hardly suitable for terracotta. But little practice is required to at once distinguish between the smooth, well-finished wares from the highly plastic and richly-coloured marls, and those from the refractory or strong clays. The former are found in great abundance overlying the coal-workings, the seams or strata in some instances cropping out of the ground upon the removal of the surface mould, and descending to considerable depths, following the dip of the underlying strata. In the inferior clays the desired colour is often obtained by the use of mineral and metallic oxides and of pigments, and sometimes by a surface washing of pure clay already described. The latter can be readily detected by the removal with a sharp chisel of a small portion of the burnt surface.

The choice of the firm from which terracotta shall be supplied should not be determined alone by the analysis of this or that firm's clay; in all cases it will be best to see samples—not stereotyped samples, kept specially for exhibition; but samples of the work incorporated in buildings, by which means alone a true estimate may be formed of the character and quality of the material, especially as to finish. The Tamworth clay is well represented by the Natural History Museum; the Ruabon by the Constitutional Club. Neither of these clays will vegetate if properly burnt, and they are said to make harder wares than any other clays known. The wares have remarkably smooth surfaces and a close texture, giving out a clear metallic ring. All clays should be weathered or exposed for some time before use, for it is generally found when working a new bed of marl that the shrinkage is great and uncertain. Nevertheless, a vast amount of good work has been turned out from clay that has not been weathered; but it is only with the very superior clays that this can be attempted with impunity. The term *marl* is used so vaguely as often to make its meaning very ambiguous. In the brick-making districts of the southern and eastern counties, all clays containing much calcareous matter, whether naturally or artificially, are called marls (malms). All such are excluded from the marls proper for the manufacture of terracotta.

NEW STREETS AND ROADS.

IT is surprising to find the number of new streets that are yearly formed in the Metropolis. The London County Council receive very many applications for approval. Last year there were no less than 109 applications received for the formation of new streets, of which number 43 were granted. The development of suburbs, which is constant, necessarily implies an increase

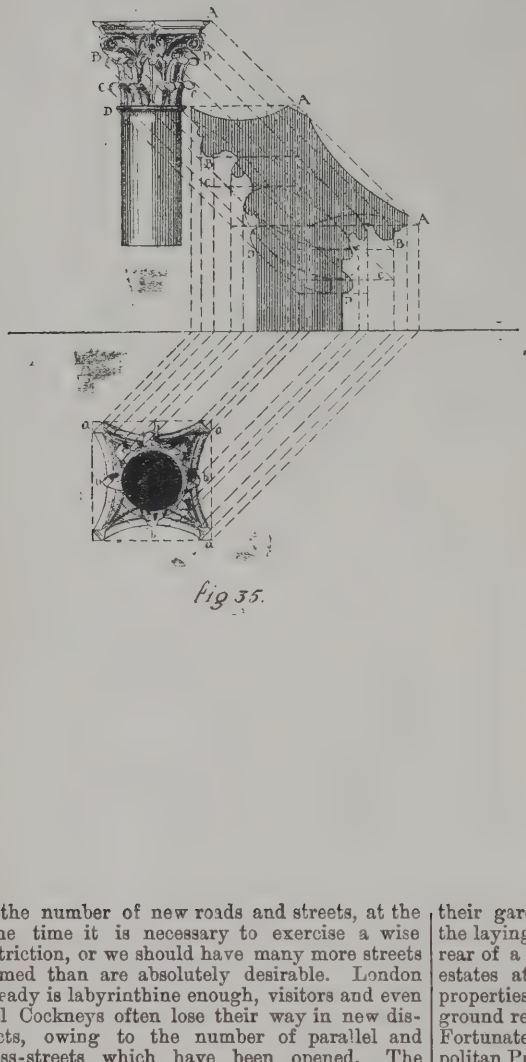

Fig 35.

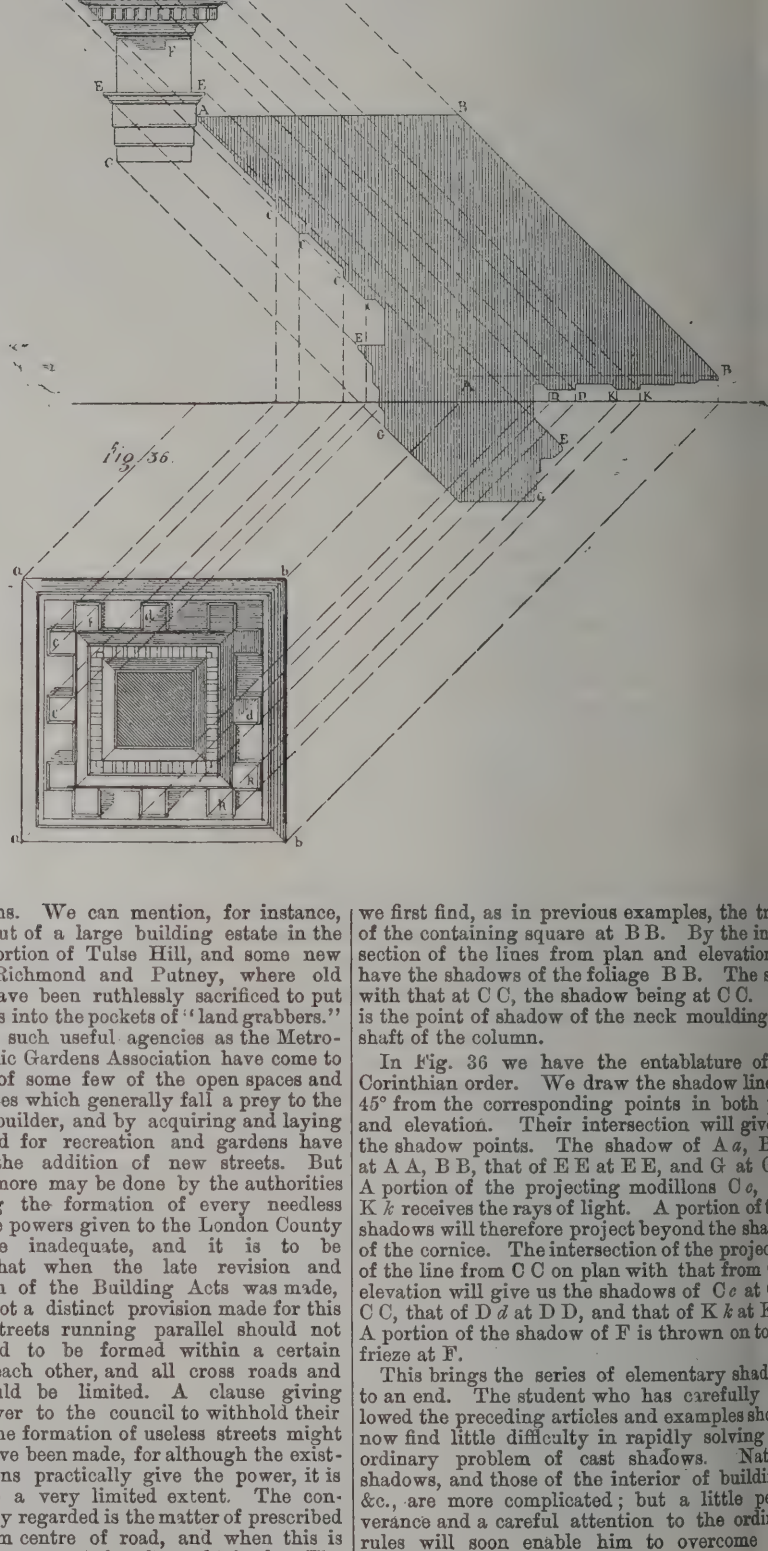

Fig 36.

of the number of new roads and streets, at the same time it is necessary to exercise a wise restriction, or we should have many more streets formed than are absolutely desirable. London already is labyrinthine enough, visitors and even real Cockneys often lose their way in new districts, owing to the number of parallel and cross-streets which have been opened. The provisions of the Metropolis Management Amendment Act 1862 gives the County Council power to receive and consider plans for new streets. Section 98 provides that no road, passage, or way, being of a less width than 40ft., shall be laid out for building as a street unless it be of the full width of 40ft. This salutary rule has been generally followed, and has resulted in the abolition of those *culs de sac*, which once were so common in old towns, for it is also provided that such new streets shall be open at both ends. But, even with these restrictions as to width and communication, a much larger accession of new streets is the result than are convenient or desirable, for the obvious reason that in laying out new estates the ground landlord or his advisers desire to obtain the utmost length of frontage possible in the given area, so as to multiply the plots for building. Now, this inducement to form new streets is getting really a nuisance, except for a few occupants of any particular road or street who desire a near cut to a main road or railway-station. The disadvantages considerably overweigh the conveniences. First as to cost. More streets than are absolutely required have to be maintained at the cost of the ratepayers; second, traffic is diverted from the main thoroughfares—the trade thereby suffers; third, the locality is so intersected by small streets, that property falls in value; fourth, small houses and gardens are the result, and the whole character of the locality is lowered in consequence. Many other drawbacks may be mentioned, such as the great public inconvenience of finding out a certain street and house, the confusion of postmen and tradesmen in deliveries of letters and goods; but those we have named are sufficient to show the perniciousness of the needless formation of new streets, and the consequent deterioration of the value of house-property. All parts of London are subject to the grievance, and even old and valuable properties are being ruined by the making of a new road or roads in the rear of their gardens. We can mention, for instance, the laying out of a large building estate in the rear of a portion of Tulse Hill, and some new estates at Richmond and Putney, where old properties have been ruthlessly sacrificed to put ground rents into the pockets of "land grabbers." Fortunately such useful agencies as the Metropolitan Public Gardens Association have come to the rescue of some few of the open spaces and private estates which generally fall a prey to the speculative builder, and by acquiring and laying out the land for recreation and gardens have prevented the addition of new streets. But something more may be done by the authorities in opposing the formation of every needless street. The powers given to the London County Council are inadequate, and it is to be regretted that when the late revision and consolidation of the Building Acts was made, there was not a distinct provision made for this purpose. Streets running parallel should not be permitted to be formed within a certain distance of each other, and all cross roads and streets should be limited. A clause giving optional power to the council to withhold their consent in the formation of useless streets might certainly have been made, for although the existing provisions practically give the power, it is exercised to a very limited extent. The condition mainly regarded is the matter of prescribed distance from centre of road, and when this is observed the consent is often obtained. The rapid growth of the Metropolis renders it absolutely necessary to check the useless formation of new roads and streets, thereby adding to the complexity of the map of London, and the consequent expense and difficulty of administration in various directions.

SHADOWS.—XI.

THE shadow thrown by the Corinthian capital in Fig. 35 is found in the following manner:—We first find the shadow traces of the square inclosing the abacus at A A, *a a*. The projection of the points *a*, *a* will give us the cut-off angles. The intersection of the shadow lines from plan and elevation at B gives us the cast shadow of the volutes at B B. The projecting foliage B B is contained by the circle *b b b b* in plan. To obtain the shadow traces of this circle, we first find, as in previous examples, the tr of the containing square at B B. By the in section of the lines from plan and elevatio have the shadows of the foliage B B. The with that at C C, the shadow being at C C. is the point of shadow of the neck moulding shaft of the column.

In Fig. 36 we have the entablature of Corinthian order. We draw the shadow lin 45° from the corresponding points in both and elevation. Their intersection will giv the shadow points. The shadow of A *a*, at A A, B B, that of E E at E E, and G at A portion of the projecting modillons C *c*, K *k* receives the rays of light. A portion of shadows will therefore project beyond the sha of the cornice. The intersection of the projec of the line from C C on plan with that from elevation will give us the shadows of C *c* at C C, that of D *d* at D D, and that of K *k* at A portion of the shadow of F is thrown on to frieze at F.

This brings the series of elementary shad to an end. The student who has carefully lowed the preceding articles and examples sh now find little difficulty in rapidly solving ordinary problem of cast shadows. Nat shadows, and those of the interior of buildi &c., are more complicated; but a little pe verance and a careful attention to the ordi rules will soon enable him to overcome difficulty.

THE ARCHITECTURAL ASSOCIATI CONVERSAZIONE.

THE annual conversazione of the Architect Association, inaugurating the new sess took place at the Town Hall, Westmin on Tuesday evening, and passed off successf and smoothly. The decorations of the assembly hall, although not carried out on thing like so elaborate a scale as last year, effective and well arranged. Under a cano pavilion, immediately facing the entr corridor, the President, Mr. Frank T. Bagga and the committee received their seven hun guests. The stage was occupied by a band o Coldstream Guards, who played selection music throughout the evening. At the opp end of the hall Messrs. Woollams and Co.

Marylebone, displayed a great variety of their hand-made papers, among which we noticed the Kelvin, Halcyon, and King's College designs—the names of the artists were not given. Messrs. Hayward and Son, of Newgate-street, and Messrs. C. Hindley and Son, of Oxford-street, exhibited art furniture. Messrs. Jeffrey and Co., of Essex-street, Islington, showed on the stairs a large selection of wall-papers, many (including the Cockatoo, Genoese, Strasburg, and Chestnut Blossom), designed by Mr. Walter Crane, and others by Mrs. C. F. A. Voysey (a lotus pattern, executed in coloured lacquers), and Mr. Gemmel. Messrs. Pitman and Son exhibited gold and silver embroidery, Japanese in motif, and Messrs. Bontor hung some large Oriental carpets. The electric lighting throughout the building was executed by Messrs. Strode and Co., of Osnaburgh-street and St. Paul's Churchyard, and added not a little to the effect of the decorations. Messrs. Strode also had a choice display of art metal work. In the suite of rooms on the first floor of the building was exhibited the work executed by the students during the past year, including the drawings and designs submitted in the various class competitions. A large series of plates and drawings by the late Mr. John D. Sedding, forming part of the proposed memorial book, received much attention; while another interesting feature was the sketches by past masters of the water-colour class, including works by Messrs. G. H. Fellowes Prynne, W. Wonnacott, Edward Greenop, and E. H. Sim. Perhaps the room which attracted most interest was the long end one, where were hung, by permission of H.M. First Commissioner of Works, the competition drawings for the extension of the South Kensington Museum. The following is the

PRIZE LIST.

Architectural Association Travelling Studentship.—Kotari Sakurai.
Prize for Measured Drawings.—Not awarded.
Association Medal.—Alfred Cox.
Essay Prize or Medal.—1st, W. Wonnacott; 2nd, J. A. Pywell (special prize of five guineas).
Cates Prize.—H. G. Gamble.
Sketchbook Prize.—Not awarded.
Lectures on History of Architecture.—1st, £5 5s., J. Murray; 2nd and 3rd, not awarded.
Lectures on Construction.—1st, £3 3s., W. C. Waymouth; 2nd, £2 2s., H. G. Collins; 3rd, £1 1s., A. Stratton.
Elementary Class of Construction.—1st, £3 3s., C. E. Salmon; 2nd, £2 2s., A. Stratton.
Elementary Class of Ornament.—1st, F. A. Cameron Smith; 2nd, A. W. Jarvis; 3rd, H. Jefferis.
Class of Design.—1st, H. G. Lidstone; 2nd, J. C. Stockdale; 3rd, W. A. Lewis.
Class of Colour Decoration.—Time Sketches.—1st, J. D. Cooper; 2nd, M. Garbutt.
Class of Construction.—1st, £3 3s., H. E. Matthews; 2nd, £2 2s., J. C. Stockdale.
Advanced Class of Construction.—1st, £3 3s., John Murray.
Class for Study of Quantity Surveying and Specification Writing.—1st, £3 3s., J. P. Clarke; 2nd, £2 2s., W. B. Parry; 3rd, not awarded.
Session 1891-2.—Two scholarships, each of the value of £10 10s. per annum, and tenable for two years, eligible for students entering the first year: E. A. Rickards and A. J. Stratton.
Two scholarships, each of the value of £10 10s. per annum, and tenable for two years, eligible for students entering the third year: W. C. Waymouth and C. C. Winmill.

IRON PILES.

ENGINEERS who have had experience in the erection of lighthouses and bridges of iron on screw-piles, say that the life of iron in sea-water is considerable in those conditions. Solid wrought-iron piles have been known to stand with only a very slight corrosion. The experiments made by Mallet and others, to discover the amount of corrosion, prove that cast iron immersed in clear salt water is practicably indestructible, as the rate of corrosion is so slow that a whole century would not cause a greater corrosion than one-tenth of an inch. But the effect of less pure water must be taken into account, especially when wrought iron is used, and we have noticed a considerable corrosion in wrought-iron piles in piers constructed at many of our watering-places. At any rate, the safest plan is to specify solid wrought-iron piles in submerged sea structures, both with the object of discounting the effects of corrosion, and also of rendering the piles strong enough to resist sudden blows from vessels during stormy weather.

Messrs. Lumleys, the auctioneers, of 22, St. James's-street, who have carried on business for the last 38 years, wish it to be known that they have no connection with a firm of a somewhat similar name who have lately opened in St. James's-street.

WAYSIDE NOTES.

I THINK that an astronomical or meteorological observatory as well deserves the name of "building" as a hut for the protection of mountaineers. It is not exactly clear upon what grounds the promoters of the scheme for an Alpine Club hut on the Signal Peak of Monte Rosa claim that when erected the hut will be "the highest building in the world." Unless the proposed observatory on the summit of Mont Blanc is to be on the summit nominally only, and practically some considerable distance lower, the Alpine Club hut will have to do homage to the observatory, providing, again, that the latter enterprise, of the commencement of which we heard recently, is successfully carried through.

Information from Berne says that the "hut" is already being built, the cost being largely borne by the Italian Alpine Club, Queen Margherita of Italy assisting with a considerable sum. Further, we learn that Ferrari, the Italian engineer of electro-technical fame, proposes to construct the roof of the hut of copper, in order to protect it from lightning. The altitude of the building is stated as fifteen thousand feet. I trust that from time to time information may come to hand as to the progress of the works which cannot be but of interest to the architect and engineer of this country who has no opportunities for building huts or any other erections above the line of perpetual snow.

It was a frequent argument of my old master that if explorations were conducted in the bed of the Tiber at Rome, great and abundant discoveries would be made of relics of antiquity. I believe I have mentioned the fact before on some occasion connected with discoveries at Rome, and now we have an earnest of the truth of the proposition in the find made whilst excavations have been progressing for the Tiber Embankment. The fragments of a "fine marble statue of the best period of Greek art" have been discovered. The head is said to be of extraordinary beauty and well preserved, and so far as the fragments have been put together, an eminent sculptor and accomplished painter pronounce the statue to be a *chef d'œuvre* of Grecian art. It will be shortly exhibited to the public in the new Museum of the Baths of Diocletian, where other important objects lately found in the embankment works are preserved. It seems to me that before the works for the Tiber Embankment are completed, we shall have many such finds reported, and the new museum enriched by all kinds of relics of old Roman times. People say that the face of the earth is growing void of novelty, and nothing new is to be discovered. Fortunately, we have only just to go below the skin to find objects of interest that, paradoxical as it may seem, are new and novel just because they are so old.

Respecting the proposals of the Egyptian Government to provide a storage reservoir for the waters of the Nile, it has been finally determined to invite an international commission of engineers to meet at Cairo and advise as to the question. It is stated that the commission will be required to select a site to the north of Wady Halfa, or within the present limits of Egypt. The definite constitution of the commission will not be made known until the return of Sir C. Scott Moncrieff, who is expected to arrive in about a fortnight. Certain schemes, however, have been arranged to be put before the commissioners. Five such schemes will be submitted for their consideration. Three of these are associated with the names of (1) the late M. de la Motte, at Gebel Silielek; (2) Mr. Willcocks, at Assouan; and (3) M. Prompt, French administrator of Egyptian Railways, between Assouan and Halfa. All of these schemes contemplate the construction of dams and the "ponding-up" of the river in the valley itself. Mr. Willocks also advocates supplementing the supply by reservoirs in the Delta, on the edge of the Desert. Project No. 5 is that of Mr. Cope Whitehouse, and is based on the proposed restoration of the Raiyan Basin of Lake Moeris. The fourth scheme—unless Mr. Willocks' supplementary reservoir system is to be taken as such—is not stated. I only hope that the old ruins will be considered, and Philæ, at least, spared, although I am not so sodden in fanatical archæologicalism that I would not believe it to be better that all the old temples should be drowned out, so long as the result made a better country for the Egyptians and yet greater supplies of "corn in Egypt."

Carshalton Church is going to be restored, works being already in progress. A new chancel is to be erected, the Duchess of Albany having laid the corner stone thereof on Saturday last. All who knew old Carshalton Church as of yore, as the fane of "the prettiest village in England," according to Mr. Ruskin—and the place deserves every eulogy—and learn that £10,000 is to be expended on a new chancel and other alterations, will readily understand that the future Carshalton Church and the Carshalton Church of days gone by will be two very different things. A reporter of the ceremonial on Saturday last, says of the present building that "the whole structure has been altered and enlarged at such diverse periods that it has no particular style or harmony of its own." Therefore, I suppose our friend would argue, the new addition is not only justifiable, but desirable. Pitiable delusion! Carshalton Church, as I knew it, was one of those buildings where every addition made in times past—being modestly made, and without the expenditure of ten thousand pounds — adds to the charm of the whole; so that not only is it a parade of ignorance to say that Carshalton Church has no harmony of its own, but it is abundantly clear, to those capable of judging, that the building is, above all things, remarkable for harmony. Much credit is there in a design of one style only that has harmony of effect. The attribute comes naturally. On the other hand, it is no common thing to find harmony in a patchwork. Where we find it, therefore, we value it; and, apart from my own particular associations with Carshalton Church, I am sorry to learn that much gold is to be expended on an addition that must destroy the old harmony. Of course, it is only the few that can appreciate the beauties of old buildings like Carshalton Church as it once was. Here a window out of symmetry, there a door askew, a breadth of masonry here, and a patch of brickwork there. No formal nave and aisles, no "everlasting Early English pyramid," as someone wrote—Leeds, was it not?—and an absence of all the hackneyed features of Neo-Mediæval churches, appeals not to the average passer-by; while the whole glorious company of Philistines can appreciate a brand-new chancel, Perpendicular or otherwise; and failing even that insignificant amount of architectural knowledge, all men—Mammon itself—will be dazzled with the glitter of the ten thousand golden pieces.

Once more the question of Metropolitan improvements has been before the County Council, but with no results. Councillors refuse to entertain the schemes brought forward. Some explanation may be found in the fact that the council has very divergent opinions as to "betterment" and other questions concerning the manner of raising the funds for the payment of the cost of the improvements. Tuesday last saw the throwing-over of the recommendations for the several proposed improvements. An amendment on the recommendations of the Improvements Committee, to the effect that the Boziers-court scheme, which provides for the widening of Tottenham-court-road, should not be undertaken, was carried by 45 to 36 votes. The cost of this improvement is put down at £42,900. In like manner the recommendation as to the Strand improvements at Holywell-street was disagreed with, 54 as against 28 councillors voting that "the improvement was not necessary," and 43 to 35 votes negatived the recommendation of the committee in favour of a scheme for a new street from Tooley-street to Star-corner, Bermondsey. Even the consideration of the report on the water supply was postponed *sine die*, so procrastinating were councillors. GOTH.

At a meeting of the directors of the Blackpool Tower Company, held on Friday night, it was decided to proceed with the erection of the tower forthwith, according to Messrs. Maxwell and Tuke's plans. It was only originally intended to have the surrounding buildings ready for next season; but estimates for the erection of the tower proper are now being procured, and the work of erection will be pushed on with all possible speed.

The new schools, Taunton, are being warmed and ventilated throughout by means of Shorland's patent Manchester grates, the same being supplied by Mr. E. H. Shorland, of Manchester.

SOUTHAMPTON FREE LIBRARY—SELECTED DESIGN.

We reviewed the leading designs sent in for this work in our issue for Sept. 11th last, and to-day we illustrate both the first and second premiated plans. The elevations of the selected design speak for themselves; but we have omitted the front intended to face Bedford-road, as it is devoid of interest. The principal idea which marks the arrangement of the plan is certainly clever enough, though we understand several modifications are considered necessary. The referee, in his report, placed this design as unquestionably the best. Whether, taken as a whole, it will prove so satisfactory in execution remains to be seen. Without remarking upon the architectural character of the design as unnecessary here, we may be permitted to question whether, for so important and prominent a site, the façades are of sufficient elevation, or worthy of it. The chimneys from the committee room and living-room above are omitted in the drawings of the façade. That against the central turret would not improve that feature. Mr. A. E. J. Guy, of Southsea, is the author of this design, and the cost for the part at first to be erected is £3,500. The second premiated design is by Mr. S. R. J. Smith, of Lambeth. His elevations, though of more style, consist of a series of set-offs to accommodate a square arrangement to the irregular shape of the land, and this plan for one thing necessitates the news-room windows being located behind the building line of the adjoining property in London-road. The committee-room doorway is close to the caretaker's scullery, next the w.c. at the top of the circular staircase. The staff lavatories have to be reached by either passing through the librarian's room, or coming out into the open porch in front, and so passing down the caretaker's staircase into the basement. The reference library is entirely isolated from the lending library. We have already remarked upon the loss of space caused by the series of areas along the boundary of the site.

CARLISLE STREET SCHOOLS, SHEFFIELD.

This board school was opened lately, and consists of a main schoolroom and four classrooms on each floor, with the usual cloakrooms, teachers' rooms, lavatories, &c., accommodation being provided for a total of 720 children. There are two entrances for each sex, which are so arranged that the children can enter or leave any of the classrooms without passing through the main schoolroom. All staircases and corridors are lined with glazed bricks to a height of 5ft., and the internal fittings throughout are of pitch-pine, stained and varnished. The heating is by hot water on the low-pressure system, and the ventilation by Tobin's fresh-air inlets and air-pump ventilators on the roofs. All windows and glazed screens are also fitted with opening casements. There are playgrounds of ample dimensions, and in each is a covered playshed, with fountain. The walls are of stone from Crooke's, near Sheffield, with dressings from Grenoside, and the roofs are covered with dark Westmoreland slates and red ridge tiles. The building has been erected from designs submitted in competition by Messrs. Herbert Hodgson, A.R.I.B.A., and Jas. E. Benton, M.S.A., of Sheffield and Bradford, who, in the same competition, were also placed first for another school by Mr. Robson, the assessor, and were awarded the second premium by the Board. The general contractors were Messrs. T. Lowe and Sons, of Burton-on-Trent, and Mr. Jno. Laidler has acted as clerk of works. The drawing was exhibited at the Royal Academy this year.

MANTELPIECE, COPT HALL, MILL-HILL, N.W.

This fireplace is in the billiard-room recently added to Copt Hall, Mill-hill, N.W., for Mr. C. R. Hodgson. The mantelpiece and wainscotting are of oak, dull polished. The smoke-guard is brass repoussé. The repoussé is by the Nottingham Class of the Social Guild, from the designs of Messrs. Arthur Marshall, A.R.I.B.A., and George Turner, architects, Nottingham.

ARMS OF THE PODESTAS IN THE COURTYARD OF THE BARGELLO, FLORENCE.

The Palace of the Podestà at Florence, now better known as the Bargello, in the Via del Proconsolo, opposite the Badia at Florence, was famous as the palace of the chief criminal magistrate of the city, though subsequently, under Cosimo I., it was turned into a prison at the time he abolished the office of Potestà and assigned the palace to the Bargellor, or Head of the Police. The law enacted, when the position of Potestà was first created in 1199, that their officer should be always a foreigner, a noble, a Roman Catholic, and a Guelf. In 1250, however, a Ghibelline named Ranieri de Montemurlo was elected, which caused an insurrection of the people, who chose a new governor, and fortified the old tower of the Boscoli and the adjoining buildings at his residence. The chief power continued in the hands of the Potestà till 1462, when it was restrained by a tribunal called Giudici alla Ruota. The greater part of the palace is due to Arnolfo di Lapo, the son of Lapo and pupil of Cimabue. He continued it after two Dominican monks named F. Sisto, of Florence, and F. Ristori de Campi had commenced the building, which is said to have been planned by a German architect, who was nicknamed Lapo (an abbreviation of Jacopo), whose family name was never known. Upon the outside of the older tower, facing the Via del Palagio, were frescoes of the Duke of Athens and his associates, hanging, but they are no longer visible. The bell within, called the *Montanara*, obtained the name of *La Campana delle Armi*, because it was the signal for citizens to lay aside their weapons and retire home. Afterwards it tolled the condemned man's hour of execution. The street below the Bargello witnessed on August 1, 1343, one of the most frightful scenes of Florentine history. The Duke of Athens had taken refuge in the fortress, and the members of the noble families of Florence, Medici, Recultai, and others, who had suffered from his tyranny, were besieging him. They demanded, as the price of his life, that the Conservatore Guglielmo d'Assisi and his son, a boy of eighteen, who had been the instruments of his cruelty, should be given up to them. Forced by hunger, he caused them to be pushed out of the half-closed door to the populace, who tore them limb from limb, hacking the boy to pieces first before his father's eyes, and then parading the bloody fragments on their lances through the streets. Other scenes of a possibly less tragic character could be enumerated in connection with the history of the proud palace of the Pretorio during the continued changes which occurred in that indomitable, excitable, and yet severe and obstinate community of Florence. By degrees the palace was extended towards the east, the portico, the loggia, and the adjoining halls, which were slowly proceeded with till 1316, when the works were pushed on with greater activity. To the six guilds was added a seventh—a kind of democratic aristocracy under the title of "Popolo Grasso," which daily increased in power and influence. The nobility and the "Popolo Munuto" were entirely dependent upon them. The "Signoria" in their pride went so far as to make King Charles Robert of Naples (1313) one of their members. He oppressed them, first through his agents, and then through his son, Duke Charles of Calabria, until they intrusted Walther of Brienne with a kind of dictatorship. He was carried through the intensely picturesque courtyard (from whence our illustration is taken to-day) into the palace on the shoulders of the nobility. The great staircase built by Agnolo Gaddi early in the 14th century, forms the most conspicuous feature in this beautiful courtyard, which was the theatre of many of the principal events that desolated the city, and also witnessed all the executions of capital sentences since that time. Niccolò de' Lapi, the hero of Massimo d'Azeglio's novel, was beheaded near the well in the centre of the courtyard in 1530. The arms of the Duke of Athens hang near the entrance, followed by those of the two hundred and four Podestàs who ruled afterwards in Florence. The few we have chosen for illustration are typical of the rest, and are chiefly of 15th-century date. They are situated on the spandrel between the two archways over the first pier next the staircase below the upper loggia, which was built by Orcagna, one of the architects of the Duomo at Florence, and probably the designer of the frescoes in the Campo Santo. The palace now forms the National Museum, and has been used for this purpose since 1865. It is open daily from ten to four, and on Sundays is free. Several general drawings of the Podestà Palace will be found published in the Building News for July 4th, 11th, 18th, and 25th, and for August 1st, 1873.

A COUNTRY PARSONAGE, FROM THE ROYAL ACADEMY EXHIBITION.

The whole of the exterior brickwork is intended to be built in red brick of a light colour; the stone-work to centre portion by principal entrance to be of yellow Mansfield, the half-timber work to be of English oak creosoted, the roofs being covered with Broseley tiles of a dark colour. The architect is Mr. F. H. Tulloch, A.R.I.B.A., of Hampstead.

CHURCH OF ST. OLAVE, OLD JEWRY.

This church, which has been a mere carcase for the last four years, will shortly disappear in favour of a block of City offices. The churchyard will, it is believed, be laid out as an open space, while the vacant site on the north side of the yard is reserved for a rectory-house for the now united parishes of St. Olave, Old Jewry, and St. Margaret, Lothbury. The better-known east front in Old Jewry is pedimented, with a triple-light east window surmounted by three lunettes, the lights separated by Corinthian pilasters. Over the arched centre light is a projecting drum clock. Although one of the plainest of Wren's churches, yet the mouldings are refined, in a good state of preservation, and worthy the notice of the student of the English Renaissance. The sketch from Ironmonger-lane shows the tower unmistakably Gothic in outline, but with Classic detail. The site, as reported in the Building News of July 24th (*q.v.*), was sold at the rate of about £9 per square foot.

W. Clarke Ashworth.

CHIPS.

A clock with gravity escapement, compensated pendulum, striking the hours, and showing time on one dial, 5ft. in diameter, has been erected in the parish church, Inkberrow, by J. B. Joyce and Co., of Whitchurch, Shropshire.

A partnership has been entered into by Mr. Arthur H. Mackmurdo, Mr. George Hornblower, and Mr. E. Stanley Walters, architects, under the style of Mackmurdo, Hornblower, and Walters, and their places of business are 94, Charlotte-street, Fitzroy-square, W., and 15, Lord-street, Liverpool.

The newly-appointed burial board for Dundalk have appointed Mr. Gaskin as their architect for the cemetery, the commission to be five per cent. on the structural outlay.

Albany-street Congregational Church, Edinburgh, was reopened on Sunday after internal alterations and decorations carried out by Mr. A. Hutton, Dundas-street, Edinburgh.

New board schools at Beaumont Park, Acton, were opened on Saturday. They accommodate 1,029 children, and cost £9,800

THE COUNTY COUNCIL AND THE SEWAGE OF LONDON.

HOWEVER "urgent" a road may be between the Strand and Holborn—writes Mr. Edmund Kimber, member of the Plumstead District Board of Works—it is not absolutely necessary, at any rate at present; but that which is immediately and absolutely necessary is the purification of the Thames. Though in 1855 the late board were ordered by law to get the sewage out of the Thames, they never did so. Their sewers were a mere stopgap and pretence, and to-day it is foul'er than ever. At any moment the council can be criminally prosecuted for the frightful nuisance they create at Barking and Crossness. Their precipitation business there is folly itself. They carry sludge out to sea at great expense, when they might put it on land close by and raise it and increase its value tenfold, and they propose to spend £8,000,000 only to increase this gigantic evil lower down the river. Never before was there such fatuity and such gross ignorance of the first principles of sanitary science. They ignore the Royal Commission of 1884, and though the late board were condemned by Lord Herschell's committee, they yet follow in its wake.

It matters not that the Houses of Parliament are built on the banks; 34 storm overflows now carry sewage beneath the nostrils of the members and breed microbes *ad nauseam* within their walls. Lord Palmerston in days gone by waxed eloquent over Thames filth, but then it was nothing in comparison with the present open and navigable sewer between Greenwich and Gravesend, where the ordure of 5,000,000 of human beings is daily deposited. Never before in the world's history was there such a gross violation of all laws, both human and divine. That the first municipality in the world should be guilty of a foul and beastly act on an enormous scale, for which common sailor boys and watermen and lightermen are fined every day, is past man's understanding. It only shows that you have only to make ignorance colossal to make it venerable.

Between the Isle of Dogs and Purfleet there are no less than 5,920 acres of unprofitable marsh land, which, with the precipitated sewage sediment, could be easily raised on the average 21ft. high. This would take 600,000 tons annually for 445 years, but at the present rate of the increase of London 100 years would see it covered. But beyond Purfleet there are many more thousands of acres where valueless land could be made extremely valuable — land which for agricultural and horticultural purposes would never require any manure, which would form parks and gardens for the people without end, which, while providing a solid embankment for the river, would create a splendid carriage-way for commerce and business along its banks, and make building plots on the land and railway side which would cover all the cost. Never was there such a magnificent opening as the marshes now present to a bewildered and forlorn and sewage-laden Council. They make a frightful loss where they might and could and ought to make a fruitful profit. It requires no more legislation. The law as it stands fully authorises, and, indeed, enforces, all that is required. The Council are distracted with multifarious duties of secondary necessity and importance; but they have forgotten that the health and cleanliness of London is their first, and that everything must give way before an evil which saps the vitality of Government working in £100,000 a year, and the numerous trac the river by another £200,000 a year- which converts the Thames into a hu and makes it the curse and reproach of th live on its shores.

No wonder that the Peninsular and Company, the South-Eastern Railway, t Committee of the docks, all the local authorities, and the London Chamber merce are now joining in a strong remo to the Government and the Council u unparalleled and unprecedented nuisance

ROYAL VISIT TO LUGWARD WORKS, WITHINGTON.

ON Wednesday week Messrs. William and Son, the well-known Ecclesiast Art Tile Manufacturers, were honoured visit from H.R.H the Princess Mary A Duchess of Teck, H.R.H. the Princess Mary of Teck, and H.S.H. the Duke of T

The royal visitors were accompanied Michael Biddulph, M.P., Lady Elizabe dulph, and a distinguished party, numbe all fourteen, who were paying a visit Lady Emily Foley. The party were co in her ladyship's carriage, and a drag dr four splendid horses, driven by the own Booker. The Duke and Duchess and par conducted by Mr. Godwin and the manag the works, and the different processes manufacture of encaustic and other tile fully shown and explained, the royal appearing to be much interested and with what they saw. The manufacture inlaid or encaustic tiles was watched very and was a source of much interest, so that the Duke, Duchess, and the Princess inscribed their names on the backs of the tiles they had watched being made, an will in due course be forwarded t Highnesses. Messrs. Godwin and Son's chimney pieces, with tile interiors, we much admired, several sets eliciting praise. The royal party also ma much interest in the copies of the English ecclesiastical tiles, the Duke esp desiring to take with him some spe similar to those he had seen in the Malvern. The Duchess and the Princes also desired some of the tiles which th seen and admired to take away with th souvenirs of their visit—a request which w readily granted.

On the completion of the visit, which nearly two hours, the Royal party signe names in the visitors' book, and expressed Godwin the great pleasure the visit ha them. Shaking hands with Mr. Godwi with Mr. Pickerill, they left for Stoke amid the cheers of the workpeople.

UNIVERSITY COLLEGE, LONI SESSION 1891-92.

FACULTY OF ARTS AND LAWS.—APPLIED Lecturer, HUGH STANNUS, F.R.I.B.

TWO courses, each consisting of ten l will be given in the Slade Libr Tuesdays and Thursdays, from 5 to 6 p.m

A. ORNAMENT AND ITS APPLICATIO Elements, (*b*) Principles, (*c*) Application. will extend from the 13th of October to t of November, 1891, both inclusive. *generally* useful to artists, it will have reference to the needs of architectural stud

B. DECORATION.—(*a*) Subdivision of pla face on walls, &c., (*b*) subdivision of surface on cupola, &c., (*c*) colour trea (*d*) storiation, or the application of figure su This will extend from the 17th of Nove the 17th of December, 1891, both inc Though generally useful to architects, specially intended for artists. The lectu attend fifteen minutes before each lect supervise notes and advise. Fees: For A £1 1s.; for A and B, £1 11s. 6d.

CHIMNEY COPINGS.

THE protection of chimney stacks again weather is very necessary. In e situations a brick chimney-stack soon signs of decay; the weather destroys the joints, which become disintegrated, and cr leaving a serrated edge of brickwork.

ng of brick chimneys is particularly liable to percolation of rain, and speedily destroyed. of the best inventions to meet the last-tioned evil is the use of terracotta cappings, ch protect the brickwork from the weather. Chicago firm is now manufacturing salt-ed terracotta cappings to suit various forms himney-tops. These resemble copings made ow to fit over the upper course of brickwork. ner-piece copings are made for the angles, the external mitre cast in one piece, and joints are of socket construction, a flange of piece projecting over the joint of the adjoin-piece, by which means the joints are covered hat no rain can pass through them. The sec-of these copings consists of a level top, the le of which is in a line with the inside of k flue, then a bold splay, and at the bottom a ical face with inner flange, which latter rests he brick course. This chimney coping will a solid and desirable finish, and as it can be ilded to any section, it may be made to me an ornamental appearance.

BOOKS RECEIVED.

rinciples and Practice of Plumbing, by S. VENS HELLYER, with illustrations (London: rge Bell and Sons, York-street, Covent-den.) This is one of the useful series of "echnological Handbooks" issued by George l and Sons, and edited by Sir H. Trueman od, secretary of the Society of Arts. Mr. llyer is an authority on the subject of plumb-, and his former treatises are known to many ur readers for their practical value. In this e handbook the student of the art and the lligent young plumber will find a useful mmary of every branch of the trade. The s and manufacture of lead pipes and castings, s of lead sheets, the tinning of metals, mbers' solder, lead burning and laying, joint ing, and other operations are treated in some il. The chapters on "lead laying" are full, make a very useful section of the work. v architectural students and plumbing rentices know much about the technical rations necessary in laying flats and ters, valleys, hips and ridges, dormer eks, flashings, &c. The points to be attended n making lead coverings to stone cornices, in ossing-up" roof cesspools, angle-soldering, in ming "drips" on flats or gutters, in setting-the rolls on flats, laying gutters, in executing s and ridges and wood and seam rolls, flash-s, "secret" gutters, &c., are noticed and strated by diagrams. These processes are merely defined, but the manner the lead is out, cut, and manipulated for these various poses is practically explained. The general initive and descriptive mode of writing on se subjects are useful to general readers; but young plumber and the student of archi-ture or building wants to know the *modus randi* involved in actually laying and dressing sheets over domes and ogee roofs, and what ths of "lay-downs" and "stand-ups" of there should be on "step-flashing." Many ails are dealt with not found in other rks on plumbing we have seen. The prac-of "joint-making" is well illustrated, elbow-joints and pipe-bending. Non-ansing and self-cleansing traps come in for share of notice, and the good and bad traps illustrated. The principles of trap construc-n are clearly laid down, and the author fully plains and illustrates the loss of "water seal" raps. The concluding chapters give a fair *umé* of the principles of soil-pipe disconnection ventilation, the methods of laying house-ins, the varieties of closet apparatus, baths lavatories, disconnecting and ventilating ps. As a manual of plumbing practice in its ious branches, Mr. Hellyer's little book will a useful addition to the shelves of the archi-t's technical library, and ought to take a place technological instruction in our science ools.

The subject of "back-to-back" houses was dis-sed at the annual provincial meeting of the tional Society of Medical Officers of Health, at eds, on Saturday. Such buildings, so usual in North of England, were strongly condemned as ntially insanitary and prejudicial to the health he occupants, and it was urged that measures uld be taken to obtain their conversion into hrough" houses, and to prevent the erection of ellings of this description in future.

Building Intelligence.

ABERDEEN.—The town council unanimously adopted on Monday the scheme for the extension of Marischal College buildings. The estimated cost of the improvements is £60,000. The plan shows an extension of the college by building an addition to the north and south wings, and a new building to front Broad-street. The front building will have an archway in the centre 40ft. wide. The matter was remitted back to the improvement committee in order that they may arrange the details of the scheme.

ABERGAVENNY.—The additions to the joint counties' asylum at Abergavenny have recently been completed and occupied. The extension provides infirmary wards (for males) on the ground and first floors, which will give accommodation for 54 patients, and also a lavatory block, ten single wards, and the usual attendants' rooms. The new work harmonises with the adjoining building, the walls being built of hammer-dressed Gilwern stone, with Box stone dressings. Considerable difficulty was experienced with portions of the foundations, on account of the presence of springs in the adjoining rising ground. To master this obstacle a well was sunk, with land pipes laid in various directions, which intercepted the water. This was turned to practical account by being conducted into a tank, holding 60,000 gallons, erected some little distance from and below the level of the new block, which is three stories in height. The work has been carried out by Mr. John Linton, contractor, of Newport, under the supervision of Mr. Alfred Swash, M.S.A., of Newport and Abergavenny, with Mr. William Davis as clerk of works. The cost was £3,500.

BARNSLEY.—A school to accommodate 300 boys is in course of erection at Hoyland Common, near Barnsley, for the Hoyland Nether School Board, from designs (which were selected in open competition) of Mr. Fredk. W. Dixon, architect, of Oldham. The plan provides a large school-room, divisible by revolving shutters into three class-rooms, each for 60 scholars, and two other class-rooms for 60 each. Cloak-room and lavatories are also provided. A covered play-shed, 50ft. by 24ft., is built at the rear of main building. The school is faced externally with pitch-faced parpoints from Brighthouse, with dressings of local stone, and roofed with Vellenheli slates. A salt-glazed brick dado runs round all inside walls, which are finished above with plaster. The whole of the joiners' work is of pitch-pine, the roof principles of Quebec pine, and the flooring of cloak-room and corridors will be of concrete. The heating will be by low-pressure hot-water. The contracts, including heating, lighting, ventilating, forming playground boundary walls, amount to £2,460 11s. 8d., and are being carried out by local tradesmen under the architect's supervision.

DRUMCATTON, DUNDALK.—The R.C. church at Drumcatton, near Inniskeen, has just been restored and remodelled. The church was built a century since. In the west gable is now a fresh entrance with Gothic windows above. All the windows have been altered, the old frames being replaced with new ones. The walls have been cleaned down and plastered in cement, heavy mouldings being placed over all door and window openings, and the entire marked in imitation of stonework. The galleries were altered so as to give more accommodation. A stained-glass window, measuring 14ft. by 9ft. 6in., has been placed in the east gable, and immediately over the principal altar. Three new altars painted in light colours and gold have been erected. The sacrarium floor is laid with Minton tiles. A communion rail, in polished pitch-pine, with lattice-work relieved in gold, has been added, and a sacristy has been built. The new woodwork has been stained and varnished, and seats are provided for every part of the church. A new rubble wall has been built, and a considerable portion of new ground added to the cemetery. The work has been carried out by Mr. Thomas Clarke, builder, of Dundalk, from designs by, and under the superintendence of, Mr. James Gaskin, architect, Dundalk.

FENTON, STAFFS.—To celebrate the jubilee of the parish church at Fenton, it was decided in 1889 to rebuild the structure. The plans and designs for the new church were prepared by Mr. Charles Lynam, of Stoke-on-Trent, diocesan surveyor. The work has been carried out, and the new church consists of a nave and six bays, with clerestory and aisles, and north and south porches; a chancel with a chapel on the south side and a clergy vestry on the north; also a north transept, containing a choir vestry and an organ-chamber. A tower is designed for the west end of the nave, and the foundations for it have been put in, but this feature has not yet been erected. The church will accommodate about 1,000 worshippers. The walls throughout are of brickwork, with facings of the same material, except that the interior of the chancel is of ashlar stone. All the dressings are of Hollington or Wall Grange stone. The style of the church is English Decorated, and was dictated by the requirement of the re-use of prominent features from the former church. The cost of the building, exclusive of the tower, will exceed £6,000. Messrs. H. and R. Inskip, of Longton, were the contractors. The consecration of the new church took place on Saturday afternoon.

GLENALMOND COLLEGE, PERTHSHIRE.—The architect of the new wing to this institution, the memorial stone of which was laid by Mr. Gladstone last week, is Mr. George Henderson, of Edinburgh, whose father, the late Mr. John Henderson, designed the existing college. The buildings are in the form of a quadrangle, with the main front to the west, and extending on each side of the square about 275ft. Freestone of a brownish tint, from a local quarry, was used in the building, and after some forty or fifty years' exposure it has now all the appearance of age. The style of architecture adopted is that of collegiate buildings of the 15th and 16th centuries. In the centre of the western wing rises to a height of about 90ft. a massive square tower, with octagonal staircase turret. Underneath is a large archway leading to the quadrangle. The south side of the quadrangle just commenced will only consist of a cloister, giving access to the chapel. The new wing, connecting the hall and chapel, completes the eastern side of the quadrangle, forming a continuous elevation of about 150ft., and contains classrooms on the ground floor, with dormitories on the two upper floors.

LEEDS.—The foundation-stone of St. Aidan's Church, Roundhay-road, Leeds, which is being erected as a memorial to the late Dr. Woodford, Bishop of Ely, a former vicar of Leeds, was laid on Saturday by the Bishop of Ely (Lord Alwyne Compton). The church, which will be of the Basilican type, will be constructed from plans prepared by Messrs. Johnson and Crawford-Hick, architects, Newcastle-on-Tyne. It will be built of red brick with stone dressings. The nave will be 152ft. by 40ft., with the aisles 11ft. in width. The tower will be in the north-west corner, and the west end will be terminated by an apse, which will be used as a baptistery. The east end will also have an apse, with vestries on the north side, and an organ chamber and song gallery above the two easternmost arches on the north side. On the south side a chapel will be provided, so arranged that it can be used with the remainder of the church when the full space is required. Accommodation will be provided for 1,000 persons. The estimated cost is £10,000.—The improvements about to be undertaken in suburban Leeds by the North-Eastern Railway Company will necessitate the pulling down of a large number of cottages at present in the occupation of the working classes. According to the provisions of a recent Act of Parliament, corporations or companies taking such properties by compulsion cannot demolish them until other houses have been built in their place. The plans for these new houses, besides having to be approved by the local authority, have to be passed by a Government department after a public meeting of inquiry held by an inspector from the Local Government Board. The North-Eastern Railway Company propose to build in the neighbourhood of Pontefract-lane, on the west side of Clark-lane, about 170 houses, in place of those which it is proposed to pull down. From experience of the Local Government Board, the company are aware that they will not be allowed to erect back-to-back houses, and therefore it is intended to build what will be model working men's through houses, each having a kitchen, scullery, a separate back yard, and three bedrooms. After their completion, the company will be obliged to keep the houses in its hands for twenty-five years.

LIVERPOOL.—On Saturday there was opened a

building in the city specially constructed and furnished for providing technical instruction to evening students. From front to back the length is 121ft. and 21ft. wide. There are four stories in height to Islington, and two stories high at the back, fronting to Islington-place. The front elevation is Classic in treatment. The electrical laboratory is 67ft. by 18ft., accommodation being provided for about 30 students doing practical work. In the lecture-room, devoted to brick-work and masonry, at the rear, which is 38ft. by 19ft., there are provided benches specially made, tools, and materials for modelling. The carpentry room, fronting to Islington (31ft. by 21ft.), will be under the direction of Mr. F. O. Cresswell. The modelling-room will be under the direction of Mr. J. Hargreaves Bond. The plumbers' workshop in the basement is 23ft. by 20ft., and approaching from the main stair. The general contractors were Messrs. J. Henshaw and Sons, of Chatham-street, who have carried out this work under the direction of the architect, Mr. J. Francis Doyle, Harrington-street, Liverpool.

Morton, Gainsborough.—At a cost of between £9,000 and £10,000 a new church has just been completed at Morton, Gainsborough, the consecration of which, by the Bishop of Lincoln, took place on Saturday. The old parish church of St. Paul, though only built in 1845, with nominal accommodation for 307 worshippers, was inadequate for the increased congregations, and Sir H. B. Bacon offered, if the parish would raise £850, to bear the entire remainder of the cost of rebuilding the church. The old church has been pulled down, and with the exception of the tower, which was left standing, an entirely new edifice has been erected on its site. Built of Ancaster stone with a slated roof, it consists of the old tower, chancel, side chapel, transepts and nave, with aisles. The architects were Messrs. Somers Clarke and Micklethwaite, of Deans-gate, Westminster; and the contractor, Mr. Halliday, of Stamford.

Southwark. — On Saturday afternoon the foundation-stone of a new church in Redcross-street, Borough, was solemnly laid by the Bishop of Southwark. The church will be 130ft. by 42ft. internally. There are no aisles, but a passage-way through the buttresses will serve for processions, and give access to the seats. The sanctuary will be raised several steps above the floor and be surrounded by a low parapet wall. It will be terminated by a semicircular apse, in the chord of which will stand the high altar of plain stone under a baldacchino of simple character. The entrance will be through a deep porch, giving access both to the church and the baptistery. The latter will be lower than the general floor-level, and reached by descending several steps, in accordance with the Roman custom. The church will be built entirely of brick, and will be of substantial construction. It will be of an extremely simple and severe style of Romanesque. There will be accommodation for 700 persons, and the cost, including a large presbytery and sacristies, will be about £7,000, £1,000 of which has had to be spent in foundations, owing to the nature of the site. The architect is Mr. F. A. Walters, F.S.A., of Westminster.

Swansea.—The town council, at a special meeting held on Thursday in last week, decided, by 18 votes to 14, to expend a sum not exceeding £20,000 in rebuilding and improving the market in Oxford-street, and ordered the architects of the plan selected in competition (Messrs. J. Buckley Wilson and Glendinning Moxham, of Swansea) and the borough surveyor to modify the designs so as to come within that limit. The town clerk was further instructed to apply to the Local Government Board for sanction to borrow the money necessary to carry out the work. The estimate of the successful architects for the entire scheme, which was illustrated by a double-page plan and perspective in the Building News for Nov. 8, 1889, was £27,000. The reconstructed market will have frontages to Oxford-street and Union-street, which are to be built of red Avon bricks with Bath stone dressings. The principal entrance will be opposite Portland-street; there are two minor entrances in Oxford-street and two in Union-street. The whole of the area of the present site is to be covered, and by economising space the accommodation will be increased by one-ninth. The architects strove to give the greatest accommodation without adopting galleries, and have designed one main, imposing avenue. There are to be 80 butchers' stalls, a wholesale meat market, a fish market, three rooms for officers, weighing, parcels, refreshment, and retiring rooms.

COMPETITIONS.

Llangefni Drainage and Water Supply.—A few months ago the Llangefni (Anglesey) Local Board offered two premiums of £20 each for the best schemes of drainage and water supply for the town, with the result that six engineers sent in schemes. The board have decided in favour of the schemes prepared by Mr. C. H. Beloe, of Liverpool, who will, therefore, be awarded the premiums subject to the approval of his schemes by the Local Government Board. The board also decided to employ him as their engineer if his schemes be adopted.

Port Talbot Schools.—The competition for these Welsh intermediate and technical schools has been settled, we hear, in favour of Mr. T. P. Martin, of Swansea, whose design has been awarded the first premium. The second prize is taken by Mr. R. Williams, of London. No schools of this class have yet been erected.

Stock Prize.—The Council of the Society of Arts offer, under the terms of the Stock Trust, a gold medal, or a prize of £20, for competition amongst the students of the Schools of Art of the United Kingdom, at the Annual National Competition held in 1892. The prize is offered for the best original design for architectural decoration, by means of painting, stucco, carving, mosaic, or any other method, such as that for the side of a room or hall, a ceiling, or the apse or side of the chancel of a church. The design must be on imperial sheets, and must be accompanied by drawings of details on separate imperial sheets. Mere patterns or pieces of painting and modelling, without the mouldings or borders necessary to make up a complete decorative scheme, will not be taken into consideration. The work is to be that of the previous school year. The designs are to be submitted in the usual manner to the examiners, at the Annual Competition (April, 1892) of the Department of Science and Art. Competing designs must be marked, "In competition for the Stock Prize," in addition to being labelled and staged according to the regulations of the Department of Science and Art.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

The Glasgow Institute of Measurers.—The eleventh annual meeting of this institute was held in the Christian Institute on Monday afternoon. Mr. Robert Scott, I.M., the president, occupied the chair. There was a good attendance of members. It was reported that there are now forty-four members upon the roll. The funds of the institute amount to £173 15s. 9d. Reference was made to the rules for the measurement of brick, slater, and plumber works, and it was intimated that these have been advanced a stage, but are still under the consideration of the joint committee. The office bearers for the ensuing year are:—President, Robert Scott, 115, Wellington-street; vice-president, Wm. Howatt, 146, Buchanan-street; secretary and treasurer, Colin Young, 113w, Regent-street; auditors of professional accounts, David Robertson and James D. Herbertson. Other members of council are:—James Howatt, John Dansken, Alexander Knox, John H. Ramsay, Robert Reid, John Morrison, and John Muirhead, &c.

The "Special Shipping Issue" of the *Cabinet Maker and Art Furnisher* contains a portrait of Mr. A. Ritchie, of Steven Bros. and Co., of Upper Thames-street, and some illustrations of the manufactures of that noted firm. We also gave Mr. Ritchie's portrait in our last "New Year's Number."

The completion of St. Catherine's Church, Canton, Cardiff (including chancel and choir, south chancel aisle, organ chamber, and vestries), is about to be commenced. Plans have been approved of, and tenders received, so that this long-looked-for improvement is about to become a reality. The architects are Messrs. Kempson and Fowler, Llandaff.

Mr. John Hutchison, R.S.A., Edinburgh, has just designed and executed in Sicilian marble a baptismal font for St. Salvator's, or the College Kirk of St. Andrew's.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opin our correspondents. All communications sho drawn up as briefly as possible, as there are claimants upon the space allotted to correspondei

It is particularly requested that all drawings a communications respecting illustrations or literary should be addressed to the EDITOR of the Bu News, 332, Strand, W.C., and not to members staff by name. Delay is not unfrequently oth caused. All drawings and other communicatio sent at contributors' risks, and the Editor wi undertake to pay for, or be liable for, unsought con tions.

Cheques and Post-office Orders to be made paya J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part United Kingdom; for Canada, Nova Scotia, and the U States, £1 6s. 0d. (or 6dols. 30c. gold). To Fran Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brit £1 10s. 4d. To any of the Australian Colonies or Zealand, to the Cape, the West Indies, or Natal, £1 6

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Adve ments, Public Companies, and all official advertiser is 1s. per line of Eight words, the first line counti two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscella and Trade Advertisements (except Situation adve ments) is 6d. per line of eight words (the first counting as two), the minimum charge being 4s. 6 40 words. Special terms for series of more tha insertions can be ascertained on application to the lisher.

Front Page Advertisements 2s. per line, and Parag Advertisements 1s. per line. No front page or parag Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vac or "Situations Wanted" is One Shilling for Twe four Words, and Sixpence for every eight words *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reac office not later than 3 p.m. on Thursday. Front advertisements and alterations in serial advertise must reach the office by Tuesday Morning to secure tion.

NOTICE.

Bound volumes should be ordered early (price T Shillings each), as only a limited number are up. A few bound volumes of Vols. XL., XLI., XL XLIX., L., LI., LII., LIV., LVIII., LIX., and may still be had, price Twelve Shillings; all the bound volumes are out of print. Most of the back bers of former volumes are, however, to be had si Subscribers requiring any back numbers to com volume just ended should order at once, as ma them soon run out of print.

John Jas. Downes. (The Courts have decided tha architect has no right to the drawings. The point never been tested, as it should be, by an appeal t highest Court, but such is the law so far. You search our back vols. yourself for the cases.)—M (We know nothing about the conditions. You get information by addressing the Secretary Conduit-street, W.)

Correspondence.

THE ARCHITECT OF THE FUTUR

To the Editor of the Building News.

Sir,—After perusing the "Brown Book the A.A., and thinking of the happy time w all architects shall be well trained, examined, registered, I receive a fearful shock by receipt of the inclosed.

Messrs. * * * * * * and Co., Auctioneers, Surve and Estate Agents, Architects and Quantity Surve Mortgage Negotiators, Builders, Decorators, and San Engineers. Furniture Removed and Warehoused. mates Free.

I have heard a great deal of the furniture s in North-West London, but never expected not only can you obtain designs of cathed town-halls, and mansions, but even bill quantities. It is said that one of the part wishes to become a Fellow of the Survey Institution, and I commend the above advert ment to the notice of the Council of that bod I am, &c. Surveyo

THE BLACKPOOL TOWER.

Sir,—We might forgive a little vulgarit the Notes of your Wayside correspondent, when his pleasantries cause injury to the sha holders in a public company, it is time for statements to be corrected.

] the first place the Justices have not refused
l nse to the buildings. There are at present
w icenses attached to the site, and these will
e. full operation until next September, and
e hairman of the Justices made a special
o st to the Press that they should not assume
n the license had been refused, for when the
r oters came before them with the buildings
p leted the application should receive their
r favourable consideration.
nder these circumstances our directors on
ay night passed a resolution to proceed with
rection of the tower immediately, and the
acts will be, we expect, placed within a
ight, and the works proceeded with at once.
e are sure you will excuse this contradiction,
when a statement is made in a serious pro-
ional journal like your own, it is difficult for
le to imagine you are purpitrating a joke.—
MAXWELL AND TUKE.
are, &c.,
, Princess-street, Manchester, Oct. 5.

"Goth" should certainly have been more
ful with his facts. As to the "vulgarity,"
hardly more heinous to "purpitrate" a joke
bad spelling—it is Messrs. Maxwell and
e's own.—ED.]

THE GLENBURN HYDROPATHIC COMPETITION.

IR,—I have seen to-day for the first time the
arks on the Glenburn Competition, in your
ber of the 18th ult., in which reference is
le to a paragraph in a Glasgow evening
er. The statements in this paragraph, so far
hey are intended to refer to me, do not con-
a word of truth. I should feel obliged if
would insert this contradiction.—I am, &c.,
T. L. WATSON.
08, West Regent-street, Glasgow, Oct. 3.

FORMATION OF NEW ROADS.

IR,—You recently reported the decision in the
e of a road at Highbury, when the formation
road at Herne Hill was mentioned, and as
s is a most extraordinary instance of evading
law details may not be without interest to
ir readers. The new road starts from Half
on-lane and runs just sufficiently far to enable
ses to front the land with other houses at the
k.
This short road and the length at an acute
gle to it, nearly parallel to Half Moon-lane, is
ft. wide, but it discharges into a 4ft. footpath
dened to 22ft., so that this street is not 40ft.
roughout its width, nor can it be, as the
joining land is let on lease for some years, and
e freehold belongs to Dulwich College.
A more remarkable case of road formation can-
t be found in the county of London.—I am,
,
OBSERVER.

CHIPS.

The temperance-hall at Walsall was reopened on
nday night after alterations and decorations
rried out by Mr. Roden, of Wednesbury.

Mr. George Wallis, who for twenty-eight years
s been Senior Keeper of the South Kensington
useum, and for more than forty years connected
th the promotion of art education in this country,
s resigned his appointment. Mr. Wallis delivered
s first lecture advocating State assistance for Art
early as 1839.

The Archbishop of York will reopen Selby Abbey
urch, after restoration from Mr. J. Oldrid Scott's
ans, on Tuesday next.

On Saturday the members of the Glasgow Archi-
ctural Association visited the Coats Memorial
urch at Paisley, upwards of thirty attending.
r. Hippolyte J. Blanc, of Edinburgh, the archi-
ct, conducted the party over the church, which is
t yet finished, and described the special features
d peculiarities of construction and arrangement.

The Newton Heath Branch Library was formally
ened last week by the Mayor of Manchester
fr. Alderman Mark). The rooms occupied by the
rary are in the building erected as offices by the
d local board (now merged in the Manchester Cor-
ration), a portion of which, used as a public bath,
s already been opened.

The new Wesleyan Centenary chapel at Wit-
ring, South Lincolnshire, was recently opened.
he building is fitted up with pitchpine seats,
d will accommodate 100 worshippers. Mr.
. Scholes (Stamford) and Mr. W. Hilliam (Stam-
rd) were the contractors, the former being
sponsible for the woodwork and the latter for the
asonry.

Intercommunication.

QUESTIONS.

[10640.]—**Sea Sand in Mortar.**—There seems to be a general idea that when sea sand is used in mortar (or plaster) it has a tendency to keep the walls damp, and even draw water. Is this so? and are there any other bad effects to be traced to its use?—WAVE.

[10641.]—**Floors.**—At p. 482 of the "B. N.," article "Prices," subject, "Joiners' Floors," the floors are all described as "laid folding," except those mentioned "laid diagonally." Even the floors, "grooved and tongued," "rebated," and "loose tongue," of pitchpine and wainscot oak, are described as laid folding. As only the very commonest broken joint floors are laid folding, surely some mistake has been made.—G. C. B.

[10642.]—**Strong Room.**—I shall be glad if some kind reader will give me particulars concerning the best means of ventilating and lighting strong rooms. Also names of makers of fireproof doors and ventilating gates, and best mode of fixing same? Similar questions to above were asked in your issue of September 2nd, 1887; but I can find only one reply, which gives very little information. Perhaps "Clerk of Works," who replied on that occasion, will kindly reply again, giving a few more details?—F.

[10643.]—**Roman Mortar.**—Which of our limes in present common use, if either, resembles those used by the Romans in England? Is it true, as I have heard, that the Romans slaked down their lime and sand, and kept it in pits for a very long time, over a year or more, before beating it up and using it as mortar? Would the same system applied to our poor limes of the type of Dorking and Halling lime result in a better mortar than would the present system of slaking it on a bed of sand and covering it up for 24 hours, and then using it within eight or ten days?—W.

[10644.]—**Joists.**—On looking at the grain of the end

FIG. 1.

FIG 2.

FIG. 3.

of a joist, which out of the three sketches would be considered to be the best for strength and durability, and why?—SAP.

[10645.]—**Building Materials.**—Can some reader kindly recommend me a good book on building materials, more particularly on stone and timber? Rivington's is too expensive. Also some book treating of the manufacture, trade names, qualities, &c., of iron and steel, and suitable for the requirements of students entering for the Honours Building Construction Exam. (Science and Art Department, South Kensington)?—ENQUIRER.

REPLIES.

[10632.]—**Lift and Force Pump.**—"Seleiba" does not give the depth of well, nor height of tank; but, ordinarily the internal diameters of the suction pipe and rising main should be half of that of the working barrel.—G. C. B.

[10634.]—**Brick as a Building Material.**—In a stone-built wall there are less joints than in a brick wall of the same area; consequently, there is less likelihood of the admission of cold and damp through defective joints in stonework than in brickwork. Some building stones induce dampness by possessing the power of attracting and condensing on their surfaces atmospheric moisture I have seen an instance of this in which the walls of a mansion had to be cased with studding to receive the plastering. The insanitary condition of brickwork is caused by the omission of a damp-proof course, bad material, and bad workmanship. Build your house with thoroughly hard, well-burnt bricks of the Coal-measures (of which there are an abundance about Huddersfield), grouting in each course with semi-liquid mortar, and you will have nothing to fear. The walls should not be less than a brick and a half, and the outside joints should be struck—course by course—during erection.—BRICKWORK.

At the meeting of the Quarterly Court of the Worshipful Company of Plumbers, held at the Guildhall, London, on Friday, Mr. W. H. Bishop, re-elected Master, Mr. Charles Hudson, re-elected Warden, and Sir Philip Magnus, elected Renter Warden, were severally sworn in to their respective offices for the ensuing year.

On Tuesday week the new church of St. Mark, Claughton, was dedicated. The church consists of a nave with north and south aisles, morning chapel on south, and a parish room and vestries on the north side. The north aisle terminates in an octagonal baptistery, and a detached tower and spire (the latter rising to a height of 170ft.) is eventually to be erected at the south aisle. The style is Late Pointed, and the external walls are built with white Storeton, relieved by dressings of red Runcorn stone. The church, which will seat 700 persons, has been erected by Mr. W. H. Forde, Claughton-road, and was carried out under the superintendence of the architect, Mr. C. W. Harvey, in conjunction with Messrs. Pennington and Bridger, of Lord-street, Liverpool. Mr. John Todd officiated as clerk of the works. The cost is £8,000.

Legal.

TENANCY AGREEMENTS.

WHAT are called "Tenancy Agreements," but are really leases for one or three years, or from year to year, are very commonly drawn up nowadays. Printed forms are frequently used, and parties often sign these agreements without clearly understanding their effect. Sometimes a tenant taking a house for a year certain, signs a document that appears to carry out his intention, and states that the premises are let to him from a date named "for one year certain"; but, upon reading a little further, it will be found to say "and so on from year to year." Now, those words create a yearly tenancy beginning directly after the first year certain expires. The effect is, of course, to fix the tenant for at least two years—i.e., the one year certain to start with, and then the yearly tenacy, which means another year certain, because it cannot be determined except by giving six months' notice to quit, expiring at the same quarter as that from which it began. This way of drafting agreements from one year is very common, and it is a trick by which many people have been deceived. Another point is that something of the same sort is often done in agreements for three years, by providing that after the expiration of the three years, the tenant shall become a tenant from year to year, unless he has given the landlord three months' notice of his intention to quit on the expiry of the term of three years. This looks fair enough, but tenants often overlook the clause, or they still more often forget to give the three months' notice, and then find themselves, to their surprise, fixed for at least one year more as a yearly tenant, subject, moreover, in all respects, to the same provisions of the agreement as during the three years that have expired. Then, again, it is frequently forgotten that an agreement for more than three years from its date must be under seal to be valid as a lease. Another point in these agreements is the stamp. If a document is called an agreement, popular knowledge thinks it only requires a sixpenny stamp; but of course tenancy agreements, though but for one year, are leases in law, and must be stamped as such, *ad valorem*, upon the rent payable, according to the scale of duties. FRED WETHERFIELD, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by Tuesday morning each week.

CONSTANT READER.—ROAD—TITHE.—Where land is taken for public purposes, the tithe-rent charge should be, and usually is, redeemed. Probably that has been done in the present case. At all events, the local authorities would not take over a road liable to any charges of this kind.

SUBSCRIBER.—DRAWINGS.—LOSS.—LIABILITY.—If the drawings were sent by post, they can be returned in the same way, and the person so returning them would not be liable for damage for their loss if he proved posting them properly addressed. In the absence of a request to register and payment of the fee, I do not think there would be any legal obligation to do so on the party returning them.

ARCHITECT.—INCOME-TAX.—DEDUCTION.—There are no special rules affecting architects in making their returns for Income-tax, and they would come under the same regulations as other professional men. They must pay according to the profits made. As to the other two questions, I shall be pleased to consider them, if you will put more precisely the points you wish me to deal with.

The extensive premises of Guilbrand, Gregersen, and Sons, of Pesth, timber merchants and parquetry manufacturers, were burnt out on Sunday, the total damage being estimated at over £50,000 sterling.

The Manchester, Sheffield, and Lincolnshire Railway Company have decided to make at Grimsby a new dry dock, and to construct new coal jetties for the steam trawling packets. The cost of the dry dock will be about £200,000, and the coal jetties £50,000.

The fragments of a fine marble statue of the best period of Greek art have been found in the Tiber Embankment excavations below Rome. The head is of extraordinary beauty and well preserved. So far as the fragments have been put together, the sculptor Monteverde and the painter Morelli pronounce the statue to be a *chef d'œuvre* of Greek art. It will shortly be exhibited to the public in the new Museum in the Baths of Diocletian, where other important objects lately found in the Embankment works are preserved.

LEGAL INTELLIGENCE.

Damages against a Wakefield Builder.—At the Wakefield County Court on Wednesday week, his Honour Judge Greenhow was engaged for several hours in hearing a case of interest to builders and their workmen. The plaintiff was Henry Dickinson, a bricklayer, living in Gosnay-terrace, Eastmoor, and he sued Mr. John Bagnall, builder and contractor, Eastmoor, for £70 damages under the Employers' Liability Act. On the 8th of June the plaintiff was working in defendant's employment repairing a maltkiln in Thornes-lane. Plaintiff fell from a scaffold, in consequence, as alleged, of one of the scaffold poles being defective, and defective to the knowledge of the defendant and his son William, a foreman of the defendant's. In defence it was said that the plaintiff selected the scaffolding poles, and that William Bagnall was only the time-keeper. His Honour gave the plaintiff a verdict for £80 and costs, £40 for wages, and £40 for pain and injury, he having fallen from the scaffolding which gave way and sustained serious injury.

Re George Mower and Son.—The first meeting was held on Sept. 30 before Mr. Hough, Official Receiver. The debtors are builders and contractors, carrying on business in Wells-street, Hackney. Their statement of affairs shows total liabilities £4,291 10s. 10d., of which £3,462 15s. 10d. are unsecured, and assets £1,360 19s. 2d. A proposal for a composition of 7s. 6d. in the pound was submitted, payable by three instalments within six months from the date of the approval of the scheme by the Court; and after discussion, the meeting was adjourned in order that the debtors might obtain a guarantee for the composition.

Peto Brothers v. Apperley.—The initial stage of this important case, brought by a well-known firm of builders against the secretary of the Amalgamated Committee of Carpenters and Joiners, to restrain him from causing bills to be posted outside the Cane Hill Asylum, Coulsdon, calling upon carpenters and joiners to keep away from the works, was disposed of by Mr. Justice Jeune on Friday. His lordship, without calling upon counsel for the defendant, refused the application for an injunction. Without expressing any final opinion on the case, he was quite unable to say, in the absence of any precedent for such an action as this, that there was any such cause of action as would justify him in interfering at the present moment. He had great doubts whether it would make any material difference to Messrs. Peto if between now and the trial of the action the publication of the particular bills was restrained, and he did not think that if such publication was not restrained the defendant's Association would be any nearer to its object. He therefore refused to continue the injunction. Defendant's counsel asked for costs; but Mr. Justice Jeune reserved them to be dealt with at the trial of the action.

CHIPS.

The south side of the parish church of Blewbery has been restored as a memorial to the late vicar. The work has been carried out under the direction of the diocesan architect (Mr. John Oldrid Scott), by Mr. Y. J. Lovell, of Marlow.

A new post office has just been built near Bantry at a cost of £800. The contract for masonry was carried out by Mr. William Murphy, of Bantry, and that for carpentry by Mr. Daniel Donovan, of the same town.

The commission for the statue of Garibaldi, unveiled at Nice on Sunday, was originally given to the late M. Etex, and after that sculptor's death was carried out by M. Deloye. The figure is of marble.

The ornithological picture, entitled "A Select Committee," painted by Stacey Marks, R.A., and the bronze statue of "Peace," by Onslow Ford, A.R.A., have been selected for purchase, for the permanent collection, by the Arts Committee, out of the current Autumn Exhibition in the Walker Art Gallery. Both works were prominent features of the recent Academy Exhibition.

Alterations have been made to the Union workhouse, Kensington, embracing the ventilation, the extraction of the vitiated air now being effected by the latest improved form of Messrs. Robert Boyle and Son's patent self-acting air-pump ventilator.

The local board of South Stockton elected on Tuesday Mr. M. Scott, assistant surveyor of West Hartlepool, as town surveyor, in succession to Mr. W. J. Alderson, resigned.

Through their clerk, Mr. H. De La Hooke, the London County Council give notice that, under the provisions of the London Sky Signs Act, they will demolish any sky sign, the "owner" of which has not obtained from the district surveyor a certificate to the effect that it may remain for a period of two years without being likely to cause danger. The latest day for giving notice was Tuesday last.

Our Office Table.

The value of the motto system in competitions in securing a fair field for all comers is curiously illustrated by the result of the Baths competition at Coventry, where it transpires that the assessor recommended a committee to adopt for execution, at an estimated cost of £14,000, a design sent in under motto by an architect's pupil who is still technically an "infant." When the minutes of the Baths Committee came up for confirmation by the City Council of Coventry, the question was raised who was the Mr. Burgess who was to be instructed to prepare the detailed specifications, and what was his age? The explanation given by the committee revealed the fact that Mr. Burgess is a pupil to Messrs. Spalding and Cross. Seeing this competition announced, he inquired if his principals were going in for it. They replied in the negative, when the enterprising youth obtained leave to try his hand, and was allowed the run of the office in the preparation of plans. The assessor and the committee unanimously selected his design as the best, and Messrs. Spalding and Cross handsomely promised, if the committee's recommendations were adopted, to see it properly carried into execution. Several members demurred that it would be imprudent for the corporation to enter into an engagement with a minor, but by a large majority the members supported the committee, and Mr. Burgess was appointed architect at the usual 5 per cent. commission.

The London County Council, at their meeting on Tuesday, rejected three out of five proposals of the Improvement Committee. They included the removal of Bozier's-court, Tottenham-court-road, and of the "island" buildings between Holywell-street and the Strand, and the construction of a new street from Tooley-street to Bermondsey New-road as a southern approach to the Tower Bridge. In the two former cases the Committee recommended that power should be taken to levy a "betterment" rate on the owners whose property would be benefited by these alterations; and this was the point to which the majority of the members of the Council objected. The scheme for the improvement of the northern approach to the Tower Bridge has already been passed. The report of the water-supply committee, of which the main features were given by us last week, was brought up, but the discussion was adjourned.

The Pre-Raphaelite School of Painting was the subject of an interesting address delivered by Mr. William Morris at the Birmingham Art Gallery on Friday night. He pointed out that the pre-Raphaelites had impressed their art upon the present generation of English people, and, to a certain extent, upon the artists of France. The school itself had made its mark on the age. The renowned year of 1848 witnessed the first appearance of the Pre-Raphaelites before the public. Their social and particular doctrine was naturalism, as opposed to the tradition that then dominated the artistic schools of Europe. The Pre-Raphaelites broke with the old and worn-out tradition which had tyrannised over art so long. Most people would have thought the public would have received this attempt with acclamation; but, on the contrary, the paintings were characterised as monstrous, and the artists were received with jeers. John Ruskin, however, became their champion, and eventually they made their way, and achieved success as a school. In addition to the mere presentment of natural facts, the school aimed at a far more important kind of painting—the conscientious presentment of incident. They came to the conclusion that, besides excellent execution, care, and skill bestowed on the painting, it should tell some kind of story.

Alderman Thomas Hill, J.P., a well-known builder at Bradford, died on Friday after a lingering illness. Mr. Hill belonged to one of the old Bradford families, his father being a builder and contractor, to which business the deceased also devoted himself for many years. He entered the Bradford Town Council in 1866 as councillor, and in 1872 he was raised to the aldermanic bench, on which he held a seat until his death. In 1885-6 Alderman Hill was elected Mayor, and served the town in that capacity with dignity and success. A year later he was placed on the commission of the peace for the borough. He carried out the work of restoration of the parish church of Bradford, and presented the pulpit now in use, after constru out of the oak of the old disused pews deceased was in his 67th year, and was unm

The death is announced of Signor V Vela, the distinguished Italian sculpto expired at his native village of Lignoretto, Canton of Ticino, in his 70th year. At of twelve he was employed in a stone quar soon manifested a great aptitude for scu Through the aid of friends he was sent to in 1836, where he was employed in the wo the restoration of the cathedral. He was of the sculptor Cacciatori, and in 1848 part in the sculpture competition at Veni carried off the prize, his subject being relief, "Christ restoring the Daughter of Ja While at Rome modelling his "Spart Vela was recalled to the Ticino, to take the war of the Suderbund. On the conc of the campaign he returned to his studi executed his statue of "Spartacus," a which attracted great attention at the Exhibition of 1855. Signor Vela proce Turin, where he executed several statue cluding those of "Hope" and "Resigna At Bergamos he finished his "Harmo Tears" for the monument to Donizetti. Paris Salon of 1863 he exhibited a gr marble, "France and Italy," which wa sented by the ladies of Milan to the E Eugénie. Many of his other works we exhibited in Paris, where he obtained medal in 1867.

The twelfth examination held und auspices of the Incorporated Associati Municipal and County Engineers was held Town-hall, Manchester, on Friday and day, the 2nd and 3rd of October. The and graphic examination was taken on t day, and the *viva voce* occupied the great of Saturday. The examiners were E. Prit M.Inst.C.E., Past President; Jas. M.Inst.C.E., Past President; A. M. M.Inst.C.E., and C. Jones, A.M.I.C.E. President. The next examination is to b in London in April, 1892.

The American insurance companies issue policies on cattle have been led to t clusion that a distinct increase in the caused by the use of wire fences on farms. number of cattle reported as killed by lig is very large. "Most of the animals," writer in the State of New York, "we wire fences at the time, and it is suppos metal strands act as a conductor of electri a degree sufficient largely to increase the

The foundation stone of a new mission was laid at Plymouth, on Michaelmas Day building will be red brick, with Portland dressings, and will accommodate 200 persons J. D. Bellamy is the architect, and Messrs. Lethbridge and Son are the contractors.

Mr. A. T. Walmesley, engineer to the Harbour Board, together with Mr. Webst Mr. Thorne, architect and contractor respe for the Dover Promenade Pier, and other men, fixed the position on Saturday for th mencement of the work of building the pier, will be carried out 1,000ft. from the centre bay. A pavilion will be erected at the end pier.

An Alpine Club hut is being built on the Peak of Monte Rosa. The hut will be the building in the world, being at an altitude of 15,000ft.

The city council of Newcastle-on-Tyne Wednesday in the council-chamber at the hall, which has been refurnished and reseate outlay of about £1,000. The work has been out under the direction of Mr. W. G. Law engineer.

A church is about to be built for the village of Cudworth, near Barnsley. It wi plain structure, consisting of nave, an aisl chancel, and will seat 250 persons. The est cost is £2,000.

The parish church of St. Anne, Limehou reopened on Wednesday by the Bishop of L The choir has been brought down from th gallery into stalls in a conventional chancel sanctuary walls and ceiling have been gilde illuminated, and new windows have been on both sides to admit more light. The chu also been cleaned and decorated.

The parish church of Falkirk has been r under the direction of Messrs. T. H. and F. of Bradford.

ER SUPPLY AND SANITARY MATTERS.

POOL.—A meeting of the Liverpool Water y Works) Committee was held on Tuesday. ago the committee commissioned Sir Ben- Baker to investigate that part of the r scheme of the Liverpool Corporation relates to the pipe-line crossing of the at Fidler's Ferry, and this report was read day. It dealt with the point as to the t of the works at Fidler's Ferry being suc- y accomplished within a reasonable space of nd replied to the question as to whether this the existing scheme should be persevered rhether some alternative scheme should be d. Sir Benjamin reported as to his examina- the works, and as to his consultation with eacon. Upon certain modifications, upon they were agreed, being carried into effect, of opinion that the scheme can be accom- within reasonable time. The suicide of Mr. ochrane, the contractor for the tunnel, gave an animated discussion at the committee g, and the opinion was freely expressed that ifortunate feature in the Vyrnwy under- had proved such a terrible source of worry xiety as to be a factor in his death. Sir B. s report was, on the recommendation of the ttee, adopted by the Liverpool City Council dnesday.

ISTONE WATERWORKS.—The Penistone Local , Yorkshire, have arranged to supply a large ity of water to several adjoining districts, and it e necessary to put down additional duplicate ing machinery, and otherwise alter and extend works to provide the additional supply, and nt the possibility of a breakdown. The Local have called in Mr. W. H. Radford, C.E., of gham, to report on the present works, and them as to the proposed works.

DRUTH WATER SUPPLY.—The Redruth Local , at their meeting held on the 28th ult., nted Mr. H. Bertram Nichols, C.E., of Bir- am, to prepare a scheme, and to report, with ate of the probable cost, for the water supply druth, and he has been requested to make gements for visiting the locality and meeting ard on as early a date as possible.

YL AND DISTRICT WATER SUPPLY.—At a ng of the delegates of the joint authorities of St. Asaph, and Abergele, at Rhyl, on day, a report by Mr. George F. Deacon, C.E., e water supply to Rhyl and district was read. considerable discussion it was unanimously ed to recommend to the local authorities of Abergele, and St. Asaph, that steps be at aken with the view of Promoting a Bill in ament for the compulsory acquisition of the and district water undertaking for the supply ater for domestic, general, and sanitary oses within the districts of the said authorities.

---

e Lady Mayoress, on Saturday, laid the me- l stone of the new church of St. Peter's, lewood, which is to take the place of an iron ing. The new church will be of brick, and l accommodation for 750 worshippers. The cost will be about £6,000. Mr. T. H. Watson architect.

e session for the delivery of the Oxford ersity Extension Lectures opened on Wednes- n last week, September 30th, at the Melcombe School, where the Rev. G. Herbert West, , of Christ Church, Oxford, and Bournemouth, I.B.A., A.M.I.C.E., delivered the second part is course of lectures on the "History and ciples of Architecture."

e parish church of Peterstone, midway between iff and Newport, was reopened on Friday after ration at a cost of £1,800 for the nave, and for the chancel. The nave arcades have been ilt, and a new roof placed over it, while the r has been restored. Messrs. Habershon and ckner, of Newport, were the architects.

n Saturday a mass of bastard rock, which has fered with the development of the workings at l Penrhyn's Carnarvonshire slate quarries, was olished by the agency of some eight tons of ing powder, the weight of rock shattered oximating 80,000 tons. The powder was placed rmetically-sealed chambers, and the explosion successfully carried out by Mr. Young, the ager of the quarries, and Mr. Pritchard, the king manager.

he London School Board have accepted the der of Messrs. Higgs and Hill, South Lambeth- l, amounting to nearly £50,000, for the enlarge- t of the offices on the Embankment; the same are the contractors for the foundations now g put in. The Board have adopted plans of srs. Spalding and Cross, of Queen-street, sub- ed in competition, for a swimming-bath to mmodate 50 boys, to be added to Pocock-street ol, Blackfriars, S.E.

Trade News.

WAGES MOVEMENTS.

BOLTON.—The Bolton plumbers commenced on Monday with their advance of wages from 8d. to 8½d. per hour. The hours remain at 52 in summer and 47 in winter; but the men are to be allowed 3s. per week lodging money when working in the country. On the other hand, the men concede an extra apprentice to each master, each apprentice to be bound before he is 15.

THE CARPENTERS' STRIKE IN LONDON.—The latest development of this movement is that yesterday (Thursday) the plasterers' labourers engaged on the Imperial Institute, for which Messrs. Mowlem are the contractors, dropped work, refusing to work with "blackleg" carpenters. The plasterers followed suit, and the masons' labourers being also struck, the works were temporarily, at least, brought to a standstill. Both the Master Builders' Association and the United Trades Committee still show a determined front: the former assert that they never received, and thus have never refused, a distinct request for arbitration, but add that they adhere to the terms offered in July—9d. per hour for 52 hours in the forty weeks of summer, and 47 hours for the remaining twelve weeks. On the part of the men, it is reported that two more firms—Messrs. Canning and Mullens, of the Elephant and Castle, and Mr. Marks, of Bell-street—have conceded their terms. Besides the levies from branch societies in the trade, a large number of outside contributions have flowed into the coffers of the United Trades Committee during the present week, including £225 from the Provincial Bricklayers' Society, £50 from the Printing Machine Managers, £50 from the Railway Servants' Society, a first instalment of £25 of £100 voted by the Midland Miners' Federation, £20 from the National Flint Glass Workers, £15 from the London Society of Lithographic Printers, £12 from the Second Branch of the Amalgamated Society in New York, £10 from the National Labour Union, and smaller amounts from the Operative Masons, the Saddlers and Harness Makers, the Edinburgh Trades Council, the Amalgamated Bakers, the Spring-Knife Grinders and the Table-Knife Grinders (both of Sheffield), and the Bourse des Travaux, Paris.

EDINBURGH PAINTERS AND TECHNICAL EDUCATION.—A well-attended meeting of the Edinburgh branch of the Painters' Federation was held in the Labour Hall on Friday night, Mr. Reddeck, president, in the chair. At the recent quarterly meeting a technical school for apprentice painters was proposed, but consideration of the matter was adjourned until Friday night, when the scheme and rules in connection with it were approved. It was resolved to submit these to the Masters' Association for approval.

GLASGOW.—The paviors in the employment of Messrs. A. and J. Faill, Glasgow, have struck work for an advance of ½d. per hour, which would increase the rate of wages to 6½d. per hour.

On Saturday the memorial stone of the new Free Church of Glenboig was laid. The building is being erected from plans by Mr. George Arthur, architect, Airdrie, and will accommodate 384 persons. The cost will be about £1,300.

The Library Association of the United Kingdom recently decided to form a collection of library appliances, plans, and bibliographical works, for permanent exhibition in London, and towards that end are now soliciting contributions of specimens of everything connected with books and libraries. All specimens or letters on the subject should be addressed to Mr. James D. Brown, Public Library, Clerkenwell, E.C.

The foundation-stone of a new chancel in All Saints' Church, Carshalton, was laid on Saturday afternoon by the Duchess of Albany. The church at present accommodates 500 persons; but by the proposed enlargement the seating capacity will be doubled. The estimated cost is £10,000. The architect is Sir Arthur Blomfield, A.R.A.

The new council-chamber for the town council of Tunbridge Wells was formally opened on Wednesday week. It has been erected and fitted up from the designs of Mr. William Brentnall, the borough surveyor.

At a meeting of the Oswestry town council, held on Monday, it was decided that the plans for the new municipal building should be intrusted to the borough surveyor to carry them out, under the superintendence of Mr. Thomas M. Lockwood, of Chester.

The restoration of the parish church of Standlake, near Witney, which has been in progress since 1881, at a total cost of £6,000, has just been completed. Mr. Clapton C. Rolfe was the architect, and Messrs. Harry Hems and Sons, of Exeter, have executed all the carvings.

MEETINGS FOR THE ENSUING WEEK.

FRIDAY.—Architectural Association. Address by the President, F. T. Baggallay. 7.30 p.m.

CHIPS.

The foundation-stones of a new church at Round's-green, Langley, near Birmingham, were laid on Monday. The building will accommodate 300 persons, will consist of new chancel, organ-chamber, and vestry, and will cost about £1,600. Messrs. Wood and Kendrick, of West Bromwich, are the architects, and Mr. Willcock, of Wolverhampton, is the builder.

Superintendent Abbott, after an inspection with President Vanhorne of the bridges and superstructures of the Pacific Division of the Canadian Pacific Railway, says that it has been decided to replace the wooden structures by others of steel, iron, or stone. It is estimated that the cost will be two million dollars, but the shortening of the running time between Vancouver and Montreal will repay the cost of the outlay.

After complete renovation of the interior and exterior, with the addition of a chancel, the church of St. Paul's, at East Boldre, or, as it is commonly called, Beaulieu Rails, Hants, was reopened on Thursday in last week. The church was built in 1839. A new chancel has now been added, and the brick floor has been removed to give way to a more suitable wooden one. The sitting arrangements have all been modernised. The old plaster ceiling has been replaced by one of matchboarding. The alterations have been carried out by Mr. Wheeler, builder, of Lymington, according to the plans of Mr. Wheeler, of Southampton.

The forty-fourth session of the Liverpool Architectural Society was opened on Monday evening, when an inaugural address was given by the President, Mr. T. Harnett Harrison, F.R.I.B.A.

Holloway's Pills increase the appetite, strengthen the stomach, cleanse the liver, correct biliousness, purify the system, invigorate the nerves, and reinstate sound health. The enormous demand for these Pills astonishes everybody, and a single trial convinces the most sceptical that no medicine equals Holloway's Pills in its ability to remove all complaints incidental to the human race.

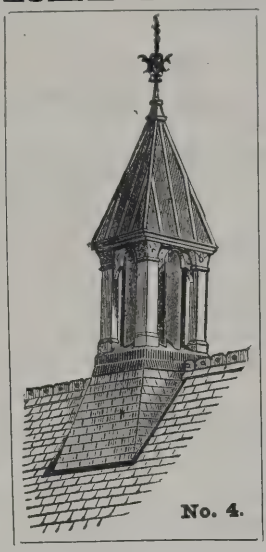
ELF-ACTING AIR-PUMP VENTILATOR.

(PERFECTED OCTOBER, 1887.)

50 PER CENT. REDUCTION IN PRICE.



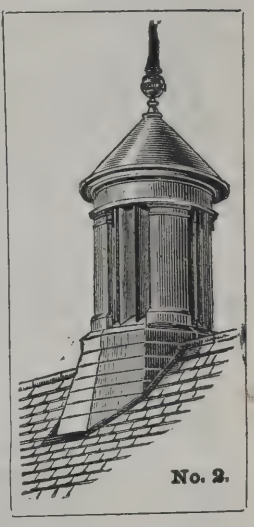
No. 1.
Registered Design.

The most Powerful Exhaust and

CHEAPEST VENTILATOR IN THE MARKET.

IMPERVIOUS TO WET AND DOWN-DRAUGHT.

Strongly made of the Best Steel, Galvanised, and Finest Workmanship.



No. 4.

CAUTION TO ARCHITECTS.

FRAUDULENT SUBSTITUTION.

Having received complaints alleging the failure in certain cases of the Air-Pump Ventilator, upon examination being made it was found in every instance that the contractor had substituted (to secure a greater profit to himself) a cheap and inferior Ventilator resembling, in outward appearance, the Air-Pump Ventilator which had been specified to be used.

It is respectfully requested that, in specifying the Ventilator, the words "ROBERT BOYLE & SON'S LATEST IMPROVED PATENT SELF-ACTING AIR-PUMP VENTILATOR" be used.

No. 2.

FRIDAY, OCTOBER 16, 1891.

ESIGN AND EXECUTION OF BUILDINGS.

GREAT many of the failures in the design and construction of buildings ng from a want of skill. It is very true a knowledge of requirements is abso-y essential to an architect before he can gn with any satisfactory assurance; he also wants to know how those irements can be met or complied with in best possible manner. An ordinary der knows the wants of a dwelling-house ty accurately, but his house may, for all , be awkward in arrangement, and ex-ively uncomfortable and distasteful also. engineer may understand better than an itect the requirements of a factory or ping station, yet the result of his know-e may be anything but a satisfactory solu-; it may be full of crudities which a ful architect could have obviated if he had instructed in the actual requirements; nat we have buildings that fulfil require-ts, but are unskilfully designed, and rs that are skilful in design, but inade-te to meet the requirements. This is, ed, the wide gulf which separates build-from architecture, and which, so long as lifications are different, must continue to rate the engineer from the architect. have abundant and unfortunate wit-es of this divorce of requirements from round us. Our great warehouses, mills, ges, engine-houses, are good or bad, just ney exhibit or otherwise skilled or un-ed arrangement. In many instances most satisfactory buildings of these ses have been the joint productions of the ineer and architect, or at least of a man has studied both requirements and itecture. We may leave out of the pre-argument the question of "art" alto-er, for a building is often "artistic" which regiously defective to meet actual wants—nean, of course, that art can be superadded he form of dress without entering into motives of the designer. As there can o skilful adaptation of buildings with-a knowledge of requirements, so there be no art worthy of the name without a terly acquaintance with those essentials. l may enter into all building, for without rt cannot exist, and it is this aptitude ch is so hard to learn. Unfortunately s do not help us much; it is more a gift iscernment than anything else. Again, ring degrees of this endowment are called Good construction is one element, but all. A well-framed roof nicely calculated stresses may be placed over a building: its its purpose well as a covering, but it not strike one as being the most wisely en form of roof. A factory for a particu-kind of machinery is well constructed, but ay be badly planned. The mechanical ection of the structure may, and often , co-exist with meagre ideas and imper-general arrangement. Again, the ils of a building may be perfect, but they , and often do, appear in structures of plan. These last two qualifications—ainly the former—are often conspicuous tructures of the engineer. They may be d the technical qualities of building. y of our hotels, blocks of residential nbers, hospitals and asylums, commercial dings, are conspicuous examples of more in the construction and details than in arrangement or general design, which is a matter of architectural skill. These technical qualities are important, though unfortunately they are often made obtrusive and destructive. They often appear unaccompanied by skilful adaptation or a real grasp of the circumstances. The reason of this is that architects neglect these technical points, and they are consequently left to experts or special tradesmen.

If the profession wish to retain in their own hands the complete design and furniture of buildings, they must arouse themselves from their present passive position. The policy of leaving the fittings and appointments of their buildings to others—non-intervention in technical matters—is scarcely one that befits the theory of "thoroughness" which now pervades all art and is the boast of the Revival. We see what that Renaissance has done to restore ecclesiastical architecture, and is now doing to make domestic art real and permeating in its effects. That end will not be reached till the dwelling-house is no longer the mere receptacle of a farrago of tastes and fancies, but its furniture and appointments are made to agree with the architectural design as far as possible, and in harmony with the decoration. But how to become master of a profession which makes such a large demand on our time and attention is the question. A combination of the qualifications we have described is no easy matter. A skilled designer is one who knows not only exactly what is wanted, but how those various requirements can be arranged to the greatest advantage. To do this he ought to know so much about these details as will enable him to vary their form and position. Nothing is more evident than that if we want to become masters of any subject, or a particular class of building like a hospital or a school, we must be able to alter and modify the fittings to suit our purpose without losing sight of the actual requirements of such fittings. Some men know so little about the points of importance to be kept in view that they are too timid to alter, too diffident to use their own judgment, for fear of spoiling the effect, or making a mistake. Bold alterations and vigorous methods can only be attempted by a master, in the same manner as a great painter can set aside the ordinary conventions of his art, and discard or neglect those technical points which lesser painters are constrained to follow, and just as a proficient musician can now and again ignore with impunity the niceties of the rules of composition—can introduce unexpected progressions, or even suffer consecutive fifths to pass unheeded. In short, the weak and incompetent artist is a slave to technical methods—they have become his master. We see this especially in the various trades connected with building; how little the artistic function has united or controlled them; how often the bricklayer's work or mason's labour is in conflict with those who follow; how the joiner and plasterer work in total disregard of the architectural scheme; how especially the fitter, the carver, the glass and metal worker, and the decorative artist is each doing his best to call attention to his own trade, to obtrude it at the expense of others, unmindful of the value and power of a united aim.

The architect is the only individual who can rally these trades, and bring them to a proper sense of united action. He must in the first place master them. He must be prepared to learn a good deal in the workshop and studio, to visit quarries, manufactories, to find out the practical difficulties of workmanship, the modes and procesess by which materials can be converted and treated. By this preparation he will be better able to prepare detail drawings and specifications. These are the instruments by which the skill of the architect is conveyed to the workmen, and it is regrettable how little they are regarded in this sense. Too strong a line is drawn between design and execution. When his preliminary drawings are approved, the architect thinks his labour is completed. Instead of only being the beginning, they are looked on as the ultimatum, and what remains to be done is the builder's work. This unfortunate estimate of the architect's function has created an undesirable chasm between the architect and builder. To bridge over this chasm should be the object of every one who desires that art thoroughness should be found not only on the paper design but in the actual building. The specification and detail drawings are the only instruments by and through which the designer can convey his meaning. But there are two impediments. The first is the want of practical training on the architect's part; the second, the want of art training on the part of the workmen. The designer is not a master of the trades; the crafts cannot interpret. The first fault is one that costs the profession a great deal; they have to retire, or play "second fiddle" whenever the art craftsman or the engineer appears on the scene. To the sensitive mind it must be remorseful to see a fine interior of a church or a public hall destroyed by fittings and incongruous design, or some atrocious scheme of decoration; a well-designed dining-room spoilt by a wall hanging, a chimney-piece, or brass chandeliers or electroliers of unsuitable character. Much havoc has been done to new buildings by the often execrable taste of warming and ventilating engineers, in fixing coil cases or stoves, or ventilators of a character completely at variance with the style of the building; we have seen also costly residences ruined by the taste of horticultural builders. Surely these things ought to have formed part of the architect's design, or have been reserved by him in the specification. The fact is, he does not know enough about them to undertake the responsibility; he does not like to interfere with the design of a fitting of which or its manufacture he knows very little. If he knew the technical points he might suggest something that, although not according to trade rules, would be, nevertheless, a great improvement. Thus it is that imperfect technical or practical knowledge cripples the architectural design, and permits some flagrant violation of taste or a clumsy mode of execution.

In the second place, the principles and methods of art are unknown to the majority of workmen, who entertain the same exclusive view as regards their function as the architect does. No doubt the contract system has encouraged this view, as every contractor is inclined to place his interpretation on the design. Drawings supplied by the architect pass through several hands, the contractor, his foreman, the operative; each exercises his own judgment; details are altered or amended to meet the "quantities." Discrepancies between the design and detail, or specification and detail, are discovered, and a very different interpretation is given to the drawing from that intended by the architect. For one detail, as a moulding, another is substituted. Some workmen are poor hands at reading and drawing; perhaps they do not see clearly what is intended. At other times they take upon themselves to make alterations which are completely the opposite of what was intended. We cannot expect these impediments to be removed till the profession and the trades begin to understand one another, which will only take place when the present obstacles between the architect and the workman cease to exist. Accurate knowledge of the trades, carefully prepared specifications and details, and artistic training on the part of the operative, are three of the points that call for immediate attention. The class of architectural drawing and the night classes for building construction that have been established in University College by the aid of

the Carpenters' Company, are facilities towards the attainment of accurate working drawings, and the many technical school classes in London and all our large towns afford equal facilities for the operative.

NEW MATERIALS AND THEIR SUGGESTIONS.

WITH what success the older materials of architure may be superseded by newer forms and methods is a question which we are hardly yet in a position to answer. Of course, we cannot expect much by remaining idle or passive, or contenting ourselves by seeing what other nations are doing in utilising new materials and methods of construction, and in so far we agree with Prof. Roger Smith in his opening lecture at University College, that if we are to "work out the evolution of a new English architecture," having for its starting point new and improved methods of construction, and new and improved materials, we must not stand on one side, but accompany the "new departure." There is little doubt that in America we are witnessing many bold experiments with materials like iron in cast and sheet form, which shock the more sensitive artistic minds of our own countrymen. Few of our English architects would like, for instance, to use metal roofing-tiles, iron architectural dressings for external purposes, or metal ceilings; yet in spite of the repugnance one feels for metal in such situations, the use of iron in various forms still continues in the States. Other materials have made their appearance, such as slabs and other constructive forms of slag wool, largely used in floor and partition construction, roofing, and other purposes. Many fresh substances manufactured out of waste products have been introduced, and we can hardly turn over any pages of the advertisements of our building contemporaries in America without coming across new substitutes for building materials. We may continue to be perturbed by these introductions and innovations, but, despite all our prejudices, they are likely to be further pushed. Architects were shocked when iron first came into general use as a building material. The same outcry was heard against concrete as a substitute for brick and stone, and terracotta was not very kindly received at its general appearance, or rather reappearance, some years ago. But since then these materials have entered very largely into our buildings, and with good results. Both the last-named materials are only revivals. Terracotta was well known in Northern Italy, Germany, and the Low Countries centuries ago, and under the hands of Mr. Alfred Waterhouse, Col. Edis, Mr. Collcutt, Mr. Norman Shaw, and others, it has been made to contest the claims of brick and stone. Certainly we could hardly have expected the results it has attained. It is needless to refer here to the improvements in manufacture of terracotta blocks introduced by Messrs. Doulton, and recently noticed in these pages. As for concrete construction, the modern applications have, perhaps, exceeded all that the Romans ever did or contemplated. It would, perhaps, be difficult to define in what particular manner concrete and iron or terracotta have developed themselves architecturally. They have certainly made it possible to build with wider openings, and to increase the voids at the expense of the solids. In other words, concrete and iron have developed a style of architecture which has reduced to a minimum the solid wall, and has thereby promoted a kind of trabeate construction of great advantage to commercial buildings. An iron core surrounded by concrete, brickwork, or terracotta can be made to carry a load which would require a much larger area of brickwork or masonry to accomplish. Then these materials have enabled us to cover areas by floors of great strength and rigidity, to construct vaults and domes of great lightness and strength. The result has been a great economy of material, the reduction of points of support, the tendency of which is to produce a style of architecture of greater lightness and rigidity. A "new departure" has certainly been made in this direction, if architects will only avail themselves of the opportunity. Again, there is no doubt that terracotta has operated in the same direction; it offers considerable facilities for piers and arches, and constructive masonry expedients, and therefore is particularly well adapted for an open and light fenestral style like that of the Renaissance. It certainly favours this sort of architectural expression more than it does the solid astylar Florentine type of construction. The modern architect will do wisely to keep these distinct directions of evolution in mind, and not affect to shut his eyes to them. By using these new materials merely as substitutes for stone and brick, he will be checking, intentionally or not, the natural development of the materials, and be merely embarrassing the older styles. We regret to see so much indiscriminate use of these materials, so much inability to discover or pursue any new departure that may present itself; for it is this awakening to a sense of the value and distinguishing qualities of a new material that we may hope to retain our prestige of being equal to the requirements of the age, and worthy of the *rôle* of 19th-century architects. A daring boldness is to be reprehended as much as an ignorant innovation or a contempt of precedent. These mistakes have surely led to the misgivings of architects in dealing with new materials, to the hesitation of many in the profession to avail themselves of iron and concrete. Yet we cannot afford to proscribe materials which are forcing themselves upon public notice, nor to assert that architecture has already reached perfection and the utmost of its capabilities.

We should be sorry to see iron construction taking the place of timber for roofs, or concrete and terracotta superseding brickwork and masonry; but these things cannot happen unless, indeed, brick, stone, and timber become very scarce, or strikes like that of the carpenters made it compulsory for architects to employ ironwork. These are, however, mere possibilities. We have simply to keep pace with existing manufactures and public requirements. Mere change is not certainly desirable, and no advance has ever been made by discarding the old for the new. But there is one principle to be kept in view—namely, that new materials or new methods call for rules applicable to them, which may vary considerably from those which have been established for the old and traditional methods in use.

As a factor of change, material has not been the only or the most powerful one. Have we not to attribute a great deal of modern architectural progress to new problems in construction? Utilitarian buildings have multiplied to a vast extent, and buildings are put to uses, or rather designed for numerous purposes, unknown to our predecessors. Educational institutions have multiplied also; we have not only high-class and elementary schools, but technical schools, laboratories, and workshops, each requiring a distinct treatment. Have not some of these new problems called for changes in architectural style? It may be a rather complex task to trace the changes in architectural expression due to them; but it is, nevertheless, obvious that functions, altered or new, have invariably produced modifications in style.

An hotel is about to be built at Southend-on-Sea from plans by Mr. F. Chancellor, the estimated cost being £25,000.

MODERN VENTILATION.*

WITH an audience such as this, com exclusively of past masters in sci sanitation, I am relieved of the neces preluding this paper with any argument the importance of the subject. I do not however, that the opinions of many of us coincide if required to define good venti Apparently the point of perfection wo attained if we filled our houses with air pr similar, in its percentage of injurious mat the external atmosphere, varying, howev temperature to suit our ideas of comfort. may appear a simple matter, but unfortu not only have different persons different i comfort, but doctors themselves disagree what change of air in a room constitutes e ventilation. In the case of heating, we thermometer to guide us, and the humar is so constituted that it conceives the body warm, if only the thermometer indicates a fortable temperature. With ventilation different. Persons who have been in th for some time must feel comfortably those coming in from a sharp walk in the air must feel cool; draughts must not and, if the building possesses a gallery temperature there must be as comforta that in the lower portions of the house, much warmth is called "bad ventilat too much draught is "bad ventilation is too much cold. There are many diffi which arise in aërating buildings, and alt the natural laws utilised in such a task a known, unalterable, and simple, yet the a tions of them are diverse. I will briefly ir the more usual plans; to consider their a tages and disadvantages, and from th gather materials for the delineation of a which shall as far as possible obviate objections. In the first place, we must c the essentials of a good method of venti then must see how they are complied with usual systems, and how the problems o failure upon certain points may be solved. first essential of a system of ventilation it shall not produce discomfort by causing ing of cold. Air, even warm air, impin a perceptible extent upon the skin's s causes rapid evaporation, and the avoid this should be the first consideration. It evaporation which causes "a cold," a mere expansion of the air by passing heated surfaces does not prevent it. perfect system is under complete contr must be in our power to increase the intak and the rapidity of its expulsion as circum vary. A hard-and-fast rule cannot be a but we must have a system which at wi wield a giant's power or be quiescent. A must be cheap, and of such a nature as t of its application to existing buildings radical alteration; to cottages or to palac must be simple, so that inexperienced may understand it; and scientific, s accepted philosophical formulæ may success or failure to be reasoned paper. If a system complies with requisites, and yet effects a complete ch the atmosphere of the building, so th that no person is under the obliga inhaling products of previous respiration I think we may look upon it as perfect the nearer it approaches this perfection th worthy its adoption by sanitarians. B tarians I mean those upon whom we sanitary matters, yourselves, surveyors, tects, civil engineers, &c. But it is very that the great responsibility rests upo controlling new buildings, either for the or on behalf of local authorities, and I to say that they are aware, fully, I th their responsibility, severely critical of an vation in sanitary matters, but keen to ap what their judgment and experience sh practical advance. We may divide ven systems into two classes, naming each method of dealing with the mass of ai changed. One class effects a movem increasing the atmospheric pressure at on the other by attenuation, and in both c effort to regain equilibrium is the m attained. One is a method of "*propulsio* other "*extraction*"; one tends to i density, and the other to lessen it. Y

* Lecture delivered at the Free Library, Live Oct. 10, 1891, before the Association of Public Inspectors of Great Britain, by J. F. Simmance.

rve that the tendencies I name are absolutely rned by the disproportionateness of the inlet outlet areas, or by the amount of friction ng in either case. The usual mode of effect- ventilation is the extractive action of the upon the upper extremities of shafts or and although the aspirating effect can only erted under certain conditions, yet there are ny different inventions in the direction of ring these conditions that any attempt to ibe them in detail is hopeless. But all aim ne object—that the passing wind shall ice a rarefying effect at the particular point e it crosses the surface of the still air in the or cowl, thus inducing a movement in the tion of the partial vacuum. Now there rs little doubt that the open tube, with the at a given angle, produces the greatest cting effect. Most of you have read the f results given by Mr. Hellyer in his work "Sanitary Houses," and you will have that there the open tube is placed far down st. But these tests, interesting as they are, no idea of the relative value of the cowls the chief information being as to which extracted most under the then conditions irections of the wind, or which allowed the *blow down*. It is obvious that a wind ing towards the earth, at however small an (and Glaisher's balloon records prove ctly that actually vertical currents of air , would entirely prevent the open tube from an outlet, whilst ingeniously constructed would be scarcely adversely affected at all. er would the placing of a cap over the open help it much as to be entirely useful in nting "down blow": it must necessarily ict favourable winds from exercising their spiration. The little models of various which we all have in our offices afford good ples of the power of the open tube, for by ing the cowl part and blowing across the tube, the little ball of cotton will be more ly lifted than with the cowl in position. ertical cowls with closed tops and guarded own the sides prevent *down blow* entirely not say *down draught*, as no cowl in the *per se*, has ever stopped *that*); but these under the disadvantages of being exposed e wind upon one side only, and upon the rd side air rushes in to compensate for the tion on the windward side, so the un- ate ventilating shaft only gets part of ailable power. This pressure of wind upon eward side of an obstacle, or, I should say, ant of proportion between the wind pres- on the windward and leeward sides as red with the known velocity of the passing can be tested by holding a candle close t a column or similar obstacle in the full way, but upon the side of the column not d to the wind. If the current is steady ill see the flame set in *towards* the column. ir in which the candle is held being ed is normally motionless; but the t passing it on both sides aspirates equally the stagnant spot, and causes two equal ools or eddies, to supply which air has to *towards* the column. A few experiments way, or with Dr. Lind's anemoscope, will orcibly the scientific imperfection of cowls openings on both the windward and lee- ides; or, in fact, of all cowls in which the gs are not all acted upon *instantaneously* e wind. The revolving "turtle back" a good example of an open tube exhauster; e trouble that ensues when a sudden gust d catches it full in the mouth, and the ainty which exists as to when such a ophe may happen, render its use less ed than it might be. This same difficulty pe encountered in all cases of revolving In most cases their large adoption is the e of their appearing so plausible to an ntific public, as in the case of the imedean," which was graphically described as "*screwing the foul air out of the room.*" n round by engine power it certainly screw tar up out of a tar well; but any- of less consistency would refuse to to its coaxing. This cowl extracts like by aspiration alone; the "screw" is of a nonentity, or worse. But this cowl acts ne thermometer I have mentioned. It something is going on, and the dearly love to see something moving. sses of cowls with a slanting flange round edge of an open tube, and with a plate to prevent rain entering, are amongst the best; but the wide area of the open tube, and the impossibility of preventing some winds from getting obliquely into its open mouth, are its weak points. Putting aside all questions as to the *kind* of cowl, it is certain that, with a wind moving, ventilation, and adequate ventilation, may be obtained. But it fails upon all the essential points except one. If the wind exceeds a moderate breeze, the extraction is too rapid, producing very disagreeable draughts, and is only under control by the partial—or entire—closing of inlets and outlets. And unless the wind remains constant and equal for a period unusual in this latitude, this opening and shutting might well engage the attention of a couple of men. Persons in a room ventilated by means of extracting cowls alone are at the mercy of every variation of the wind—a condition of things quite unworthy of our times. But nearly every building is so ventilated nowadays, and it may appear difficult to reconcile my opinions with the fact that many of the most eminent architects of the day are satisfied with ventilation by cowls alone. Ingenious methods have been devised for nullifying the serious objections I mention, the most intelligent being the adjustment of an intricate labyrinth of cords, weights, pulleys, dampers, &c., by which the whole ventilation scheme may be amended, and the entire aperture closed. Persons destitute of invention arrive at the same end by stuffing dusters and newspapers into the ventilator; but still the fact remains that there is a ventilator on the roof, and (again calling to mind that thermometer which, fixed at 70°, saved 50 per cent. of fuel) that is considered by the plastic human mind as sufficient evidence of ventilation. But the uncertainty of the method of extracting by cowls alone is too apparent for discussion. It is difficult to believe that architects can place reliance in ventilating engineers who prepare hard and fast formulæ on the subject, and who say "A cowl of my make, of such a diameter, to every so many feet of cubical area will extract so much air per hour," without taking into consideration the wind, which has to provide engine power for the whole business, and which is absolutely master of the situation. The only one of the essential conditions with which the cowl system complies is its cheapness, and it is as cheap as it is inefficient. The system for future use is not one dependent upon the whims of the wind, and we must look for a force more reliable and controllable. Such forces are not very numerous. We may use water, steam, or gas, either as spray injectors, or as motive power for fan-driving. Gravity may be used for the same by means of weights and pulleys, but I do not think it is often adopted, nor clockwork (spring motion), nor electricity. Now all these are controllable, and may be made to increase or decrease the ventilation at will, and to propel air into a room or to extract. A water jet is simple, cheap, and easy to work: its disadvantage is that the air becomes saturated. This is all right in summer, but in winter the air must be passed over some absorbent material, and then again the jet is affected by frost. As a power for fan-driving it is good, but only has one rate of economical speed according to size of engine and fan. Somehow, water motors are not yet very popular, and it is only amongst organs and barbers that they make notable headway. This is possibly the fault of the water authorities, who do not encourage motors; and it may also be on account of the uncertainty of water supply, unless a storage is arranged, and the difficulty then is to get head enough. For spells of work of a few hours' duration the gas-engine is infinitely preferable for fan-driving, whilst for large work a steam engine is as yet unapproached. In all these methods the question of position, whether to extract or propel, is optional. At the Liverpool Town Hall the fan extracts, and at the Mersey Railway, Hamilton-square, the 30ft. fans extract; at the Glasgow Infirmary propulsion is the method. A paper upon this latter installation was read at the meeting of the British Association, and many arguments were brought forward to prove the advantages of the method. As these will apply to all similar cases of propulsive ventilation, I will mention the more important points:—The propulsion of fresh air into the building at the floor line, and not the extraction of foul air by way of the roof; the filtration of incoming air by passing through damp material; the absolute prevention of back-draughts or down-currents. There is no doubt that some of these items are real advantages, but these are not peculiar to the system under consideration. It is difficult at first glance to see the difference between the principles of *extracting* at the roof line and *forcing out* at the roof line; but later on in the paper we find a sort of explanatory note. The air in the building is compressed to the extent of $\frac{1}{20}$ to $\frac{1}{10}$ of an inch of water, and so, should there be any leaky joint of a drain or soil pipe, sewer gas cannot escape, the external pressure being the greater. Ventilation by extraction acts in just the opposite direction, and sucks out sewer gas from faulty plumbing work. The fallacies of the arguments are apparent to me, and probably are already to you. To maintain a pressure of $\frac{1}{10}$ of an inch of water in a room by means of a fan means that the exits must be smaller than the inlet, so that the pressure accumulates, and at first one does not see the object of this arrangement. But it becomes startlingly apparent when the faulty plumbing comes in, and it is evident that it is for the sole purpose of guarding against Glasgow plumbers that the air of the infirmary is maintained at this undue density. But supposing such an internal pressure valuable sanitarily, would not the opening of a door or a window upset the system by releasing the pressure? I think, too, that the provision of an abnormal atmospheric pressure upon the house side of a w.c. trap is a distinct mistake. Seals of traps are not too deep as it is, and with the house side further depressed and part of the proper seal sent down the branch soil-pipe, it appears to me that the impulse of shutting a door or of the closing the outlets for a few seconds might easily unseal the trap, and would certainly do so if coincident with a flush on the same stack from another floor. The convenience of being able to filter the air as it comes in, and to warm or cool it, is undeniable, but the same is arranged for in most systems. Upon the whole, ventilation by propulsion appears to me to be imperfect and undesirable, as, besides the difficulties attending the maintenance of pressure, it is no cheaper than using the same fan and engine for extraction, requires the same attention, and is just as costly to install. I think I may leave the subject of fan ventilation, as it distinctly contravenes one of the rules of our code of essentials—viz., that it shall be cheap to install, and be easily worked by an unscientific person. Still, I look upon ventilation by extraction, by a fan worked by a gas-engine, as one of the best methods *under certain conditions*, and I believe it will come more and more into use. But it is not a popular system, suitable, as I have said, for the cottage and the mansion. The method I advocate, and arguments in the favour of which I wish to place before you in this paper, is an old one—the very oldest, in fact; but its successful application in the particular direction I desire to describe has until recently been difficult. The problems I think requiring solution are those attending the proper and economical utilisation of heat to ventilation. As I say, it is the oldest system, as old as time itself. The aëration of the entire earth is effected by it. The winds which sweep through crowded alleys and courts, scattering the stagnant exhalations of many lungs, of much filth, and possibly of much disease, are the heaven-sent disinfectants, and their sole motive force is heat. The almost imperceptible breeze which creeps amongst, and yet scarcely stirs, the blades of grass; which carries the tiny green shoots their diet of oxygen and removes the resultant impurities, or, it may be, brings the change of diet, and, parting with its load of carbon, is revivified by the plant itself—this gentle wind has no cause but heat, and but for heat would not exist. With such examples, surely we cannot be wrong in looking to heat as the true and natural source of ventilation. Those of you who listened to Dr. Carpenter's Presidential Address last December will remember the keynote which pervaded the whole, and which rang out with especial clearness as coming from a man of his position and experience. Dr. Carpenter pointed to *Nature's* method as our great example in sanitary matters, to the evils which always ensued upon a deliberate disregard of them, to the perfect results achievable by their observance. And civilisation is proving this day after day. We are trusting more to Nature, less to art; more to pure living than to drugs; more to air and water than to artificial disinfectants and patented "germ-destroyers." We recognise Nature in the *requirements* of ventilation. I do not believe that we can have a better teacher in this *accomplishment*. We do not often consider to what a great extent the earth's surface is

aërated by means of heat, of the gigantic scheme working out around us. In my own mind I am convinced that the means arranged for effecting movements of atmosphere are explanations of many phenomena. The differing specific heats of bodies and the variations in their conductivity are, in my opinion, but parts of the great plan of ventilation, by which a mass of air in contact with two differing bodies will of itself commence a rotary motion, exposing to each surface constantly changing molecules. Supposing the atmosphere to be still, it pre-supposes an absolute similarity in the influences at work on it in all directions; and as in most cases this is obviously impossible, it is evident that the air must be moving, imperceptibly to us, but still in motion. Thus, in every corner of the garden where an exposed leaf is wet and a protected one dry, between them the air is being caused to move by the influence of the two leaves. In a room the air will be dropping by gravity down the polished furniture, and be rising up the flock-papered walls towards the ceiling. In the street, where a brick house and a stone house leave an air-space between, the steady effort towards equilibrium (which will never be reached) is being made, and the air, condensed by the cooler surface, forces the lighter air to rise. It is difficult to bring this to the light of an experiment, but I succeeded, I think, on one occasion in producing the result. My apparatus was a wooden box with a glass front, the wood of the back opposite the glass being covered with cork. Within a sixteenth of both the glass and the cork, and parallel with both, were two gossamer threads hanging on to the glass and cork, but kept away about the sixteenth. The box was as airtight as I could make it, being painted several times and varnished. My theory was that the bellying up or down of the threads would show the movement of the air under the influences of the opposing surfaces of cork and glass. As I say, I think I succeeded, as the curvature of the thread attached to the glass remained downward, whilst a very apparent upward curve was produced by what I took, and now believe to be, the current of air rising on the cork side to compensate for the condensing effect of the glass. I did all I could to protect the box from unequal luminous heat, and only took rapid observations, so that the heat of the face should not affect it. Imperfect as was the experiment, and perhaps unworthy of being presented to a scientific society, yet it made me the more certain in my mind that the system of aërating provided by the Maker of the universe is far more wonderful and far-reaching than we, as a rule, think it. I need not go into the question of the cause of winds and such-like disturbances in the earth's atmosphere. As heat does not exist unless something exists for the heat rays to impinge upon, so the sun's rays do not produce heat until they reach the earth, and the radiation from thence causes the disturbance of atmospheric equilibrium which originates wind. It is enough to say heat is the natural, and the only natural, way of effecting atmospheric movements, and this natural way is *direct application* (direct as opposed to the use of heat through mechanical media). It is the most efficient and most economical mode of ventilation. There are many ways of utilising heat in this direction. From the time when our ancestors crouched round a blazing fire in the centre of their huts, and allowed the smoke to wander away through a single hole in the roof; from the time when our fathers sat as children inside the ingle nook, and the enormous draught caused the invention of those high-backed settles and Brobdingnagian armchairs, up to now, when the Houses of Parliament are ventilated by the impetus given to the column of air in an enormous shaft by a glowing mass of coke at its base: the natural reason (may I call it *instinct?*) of the human race has led them to heat as a means of ventilation. For centuries they simply obeyed the knowledge which pointed out that the combustion of fuel produced a certain sensation which made their rudely-fashioned houses more comfortable; but they were unconsciously obeying the mandates of the great Sanitary Inspector who had made it impossible for them to obtain heat without at the same time effecting ventilation. To build a fire at the foot of a shaft is now the method adopted in many buildings for extracting vitiated air from the various rooms, and with more or less success. When the flue from the heating apparatus is utilised as a duct into which to run separate flues from the rooms, the success, as a rule, is not very apparent. Either the furnace has its draught lessened to an injurious extent by the numerous openings into it, or the consumption of fuel becomes excessive. The plan of encircling the smoke-flue by an auxiliary shafting into which the horizontal flues run is good in theory, but does not work out well, as the heat around the central flue is seldom great—indeed, often not hotter than the products to be extracted from the rooms. A better plan is to adopt a sort of siphon system, such as was introduced and patented years ago by, I think, a Mr. King. In this system the air-shafts from the rooms communicate with a main vertical shaft, closed at its upper end, and opening in the basement into a chamber, which is accessible from the basement only by a well-fitting door. In another corner of this chamber the furnace is erected, from whence a second shaft runs upward, to a greater height than the highest room in the building. Thus, in the first instance, by leaving open the door into the basement the fire can be lighted, and would obtain air freely; but as soon as the fire products had attained any degree of velocity, the close-fitting door is shut, and the column of air in the cold shaft commences to fall by its own gravity. This is just a question of the relative weights of the two columns of air, and the arrangement can be made to work well. Another plan which appears extraordinary in these School Board days is the construction of a sort of pigeon-cot on the roof, and in this to insert a coil of steam-pipe. In this cupola all the ventilating shafts from the rooms terminate, and the heat of the steam-pipe is supposed by some unknown law to suck up the air from these shafts. The way to utilise such an arrangement would naturally be to send a steam-jet through an opening out of the cupola, which would induce a draught. You will perceive that although these methods are all based upon the theory of ventilating by heat, yet they do not at all comply with what we have laid down as requisite for a practicable system to be used under all circumstances. They are not cheap, and although controllable by closing outlets, &c., could never be generally adopted for small dwelling-houses. They also require constant attention. But there is another way of applying heat to ventilation—cheap, automatic, and suitable for all classes of buildings. This is to utilise the heat of gas-lighting. Gas is now so general that we may consider it almost universal; but in country places where petroleum is the only means of lighting my remarks may be deemed to apply equally to it. I am able to say definitely that the amount of gas (whether from coal or from petroleum) which will *light* a room adequately will *ventilate* it adequately. Only the system must be a good one. If it is to be successful, there must be no rule-of-thumb work; but to install it properly is no more expensive than to fit it up in a manner which will insure failure. It is a matter which has received little attention, and for want of such attention has been relegated to the background. The difficulties in the way have appeared insurmountable, and many architects, after considering, and perhaps trying, the system, have become doubtful. The installation has been expensive, as flues have had to be bedded in non-conducting material to prevent danger, and it meant pulling a building to pieces (if not being lighted *de novo*). Then the lights wore out, required new burners, cleaning, and were generally rather inaccessible. The difficulty of preventing down-draught, too, was great, and to overcome this the flues had to be carried in a serpentine way round the building and up the roof until the flue-top could look triumphantly down all the neighbouring chimney-pots. This generally stopped a blow *down*, but just as certainly stopped any draught *up*. All the heat of combustion was absorbed by the shafting before it had gone many feet, possibly condensed, and in that case dropped in water, and spoilt the ceilings and tempers of people below. Ventilating by gas lighting was looked upon as a nuisance, and extravagant pendants, fitted with fishtail burners which blackened the ceilings and also the reputation of gas lightings, were, and are, to a large extent, looked upon as the most scientific and useful way of using gas. But all the faults I have named are non-existent in a properly-arranged system; the installation is cheap, and the results in lighting and ventilation most satisfactory. The ceilings and decorations are preserved, and architects can, by selecting such a system, insure those two desiderata, good light and good air, with which no building, be it as noble as the S[illegible] Law Courts (where I am told the windows [illegible] open, and where the accumulated sigh[illegible] defeated suitors form the only atmosphere), [illegible] useful as the Rotunda Lecture Hall, can r[illegible] the admiration of the public. A ventilating [illegible] light must be without glass or breakable ma[illegible] if fixed at such a height as not to be acce[illegible] at all times, and must be easily lighted [illegible] below. It must be shadowless, and be [illegible] ceptible of being reduced in power to suc[illegible] extent as to give off a heat of not more [illegible] 100deg. at 6in. above the point of ignition [illegible] it must be capable of being increased unt[illegible] full power causes an intake sufficient to fi[illegible] room with fresh air in ten minutes. The [illegible] ing from the light must be such that its ext[illegible] heat is practically *nil*, whilst the int[illegible] temperature must be very high. Its [illegible] must not disfigure the building, and [illegible] be arranged so as not only to pr[illegible] a *blow* down, but a *suck* down, or h[illegible] great enemy an external compression. [illegible] features (which are quite indispensable) c[illegible] arranged by the aid of recent inventions, n[illegible] indeed, all the previously conceived objectio[illegible] ventilation by gas may be obviated. The g[illegible] which I have found to answer best is the ve[illegible] flame system of William Sugg. This a[illegible] burners of steatite, that extraordinary mat[illegible] which, soft as meerschaum naturally, att[illegible] maximum hardness when heated to the me[illegible] point of cast iron. It is non-conducting [illegible] practically everlasting; non-corrodible, an [illegible] alterable in dimensions by heat or col[illegible] cluster of such burners up to the rec[illegible] greatest power are placed immediately belo[illegible] mouth of an extracting shaft, communicin[illegible] direct with the open air either perpendicula[illegible] horizontally. You will probably, and natur[illegible] think that a flame burning vertically close [illegible] ceiling wastes the greater part of its light po[illegible] the cornice of the room, but it is not so. [illegible] experiments made by Mr. Dibdin (Chemist [illegible] London County Council, and who is fast a[illegible] ing the rank of one of the first scientists [illegible] day) prove this conclusively. He found, an[illegible] stated before the Society of Arts, that the ang[illegible] 45° to the vertical of the flame under test ga[illegible] the greatest result in light. In the ing[illegible] ventilating light of which I speak, the dow[illegible] rays at that angle cover the outer area, whil[illegible] upward angle rays are returned to the[illegible] immediately below the light by an enam[illegible] iron reflector. Thus a result in light of re[illegible] brilliancy and economy is obtained. The h[illegible] combustion, being enormous immediately [illegible] the flame, ascends through the aperture pro[illegible] vided, and travels along the shaft. Now th[illegible] shaft is the subject of a further patented invent[illegible] and is lined throughout with a material kn[illegible] asbestos felt. This absolutely prevents any [illegible] densation (which occurs when the products [illegible] the bare tube, and which is not at all preve[illegible] by covering the *outside* of the tube), and [illegible] only so, but utilises the great princip[illegible] ventilating — viz., the conservation of [illegible] Not only is the outer case kept *cool*, bu[illegible] inside is kept *hot*, and whether the sh[illegible] horizontal or vertical, the heat is sustained [illegible] little loss through its length. At a suitable [illegible] communication is restored between the inn[illegible] shaft and a tertiary flue or casing which [illegible] into the room round the ventilating light [illegible] with the impetus gathered from its trave[illegible] you will remember it is not losing heat) the [illegible] cone of hot air rushes out, causing an aspir[illegible] in the outer air tube equal to the action of ga[illegible] of wind at a happy angle upon an oper[illegible] Thus, by aspiration and expansion, air is [illegible] from the room in quantities controllable by [illegible] turning a tap, and the output varied [illegible] 15,000c.ft. per hour to 300,000, for a foot [illegible] in such an apparatus as I have describe[illegible] extract nearly 3,000 times its own volume [illegible] The question of "back-draught," or "[illegible] draught," is one which will occur to m[illegible] you, and it is an important one. We can [illegible] blow down with a cowl, but what cowl wi[illegible] air from passing down it if sucked into th[illegible] by some force greater than the wind's actio[illegible] the cowl? If a fire is burning at the foo[illegible] tall chimney, the outlet of which is highe[illegible] the cowl, how can we prevent the fire [illegible] drawing its air supply from this convenie[illegible] cowl-protected inlet in the roof? As I ha[illegible] before, no cowl of itself may stop it. But [illegible] ventilating light scheme the difficulty i[illegible]

inted by the insertion in the cowl of a disc of
: or similar material, which is perfectly flat, and
's upon the end of the shaft, which, being care-
.y and squarely cut to meet it, makes a sound
it, airtight against any *external* air. The
: is threaded on a central pin, and is attached
no other manner, nor can it become rigid in
· way. Now the theory of this valve is bound
with that of the non-conducting lining; each
to some extent, imperfect without the other;
together they utilise that power which has, I
ık, never before been brought to bear on ven-
ting lights. This is the *conservation of heat*
eady mentioned. You are aware of the rule
ich makes hot air ascend—it is simply pushed
by the weight of cooler air descending, and
impulsive force of heated air is according to
degree to which it varies from air at normal
perature. We will instance a column of air
square by 20ft. high. This weighs about
144lb. What keeps this column of air from
ng will be the fact that neighbouring columns
ir the same dimensions are at the same tem-
ature. We will consider such a column as
ıg contained by a non-conducting shaft, 20ft.
g by 1ft. square. This we will suppose to be
jected to heat; but before applying the heat
close the top of the column with a flat plate
ıo weight, and on this place shot of known
ghts. When the heat is started the air in
column expands, and at first the surplus con-
s flow out at the unclosed end. The hottest
rises up the shaft to the top under the plate,
a pressure is exerted upon this plate equal to
difference in weight between the heated air
he column and a similarly sized column of
eated air. If our column of heated air is at
, then we have doubled its volume, halved
lensity, and obtained an upward pressure of
its weight, that being the difference between
heated column and an imaginary cool column.
f the plate we speak of is weighted to ·7 of a
nd, still the upward force will lift it, and, *nota*
, if a down-draught presses upon the plate to
extent *less* than the upward impulse, the plate
still be lifted up and the exit take place in
: of down-draught. This plate is repre-
ed in our ventilating scheme by the exit
e, the disc. We will suppose an external
pression of the atmosphere to exist, which
s this disc valve tightly on its seat; then the
ed products from the ventilating light fill the
right up to the valve, and, losing very little
by the absorption of the shaft, continue to
ıotter until the upward pressure exceeds that
ne down pressure, forces it back, and makes
Should the down pressure be severe, as
as it does not exceed the ·8 or ·9 per square
the conservation of heat soon reaching
or 500° will cause an exit to be forced.
: a down-pull on a ventilating outlet may be
come, and, with these inventions, ventilating
may be made in places which have been
acticable hitherto. But we have another
ant in this matter: the exit valve spoken of
aced in one of the powerful Sugg cowls
e mentioned, so that not only does the light
e extraction, but the cowl does its work when
ght is going. Its working is such that the
passing of a wind across it will cause
ction, and keep the valve balanced in the
nt, until a cessation in the upward current
the consequent threatening of a down-
ght will restore it to its seat. But you will
vith reason that such a cowl extractor with a
y wind will cause undue ventilation. By a
e mechanical arrangement the exit valve is
posed situations made to act as a regulator,
ı allows free outlet so long as the fixed out-
: not exceeded, but, under a violent extrac-
closes the orifice in proportion to the
ased suction, keeping the output regular
unaltered. For about two years some
nese have been in work, and have never
l; nor can any traces of wear or dis-
be perceived. Apparently they are as
as ever, although exposed to the full
of ventilating lights (in one case within 3ft.
e flames). As regards the efficiency of this
n of gas ventilation, I examined recently
tallation at the Grosvenor Museum, Chester,
ce unventilated lights had been removed.
is case the committee, sitting under the pre-
cy of the Duke of Westminster, and the
nanship of Sir Horatio Lloyd, has carried
xtended experiments in the rooms of the
nical Education Department, and authorised
ɔnorary secretary, Mr. J. R. Griffiths, of
er, to give a certificate to the effect that the temperature of the rooms did not rise one degree with the rooms full of students and after hours of work. The lighting was characterised as perfect. The question of air inlets must be answered; but I should hesitate to advocate the arrangement of a greater area of inlet than outlet, unless circumstances precluded the ample distribution of the inlet orifices. The plan I recommended lately is, I think, as good as any. In this case the grounds of the skirting were cut through, and the board itself perforated in an ornamental manner at intervals. The floor boards should be cut short, so as to allow free way from between the joists to the space behind the skirting. In the outer wall of the room air bricks are set, and from each a light zinc shaft runs to the centre of the floor between the joists, terminating at an open end. Thus the suction above is exercised equally all round the room, and the incoming air is fairly well modified in temperature. In an existing building the inlets must depend upon the circumstances, but distribution must be the point considered. With control of the light you have control of the inlets, and the whole matter is regulatable. There appears to be no one of our conditions with which ventilation by gas-lighting does not comply if carried out as I have described. It is cheap (?) if put in when the building is going up, the light itself being the only item of cost worth considering. It can be fixed almost anywhere, and can be made to work well. At one stroke the lighting and ventilation is accomplished, and you have the best of both. There is no advantage claimed for electricity which is not possessed by gas so used—cleanliness, coolness, and efficiency—and comparison does not exist upon point of cost. Every small house could be fitted whilst building with the shafting, leaving the tenant to select his light, and this he could buy at as little cost as a gaselier. Finished houses can be ventilated without pulling them to pieces, and the parts of the system which would be considered fixtures and unremovable are the cheapest parts of the installation. The light may be in powers from 16 to 2,000 candles, and will last for years. There is no danger in their use, and gas explosions from sliding and other imperfect chandeliers are abolished. You only pay for gas (less than you would for a less scientific system), and you get ventilation into the bargain. You have an ever-ready mechanical force which will at any time educt vitiated air from the room by the simple means of a lighted match and a turned tap. Ventilation by gas is emphatically the method for large or small buildings or shops, and for all situations where persons have a regard for their health, for their eyesight, for the cleanly appearance of their ceilings and walls, and for their pockets.

NOTES ON TERRACOTTA.*

ECONOMY.

THE use of terracotta may be made a source of considerable economy, depending entirely upon the design. If the general details be elaborate and largely varied, necessitating the making of many models and moulds by the manufacturer, the work is likely to cost nearly as much as if it were in stone. But if the general features be repetitive a considerable saving may be effected. This can be generally done in string-courses, labels, arches, pateræ, balusters, and similar details. In original work (*i.e.*, work not moulded or pressed) very little saving is likely to accrue, for the manufacturer, in pricing the work, has to make a provision for the possibility of failure from the time it leaves the hands of the modeller until its output from the kiln. None but those who have spent a portion of their lives in terracotta works can form an adequate idea of the loss and waste of material from misadventure, especially in the kiln. In all terracotta works are to be found a large and varied assortment of ornamental stock patterns, chiefly in brick sizes, by the use of which in any design a saving may be made. This is largely practised in the vicinities of terracotta-producing districts, where the stock patterns may often be seen worked into villa residences with good taste and pleasing effect.

DRAUGHTSMAN.

In large works doing much business several draughtsmen are employed, each one having his own particular jobs to look after, the work in connection with which, from the receipt of the architect's drawings until the consignment of the material to its ultimate destination, is, or should be, under his immediate supervision. He should be thoroughly practical in stonework and brickwork, familiar with bonding and jointing, an accurate knowledge of which will furnish good results in his work. Solid geometry—especially that part of it which applies to penetrations and developments—is invaluable in determining intersections and true forms. His first duty is to make ½in. scale drawings of the various elevations to be treated (this being the most suitable scale for the purpose). On these drawings all the work should be "jointed up," that is to say, all the joints throughout the elevations should be expressed or shown; and, in addition, the various blocks into which the work is divided can be indicated, alphabetically or numerically, as best suggests itself. This drawing should be kept for the exclusive use of the draughtsman, affording him a ready means of vindicating his mode of working, showing the progress of the work in hand as well as enabling him to readily trace the material in the progress of manufacture by means of the numerals or letters written thereon. Before putting any of the work in hand, a tracing of the ½in. scale drawing should be submitted to the architect for his approval of the proposed jointing and various other treatments. If this were done in all cases much future trouble might be obviated. Upon the return of the ½in. scale tracing with the architect's amendments (if any) indicated thereon in red ink, a tracing should be taken from it as a key plan for the use of the builder's foreman; and in any correspondence taking place between the manufacturer and the builder relative to this matter, the numerals or letters of the key plan should be carefully quoted.

Separate full-size clay drawings so-called should now be made for each block differing in form from the other blocks. The dimensions for these are taken from the "shrinkage rule," which is so graduated that a piece of terracotta in the clay state measuring 2ft. by the "shrinkage rule" will, when burnt, measure 2ft. by the ordinary rule. The amount of shrinkage allowed is generally one-thirteenth of the whole. But as all clays have not a uniform shrinkage, each works has its own "shrinkage rule." The common form of rule in use is 26in. long, one side being divided into twenty-four equal parts, representing inches, and which is called the clay-rule; and the other side into twenty-four ordinary inches, with a two-inch blank at one end. This side is called the ordinary rule, and, as implied by its name, is ordinary measure. Rules of this kind bearing the ordinary and the clay measure should not be used; they are productive of many mistakes in the setting out of the work, which are sometimes not discovered until the material is burnt and delivered upon the building. A separate rule in each case will be found best. Models and moulds are now made from the clay drawings, truthfully representing the intended work, but one-thirteenth larger to allow for shrinkage. This done, subject to the approval of the draughtsman, piece-moulds in plaster of Paris are taken off the whole work in the same way as for under-cut ornament in plastering, and are used in a similar manner for the reproduction of the forms in clay. Vexatious delays are now looked upon as inseparable from the use of terracotta. These should not occur under a proper system of management when the architect's drawings are delivered at an early stage of the building works, and the manufacture of the material is at once put in hand. To provide against wreckage in the kiln, or damage in one of many ways, a few extra blocks or pieces should be made in excess of the actual number required, the cost of moulding or pressing a few extra blocks being very trifling indeed. In building works of any magnitude a sum should be provided in the bill of quantities to defray the wages and expenses of a really practical man to be selected by the architect or the builder, and located on the terracotta works to watch the exclusive interest of the building represented by him and urge forward the work. As an additional means of tracing the material each contract should be assigned a distinctive letter of the alphabet, and all work for that contract while in the plastic state impressed or stamped with its representative letter, or the initials of the name of the building for which it is intended. The draughtsman, when ordering his work of the presser and finisher, should do so by furnishing him with a printed docket on which he has previously

* All rights reserved.

sketched the block or blocks to be made, the quantity required; the name of job, draughtsman, and date should also be marked thereon, the draughtsman keeping a counterfoil of each docket supplied.

HOT-WATER ENGINEERING.—XVIII.

Supply of Hot Water for Baths and Domestic Purposes.

taps (concluded) and other appliances.

THERE has been recently introduced a new tap, which promises well and certainly seems practical, but the greatest hesitation must always be felt in speaking of these appliances, favourably or otherwise, until they have been in use a little time under ordinary conditions. This tap is Sir William Thomson's patent, and Fig. 59 illustrates in section its parts. This is a screw-down tap with a metal valve, A, which screws down upon a metal seating, B, and no rubber or composition material is used to make the joint here, as is usually the case with screw-down taps. The valve and the seating being both of metal, it follows that some provision must be made to keep them both true and of exactly level surface; otherwise there would, of course, be a leakage in a very short time. Metal valves and seatings have been tried many times, but with so little success that practically everyone now uses a yielding material on the valve (closing upon a metal seat), so that any little inequality upon the surface of the seat is made up, and no leakage occurs until the material on the valve, rubber, leather, or composition is worn out and requires renewing. This applies to taps which have the valve portion closing direct and dead upon the seating. With the tap now being treated the difficulty is overcome in an ingenious way: the valve and seat, instead of closing abruptly together, first meet with little pressure

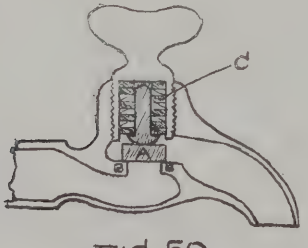

Fig. 59.

due to the valve being beneath the spiral spring C, then as the handle is screwed down still farther the spring becomes more compressed, and ultimately cannot permit of the handle being screwed further. After the valve and seat first meet about two more turns can be given to the handle, and these two turns cause the valve to rotate upon the seat. This is the vital point in the tap, the makers claiming that as the two surfaces are thus equally ground together each time the tap is opened or closed, they cannot become irregular or unsound, and until the two parts are actually worn away no leakage can very well occur. This sounds well, and one or two good engineers in London have spoken well of the tap; but the writer fears that the deposited matter from hard waters will be found seriously injurious. It is this hard matter that has, and still does, injure all other taps that have two metal surfaces working one against the other. It is this substance washed through the pipes in the form of grit that causes leakages with ordinary plug cocks. Very many users of baths wish for a shower attachment to be provided that a shower bath may be had when desired. This under the old arrangement was an awkward and clumsy contrivance, consisting of a circular tank or container suspended over the head of the bath, that is, in the most convenient position for those who intended using it, and this after being filled with water was, by a trigger arrangement, discharged over the person standing beneath. The bottom of this contrivance was perforated with fine holes, so that the discharge assumed the nature of a shower correctly, but here its good features ended. The particular objection to this reservoir was the trouble or inability to ascertain the temperature of its contents. For a cold shower it was very good; but if a tepid or warm shower was required, it was necessary to ascertain the heat of the water, otherwise the results might be unpleasant or even dangerous.

The more modern form of shower attachment is as Figs. 60 and 61. This consists of a board of some polished wood, with a metal arm and rose projecting from it, and the taps for regulating the supply of water are conveniently within

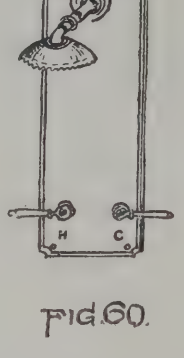

Fig. 60.

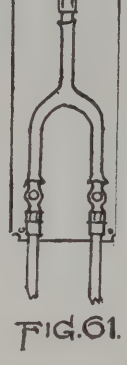

Fig. 61.

reach. The second figure shows the connections which are effected at the back of the board, out of sight.

It will be seen that the hot and cold service pipes are brought from the nearest points (they are usually branches from the bath services) and connected to the taps behind the board; from the taps they are continued a little way up the board and then joined, as shown, just before the connection is effected with the shower arm.

Fig. 62.

This makes the most convenient and sightly arrangement possible. The temperature of the water can be regulated to the greatest nicety, or, what is oftentimes particularly sought for, the shower can be commenced warm and gradually reduced in temperature until quite cold. The duration of the shower is also quite at the bather's pleasure. Of course, this attachment necessitates the bath being against a wall either at one side or end, but this is nearly always the case; a bath in the centre of the room is unusual.

If desired, a shampooing union (with rubber

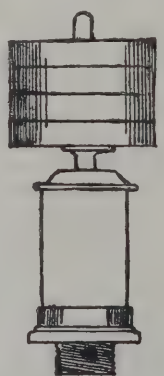

Fig. 63.

tube and rose) can be very easily attached to the same board. This is a very useful appliance when bathing children; or it will afford a ready means of rinsing out the bath after it has been used. These more modern shower appliances are kept by almost all the plumbers' fittings makers.

safety valves.

The variety of safety valves is at p limited to four, not including the fusible These valves are not used at all largely, n what they are desirable appliances, but fo reason neither the range maker or hot-wa gineer shows any interest in them. A valve, if properly used, would without fa vent a boiler explosion, whatever might cause, and as boiler explosions are usua tended with loss of life, it is to be wonde that the range user is not more anxious. ably the rarity of these accidents has som to do with it.

When a safety valve is fitted there is vailing idea that it remains an element of for ever; but this notion is very wrong, considerable number of existing valves permit the boilers to explode before they o This would happen when a safety valve ha fixed several years and never been used tended to. In this case the seating of the whatever it might be composed of, wo stuck fast by age and non-use, and no force would move it. Safety valves, parti those with metal seatings, should be clean tested occasionally; when the boiler is cleaned is a good time, for the testing b cannot very well be done unless the wo is at liberty to draw off the water after The reasoh for this is that when the v lifted or opened and water issues (an ind that it is in good order), upon releasing joint most likely will not make itself again owing to some accumulation or falling in between the surfaces. When valve is attended to or tested it usually that the seatings must be cleaned before become watertight again.

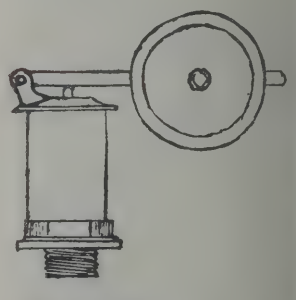

Fig. 64.

The position for a safety valve is in the but the boilers are usually so placed that cannot be directly screwed into them, short length of pipe has to be used. The objection to this provided the pipe is o size and is taken from the top of the boil the pipe was taken from a low position boiler its entrance would become choke "fur," supposing hard water was used writer has always been in favour of bring pipe through the range covings, so th valve is nearly over the fire; in this positi water issuing from the valve (should a dan feature cause it to open) would extingu fire. By this means the valve not only the boiler, but by putting out the fire p all further risks.

There are one or two firms who reco placing the safety valve on the cylinder, apparatus is on the cylinder system. It presumed that they have good reason fo although it is not obvious. In the first cylinder never bursts, and it is the boile that is accountable for what fatalitie hitherto occurred. Now, as an accident due to something that occurs between the and cylinder (stop-cocks in primary flo return, for instance), placing the valve cylinder would be useless. Of course, if t sible cause of a burst occurred somewh above the cylinder there would be every hood of the valve on the cylinder savi boiler; but as it is the boiler only that bu naturally follows that the boiler is the place to attach the valve to.

Occasionally an accident will occur to a der without injury to the boiler; but let it explained that this would not be a case of ing. Cylinders collapse, which is just t posite to what occurs to boilers; and to p

llapse an *inlet* valve would be required to ve the pressure from without.

he collapse of a cylinder might occur in this : If by any means a cylinder was exhausted ater, emptied while the fire was alight and e was water in the boiler, this water would furiously and drive volumes of steam into through the cylinder. Now, to exhaust a ptacle of air, few methods are better than in- ing steam into it, consequently, while this ion is going on the cylinder is practically ex- sted of air, but filled with steam. If at this nent cold water flowed at all rapidly into the nder the boiling would instantly cease and steam would be condensed, creating a uum. This would cause the pressure of the ernal atmosphere to exert all its force to sh the cylinder, which it would effectually do, his amounts to 15lb. pressure to every square h. A cylinder acted upon in this way be- nes crumpled and crushed in like cardboard.

e safety valve mostly used is the spring de- ption, as Fig. 62. This is shown in section : s the outer casing, having an external thread bottom, usually ¾in., and a screw cap B at . Inside at the bottom is a seating C, as wn, and from this seating a pin extends up through the centre of the screw cap at top. e force that keeps the seating tightly in posi- n is furnished by a spiral spring extending m top to bottom inside, around the centre . This spring, as will be seen, is compressed re or less by screwing down or unscrewing top cap. By means of this cap the valve be regulated according to the pressure of er that exists. The supposed weak point in s valve is the spring, which perishes in course time, but which can be supplied new at any ue for a few pence. It is the neatest valve we re, occupying the least room.

The valve which has the next greatest use is "dead weight," as Fig. 63. This has a ing, inner seating, and centre pin almost ctly like the last, but no spring. The pres- e to keep the seating sound is furnished in s case by weights placed upon the centre pin, ich extends up some inches above the top of valve to receive them. These weights are cular pieces of iron about 3in. wide and ½in. ck ; four or five are used according to the ssure of water that exists normally. This ve is not credited with having any weak nt. It is a very safe valve if attended to iodically, but it is not so sightly as the last.

Another valve is the lever form, as Fig. 64 ; s is a very safe valve, but little used owing to room it occupies. It is, of course, familiar everyone who has examined steam boilers. e body of this valve is similar to the last, but required pressure upon the pin of the valve rnished by the weighted lever as shown.

An ingenious valve is as Fig. 65. This is wn in section, and practically consists of a gth of pipe with a diaphragm in it. This phragm consists of a thin sheet of copper perly secured, and safety is insured by having diaphragm sufficiently thin to become ctured should an unsafe pressure be exerted. ordering this valve the normal pressure or id of water has to be stated, and the makers en supply a diaphragm suited to bear this, but y little more. This valve would not require ention or cleaning.

The last safety appliance to be mentioned is "fusible" plug. This consists of a rather all circular brass frame, which is screwed in- e the boiler. This frame contains a disc of an oy which melts at a temperature a little above at of boiling water, and when melted leaves a ar aperture through the brass frame for the cape of steam or water, whichever should hap- n to be ejected first, as the boiler relieves elf. Many people think that a fusible plug only suited for instances where a boiler may come empty, but it has to be explained that it just as good a safety valve when the apparatus full of water and likely to have an explosion m some other cause.

As just mentioned, the fusible disc is made of alloy (bismuth, &c.) which melts at a tem- rature but little higher than boiling water, y at 300°. Now, supposing some stoppage curs and a great pressure begins to be exerted, e temperature of the water will rise cor- spondingly, for the heat of water is only ited to 212° when it is subject to atmospheric ssure. If we heat water in a closed re- ptacle or apparatus (like a high-pressure heat- apparatus) we can get very high tempera- tures, even up to 500°, but the pressure when this heat is attained is enormous. When the water became 300°, sufficient to melt the fusible plug, the pressure would be 65lb. to the square

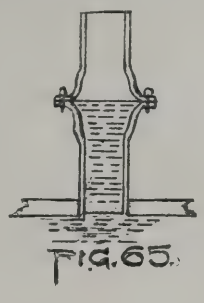

Fig. 65.

inch. This would not be sufficient to burst the boiler, so that safety would be insured.

It is doubtful if fusible plugs are reliable in hard-water districts, for should the disc get a coating of fur, which is a very poor conductor of heat, it is possible, in fact very probable, that the plug would be melted when no danger existed. The next paper will deal with sources of danger, faults, and remedies.

SANITARY SPECIALITIES.

MANY new and special features for sanitary purposes are to be found in the illustrated catalogues issued by Adams & Co., engineers and sanitary specialists, of York, whose offices are in Little Queen-street, Westminster, with branches at Manchester and Glasgow. The ventilating column is an appliance worthy the notice of sanitary authorities and engineers. It has a hollow cast-iron base with flange that can be fixed to concrete or stone, with a wrought-iron tube or column which acts as a ventilator. The base can be attached to a bend leading to sewer through which the noxious gases can escape. Within it, just above the pipe from sewer, one of Adams' patent sewer-gas disinfecting and deodorising apparatus can be fixed, which allows the current of air freedom, and at the same time deodorises the gas. The column can be used as a simple ventilator or have a cowl fixed at the top. A bracket gas lamp can also be attached to the column at the side. This combination of lamp and ventilator is exceedingly useful and inexpensive. It can be made to any size and form. Adams' patent automatic flushing siphon is a useful appliance for sewage or clean water. It can be started by a drop feed, is exceedingly simple and accessible in its parts, and as a flushing apparatus we can recommend it. It discharges instantly and quickly. For flushing house drains of various sizes this automatic siphon is well adapted, as it can be obtained of various sizes of outlet. Sections showing it fitted in flushing chamber are illustrated. The manhole cover or ventilator fitted with disinfecting apparatus for roads is simple, and the receptacle for liquid disinfectant, with asbestos wire hood dipping into it, is easily adjusted and got at. It is supplied to the Board of Works and other authorities. Other forms of it are shown. Adams' patent revolving disc penstock is a very simple and useful kind of apparatus ; the lift is by chain and ring, and the operation of raising very easy. The revolving door is raised by a chain passing round its grooved edge. Another kind is raised by a rack and worm. A very ingenious automatic flushing door, from 12ft. diameter upwards, of oval or square form, is illustrated on page 16 ; and we have also various improved forms of flushing valves. Adams and Co.'s egg-shaped tide flaps secure all the requirements of easy working and accurately fitted flaps for sewer outlets. Manhole and air-tight covers and gullies are also shown.

Another catalogue furnishes a variety of patented appliances. We must particularly draw attention to Adams' patent trough and flushing closet, used largely for schools, barracks, and workshops. The excreta is held in partial suspension, and is automatically flushed out at intervals by a patent flush tank fixed over one end of the range. The section of trough is well shaped to prevent splashing or back soiling, and the prices affixed show this to be one of the cleanest and cheapest forms of closet where the seats are numerous. The patent automatic flushing latrine is used where the open trough is undesirable. This form of latrine consists of a number of separate straight pans, oval in form, connected together, with division walls between. They are flushed out at intervals automatically. Several testimonials from surveyors and architects are appended of the working of this latrine. Wrought and cast iron flush tanks for cleaning drains with little fall, which are set in motion by drop to drop supply ; Adams and Co.'s disconnecting chamber, flushing gully, and improved siphon cisterns, are worth attention ; as also the numerous and excellent wash-out and other types of closet, hoppers, glazed-ware urinals, lavatories, and other patented appliances. Prices are affixed to each pattern.

CHIPS.

The pinnacles of Tenterden steeple, the erection of which is traditionally held to have been the cause of the Goodwin Sands, are undergoing reconstruction. Mr. Ewan Christian is the architect, and the contract is being carried out by Mr. Nunn, a local builder, who has just completed the rebuilding of the principal or staircase pinnacle.

A convalescent home for fever patients is about to be built in Pump-lane, Meanwood, near Leeds. The site has an area of 4½ acres, and at present will be made for 30 children and 10 adults. Mr. W. H. Thorp, of Leeds, is the architect, and the outlay on the buildings just commenced will be £8,500.

The Bishop of Lincoln reopened yesterday (Thursday) Frampton Church, South Lincolnshire, which for the last two years has been undergoing restoration.

At a special meeting of the Ilkley Local Board held on Friday evening, a scheme was considered having for its object the carrying out of a number of much-needed improvements, and the erection of town's offices, &c., the whole involving an estimated expenditure of £10,000, The scheme includes the laying out, fencing, and planting the Rhyddings as a public pleasure ground, widening and improving certain of the public roads, the building of a certain new depot and board offices, stabling, cottages, house for superintendent, a fire-brigade station, public slaughterhouses, stores, shedding, workshop, &c. The scheme was discussed at some length, and was adopted, subject to the sanction of the Local Government Board being obtained to the loan of £10,000.

Thomas Kennedy, builder, Plymouth, having filed a goods and cash account as ordered, was at Stonehouse Bankruptcy Court on Friday allowed to pass his examination.

The Wesleyan chapel at Fiskerton will be reopened next week, having been reseated, reflored, and redecorated. The works were carried out by Messrs. Horton Brothers, of Lincoln.

The school board for Wednesfield have instructed Mr. G. H. Stanger, of Wolverhampton, to prepare plans for enlarging the schools at Moseley village.

Mrs. Dutton, the wife of the chairman of the South-Western Railway Company, attended at Eastleigh on Saturday, and opened the new Railway Workmen's Institue, a building erected by the company for the use of their workmen, many hundreds of whom have just come to reside at that place, through the removal of the company's carriage building works from Nine Elms.

The new institute and reading-room at Willaston, Cheshire, was opened last week. It has been built from designs by Colonel David Walker, architect, of Liverpool, Mr. W. Pritchard, of Little Neston, being the contractor. The style adopted is English Domestic work of the 16th century, carried out in red stone for the ground-floor story, and half-timbered work above.

A Constitutional club at Eastleigh, Hants, was opened on Tuesday week. It is built of local red bricks with Bath-stone dressings, and has a ground-floor hall, reading-room, and refreshment bar, and on the first floor a billiard-room. Mr. Stanfield C. Greenwood, of Southampton, is the architect, and Messrs. Crook and Son, of Northam, near Southampton, were the builders.

On Wednesday week the Winsford Co-operative Society opened a new river warehouse on the Weaver. The building has been erected by Messrs. A. and H. Hulse, from designs by Mr. Cooper, architect, Winsford, and the work was superintended by Mr. J. Wilson as foreman.

Mr. Frederic Payne Watson, a former inhabitant of Leamington, died early last week at the age of 82. He had been known in Leamington for 60 years, having settled here early in the thirties as an architect, and subsequently was for some years town surveyor. He took a great interest in all connected with the advancement and welfare of the town. For some years, owing to failing health, he had resided at Bournemouth, where he died.

EDEN NESFIELD.—ROMAN CATHOLIC CHAPEL, HOLLINWOOD CEMETERY.—WAREHOUSE IN MITRE-STREET, ALDGATE.

Our Illustrations.

GRAND HOTEL AND ASSEMBLY ROOMS, BARRAS BRIDGE, NEWCASTLE.

The grand hotel and assembly rooms are designed distinct and complete in themselves, a large open yard intervening, and the only connection between the blocks being for service. The block towards Barras Bridge was originally intended for business and residential flats, and was adapted for hotel use as the work proceeded. The plan given is of the principal or first floor, the ground floor being let off for shops, excepting spacious entrance, staircase, buffet, smoking and sitting room. In all, the accommodation provided is fifteen public or reception rooms and fifty bedrooms, in addition to extensive kitchens and cellarage. The assembly-rooms are designed on two floors, the accommodation on each being a large ballroom, with reception and supper room contiguous. The cloakrooms in duplicate are on the ground-floor, the entrances and staircase being arranged to allow the ground and first-floor suites of rooms to be let separately or together. There are billiard and card rooms, together with ample kitchen and serving-room accommodation over supper-room, having lift communication, and, in addition, caretaker's apartments. The girders carrying the assembly-room floors are laid on special egg-shaped india-rubber cushions to afford sufficient "spring" when used for dancing. The buildings are warmed throughout with steam, the ventilation outlets being assisted by steam pipes taken to outcasts. The rooms are lighted with the electric light. The whole of the works have been carried out, from the designs and under the superintendence of Messrs. Lamb, Armstrong, and Knowles, architects, Newcastle-on-Tyne, by Messrs. Middlemiss Bros., contractors.

A RIVERSIDE PAVILION NEAR HENLEY.

This little building on the Thames, from the designs of Messrs. Elphicke and Howell, in local bricks and tiles, is clearly shown by the plate which we print from the architects' drawings to-day. A feature is made of a reading-room, with a spacious ingle nook fireplace in the central portion, affording a pleasurable refuge in wet weather, and, besides, it forms a useful adjunct to the tea-room by the side. Ample retiring conveniences for boating parties are provided. Mr. T. Dixon is the owner of the place.

COTTAGES, CADOXTON.

This row of cottages is about to be erected for a London syndicate, who will erect in the neighbourhood about 500 houses, the demand for which still continues. The contract price is £175 per house, the materials are local rubble stone external walls, partly slated roofs. The houses will be considerably above the road level.

OFFICES AT BRECON.

On the same plate is a view of a block of offices at Brecon. This building is an old cottage on the site, altered and enlarged for use as offices. The materials are rubble walling, half timber, rough cast, and red tiled roof. The architect is Mr. W. L. Griffith, Newport, Mon.

OUNDLE PARISH CHURCH.—THE SOUTH PORCH.

The parish church of Oundle is a fine example of a large 13th-century church, with insertions and additions of later periods. The Early English nave arcade is very fine. The aisle windows and clerestory, with the transepts and the chancel, are Decorated, and the spire and south porch are Perpendicular. This latter was added at the end of the 15th century, and in detail is peculiarly rich. The vaulting inside is a very good example of the period. John Begg.

ROTHWELL CHURCH, NORTHAMPTONSHIRE.

Situated in the midst of the quaint little town of Rothwell, which in itself contains such a wealth of good work, is this interesting church, though in a sadly dilapidated condition and much needing repair. Every period of Gothic is here represented, but, as is often the case, the "Third Pointed" work is by far the best—*vide* the fine east window of the sketch, which harmonises so wonderfully well with the Early work in which it has been set. The plan of the corner pinnacles of the east end is peculiar, from the way in which they are set with relation to the study of 13th-century buttresses below. The mouldings of this window are very full and rich in contour, and partake somewhat of the character of 14th-century mouldings. The sketch shows how in the 15th century the choir wall-head was raised and the east gable flattened—the old wall-head corbel-table and the carved bosses which once stopped the gable-moulding being still visible.

John Begg.

CHIMNEYPIECE BY THE LATE W. EDEN NESFIELD, ARCHITECT.

In further illustration of the works of the late Mr. W. Eden Nesfield, architect, we give reproductions of three chimneypieces and a sideboard. The chimneypieces are at Cloverley Hall, Shropshire, the mansion being fully described in former numbers. No. 1 is in the drawing-room, and is executed in statuary and Sienna marbles. No. 2 is the library chimneypiece, and is executed in Portland stone. No. 3 is the dining-room chimneypiece, which is carved in wainscot oak and Derbyshire russet marble, the chief interest of which lies in the central panel, which illustrates a numerous procession of servants bearing the various creature comforts to the dining-room. The cook, represented by the first figure, is supposed to have completed his cuisine duties, and is in the act of taking a pinch of snuff, and having a little banter with the others. The sideboard is one of various other works, both decorative and constructional, which Mr. Nesfield carried out for Mr. Henry Vallance, then of Farnham Royal. Previous illustrations of work at Cloverley Hall were given in our pages for July 17th this year, and a view of the house itself will be found in our issue for June 3rd, 1881.

ROMAN CATHOLIC CHAPEL, HOLLINWOOD CEMETERY.

This cemetery, belonging to the Oldham Corporation, contains three mortuary chapels, registrar's house, gardener's cottage, stabling, &c. The buildings, erected at a total cost of £7,760, are faced externally with Brighouse parpoints and Yorkshire stone dressings, with green Westmoreland slates for the roofs. The whole of the inside joiners' work is of pitch-pine. The chapels together form quite a group, each with its tower and spire, while the registrar's house, with its clock tower and the gardener's cottage, adjoin the entrance gates. The contractors were Messrs. Squire, Dunkerley, and Co., of Werneth, Oldham. Mr. Fredk. W. Dixon, of Oldham, was the architect. The drawing shows the Roman Catholic Chapel.

WAREHOUSE IN MITRE-STREET, E.C.

The premises are situated at the corner of Mitre-street and King-street, Aldgate, built for Messrs. Phillip Phillips and Co., cokernut and fruit merchants, of this locality. Mr. M. E. Collins is the architect. The premises were erected by Messrs. C. W. Ward and Co., of No. 10, Minories, and are constructed of red brick and Portland stone, the ground-floor piers and arches being Portland and red Mansfield in alternate ban The keystones, main entrance, and panels decorated with groups of fruit and foli symbolical of the trade. The peculiarity of t warehouse is that it has no shop front, the wh elevation being left open to permit of continu trade being carried on all round the premi with people in the street, there being count arranged to project on to the thoroughfare. T basement is exceptionally deep to permit of n being shot into the same, and the upper flo are well arranged, with the windows 6ft. ab the floor level, so as to give wall space ri round the apartment for piling up nuts, arrangi and sorting same. The building is roofed with an asphalte flat, and on top is an erecti kept back so as not to show in the street, specia constructed for carrying on the bleaching of nu This portion of the building is carefully seve from the rest, and rendered entirely safe fr fire, and being situate at such a height from surrounding property, the neighbours do not su any ill-effects from the various fumes aris from the bleaching. The premises are fitted w broad double fruit ladders and no stairs. powerful hydraulic elevator passes through building from top to bottom, and there are some hydraulic cranes, &c.

CHIPS.

To the many memorials which adorn the wall the north and south aisles of the choir of Y Minster, another has been added by Mrs. Luden memory of her late husband. The tablet, whic of marble, is of a simple description. The work been executed from designs by Messrs. Bodley Garner, London.

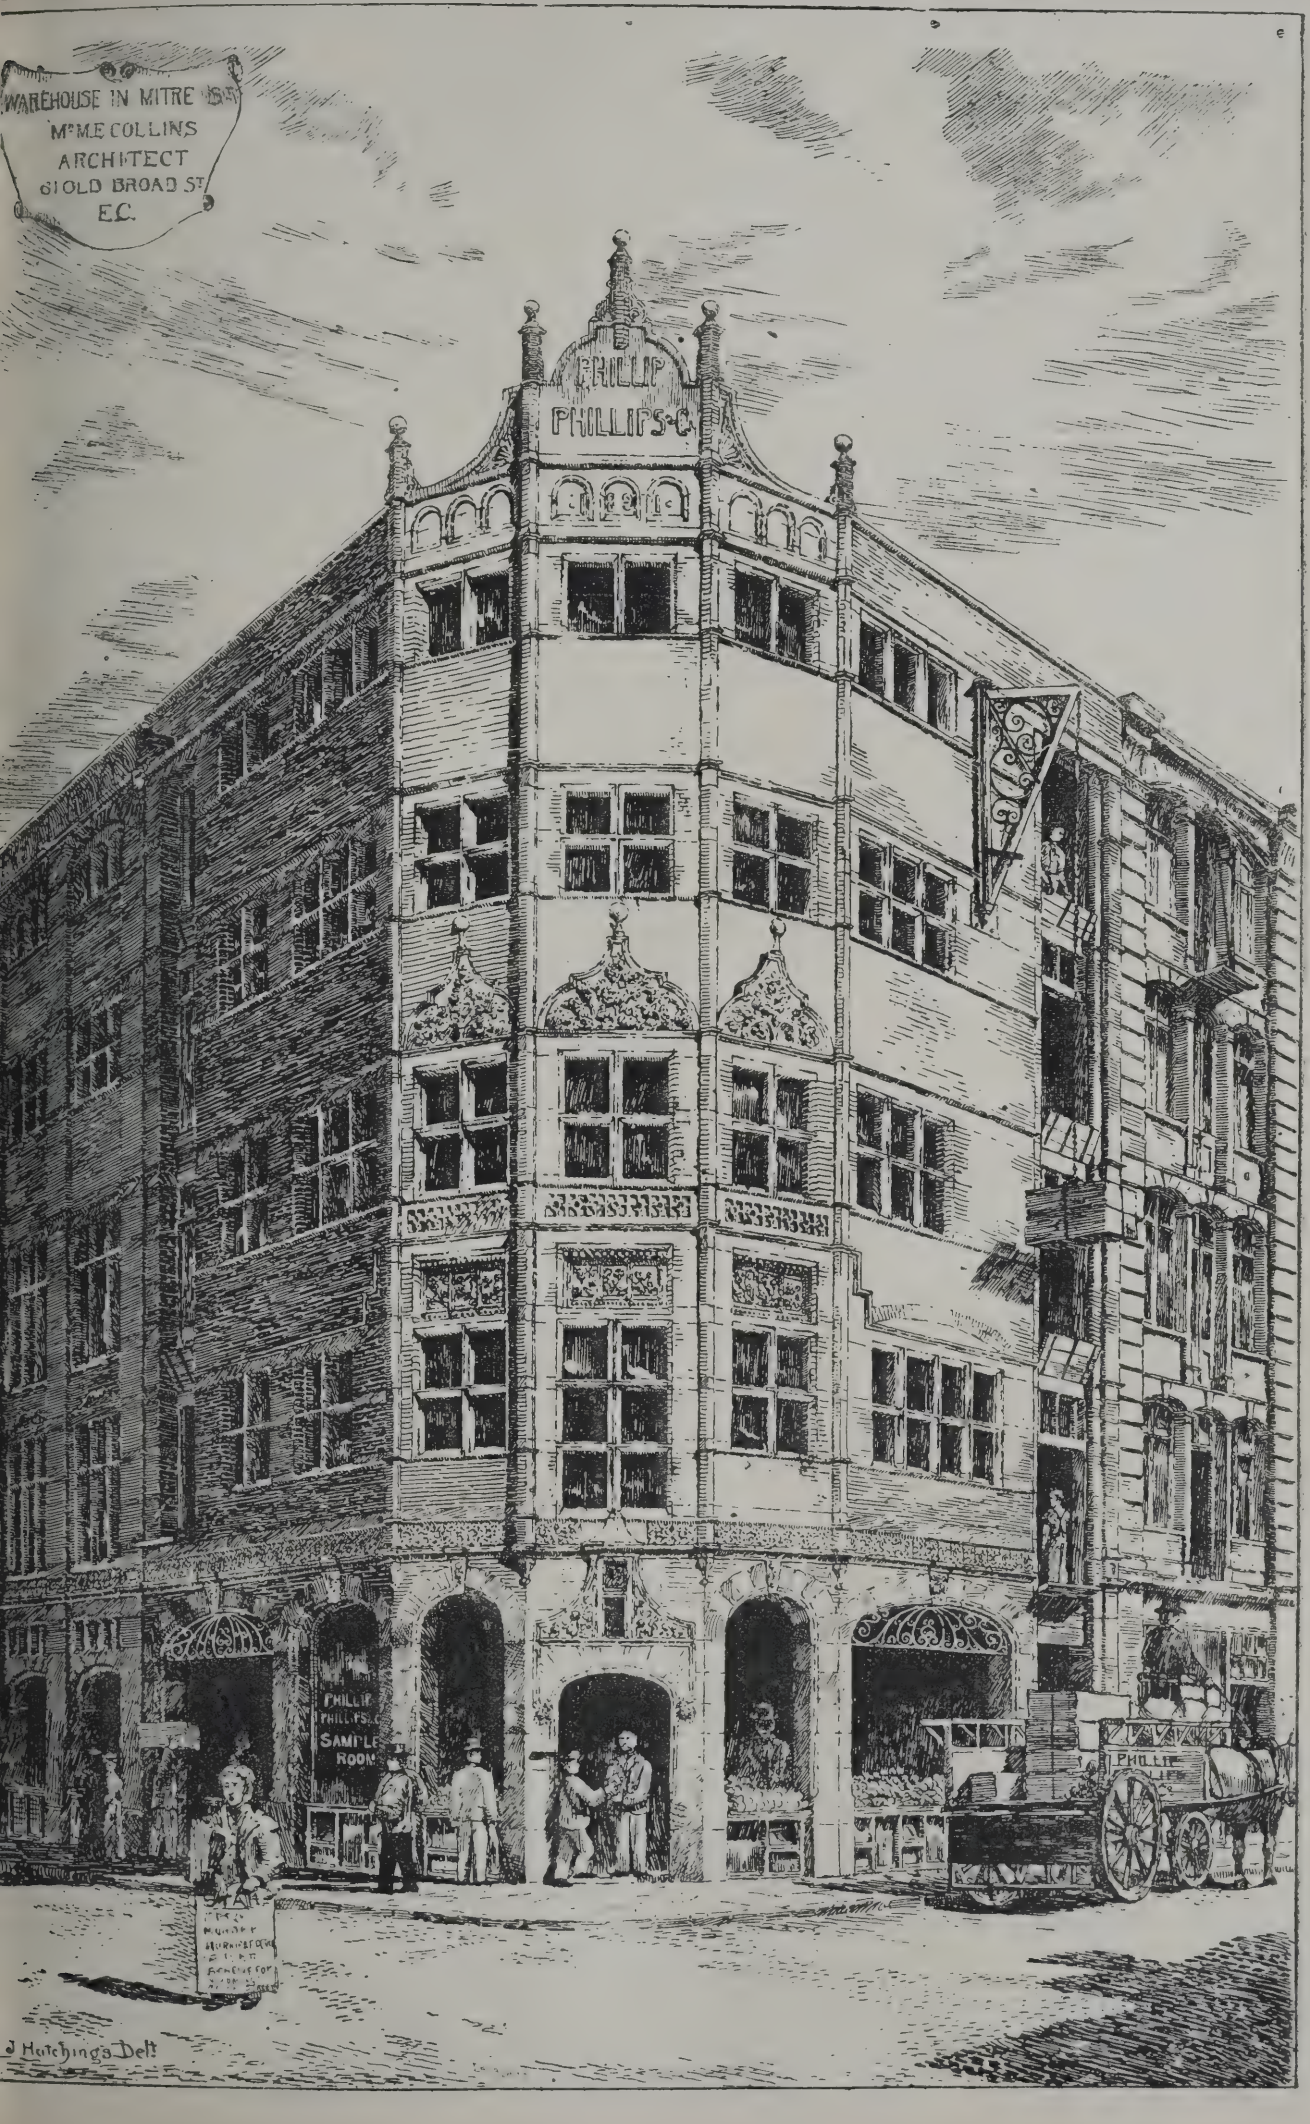
The town council of Stafford have decided instruct Mr. E. Pritchard, C.E., of Birmingham advise them and prepare a report as to a gen sewerage scheme for the district.

The city council of Bristol, on Tuesday, adop a report by a committee recommending that accordance with the private Act procured last sion they had instructed Mr. Francis Fox, C.E. prepare a plan for the erection of a fixed bridg substitution for the drawbridge, and for cover over the stream between the stone bridge and drawbridge. They now submitted Mr. Fox's for the works, the estimated cost being £8,065 the new bridge, and £15,493 for covering in river.

A new board school on the Coppice at Oldh to be known as the Wernett School, is in co of erection from plans by Mr. G. E. T. Lawren of London. It is to be one story in height and the central-hall principle, having classrooms op ing out of an assembly room; 1,010 school pl are provided, and the cost will be £13,500.

New designs are being prepared by Mes Burlison and Grylls, of London, for the prop memorial window in the De Trafford Chapel Manchester Cathedral, to the late Dean Oak When these designs are completed and approved work will be proceeded with at once.

The Chinese, an exchange paper informs employ an admirable putty, which they call sch liao, and which serves also as a strong cem suitable for uniting gypsum, marble, porcelain stone. The schio-liao is made by mixing thorou fifty-four parts, by weight, of pulverised sla lime, six parts powdered alum, and forty p fresh blood, until they form a paste. When n thinner, the same mixture can be used as a wa proof paint, and is much employed by the Chi for painting their houses, and for coating the in of barrels in which oil is to be transported.



On Saturday afternoon Lord Derby unveiled statue of John Bright, which has been erecte Albert-square, Manchester. The commission been executed by Mr. A. Bruce Joy, a pup Foley. The statue, which, like that at Birm ham, is in Sicilian marble, represents Mr. Brig the age of about sixty. The figure is 10ft. 6in height, and stands upon a pedestal of grey gra 12ft. high. The pedestal bears the simple appropriate inscription—"John Bright, 1811—1 'Be just and fear not.'" The statue is ere between that of Bishop Fraser and the Al Monument.

The death is announced of Mr. C. S. Wilkin of Sydney, the government geologist for New S Wales. Born in Northamptonshire eight-and-f years since, he entered the service of the geolog survey for the colony in 1852, and had held surveyorship since 1874.

The dock commissioners of Leith decided, Friday, to construct a dry dock, 285ft. by 7 immediately to the north of the Prince of W dry dock, the estimated cost being £25,000. It referred to the works committee to prepare submit plans.

WAYSIDE NOTES.

HE vestry of St. Saviour, Southwark, is about to undertake an extensive work. e few nights ago the vestry considered a rt from a special committee in favour of steps g taken for securing the erection of a new n-hall, the adoption of the Free Libraries and the Baths and Washhouses Act. A in Lavington-street has been selected, and estimated cost of buildings for the three itutions placed at £60,000. The report was pted by the vestry, and it therefore seems able that we shall shortly have an announce- t that the commissioners are prepared to receive ls, &c., as usual. The situation of the parish t. Saviour is such as should conduce to the ess of the library and the baths and washhouses. large number of poor people resident in the hbourhood will insure good annual reports the baths and washhouses, and the library reading rooms will be largely patronised by a al grade or two above the lowest, of which the sh has also a large proportion. The vestry fortunate in the matter of site. More than parish in London has adopted the hs and Washhouses Act, only to find impossible to procure the ground upon ch to erect the necessary buildings. The petition, if competition there be, will be ood one, and an interesting one, if there be intention to make one building of the three itutions. More probably the vestry, or its missioners, will have three distinct buildings, at Bermondsey, where we find town-hall, ls and washhouses, and free library, all in a —the latter, I noticed recently, now approach- completion.

---

am glad that someone has at last spoken *in re* Glenburn Hydropathic Establishment Com- tion. As nothing was forthcoming from rieved competitors, we shall conclude that the agraph in the Glasgow evening paper did not rectly describe the facts of the case. The ir was mysterious altogether, and if Mr. tson could give us the history of the com- tion, and the actual occurrences, we should glad that everything had been cleared up. It ms pretty clear that the invited competitors— whose ill-treatment we heard through the agraph in question—had only imaginary vances, or they would have raised their voice ore now.

---

he member for the borough of Paisley has just en the sum of £4,000 for the purchase of und, to keep open the view of the Paisley vn Hall. This is a true index of the way crowd together nowadays. Even buildings er from want of elbow-room. Mr. Dunn's ard for architectural effect is worthy of our em. Nevertheless, even as an architect, we that the £4,000 might have served much re practical ends, and been of more benefit to manity than in the shape of open lands for the e of a view of a building.

---

t seems probable that Birmingham will go to -Wales for its water, as before pointed out. town council considered a report from the er committee at its Tuesday's meeting, which ort was unanimously adopted. Sir Thomas rtineau, who submitted the report to the ncil, stated that the estimate for works suffi- t to deliver twenty-six millions of gallons y, including the maintenance of existing ks for ten years, was £3,621,000, and three itional instalments to meet the probable ease in population, would bring the total to rly six millions. Seeing that in the year 0 the scheme will prove remunerative, and t the present supply of water to Birmingham only calculated to last till 1920, the town ncil would appear to have decided wisely. proposed sources of the new supply are rivers Elan and Claerwen. If the reader consult the map, he will see that the mingham people, if the present scheme is ried out, are going to do something in the of water supply that should stir up Londoners possess themselves of a soul a little above nking Thames and Lea waters. Despite the arkable statement of Mr. Beachcroft, L.C.C., Tuesday's council, that "there was no water he world so wholesome, so pure, and so good hat which was taken from the Thames," the remains that we turn our sewage into the r and drink of the same waters. A comforting ection, truly!

London water is just now the topic of the day. Let us make the most of the attention for the moment directed to the subject; for it may be taken as a certainty that for weal or woe something will shortly be attempted either in the way of buying-up the old companies on Sir Thomas Farrer's principle, or in providing a new supply. Let us grasp the importance of the subject. We are ourselves, physiologists and chemists say, for the most part formed of water. Drinks of every kind are little else but pure water with, so far as bulk is concerned, insignificant added ingredients; victuals anything more toothsome than dry toast have water as a more or less extensive component part. Realising even these facts, and ignoring the other innumerable uses for which pure water is required, we should see the importance of this question of water supply, and be prepared to advocate only such schemes for its advancement as shall be real improvements, and not merely semi-political movements, such as I make bold to say is the present endeavour of the London County Council; for what good is to come of the purchase of existing companies? It will not provide new supplies, it will not purify existing sources, and it will not cheapen water. Unless the scheme for purchase includes and goes hand-in hand with clearly-conceived improvment I fail to see its advantages. The true solution of the question of London water will be found to be inseparable from a vastly-increased supply. More—much more—water is required, and from a pure source. Then water will be cheap; it will be uncontaminated; it will be used without stint by the poor. Stimulus will be given to the building of public baths when these institutions, at present paying large sums annually for the water they use, obtain water at a nominal rate. We shall then, too, have water to "play with," as Kingsley said years ago in a magazine article. It will gush out joyously in fountains, where now it is jealously guarded in pipes, and sold like milk or beer at per gallon. But we do not want fountains of clarified sewage water. We shall not be content with any mere enlargement of present supplies. Our future water supply must be absolutely pure—a crystal river flowing from some irreproachable fountain-head.

Respecting the proposed Egyptian irrigations, I read that the appointed keeper of old Philæ located himself in a chamber in the temple, and through lighting fires therein has cracked stones and let in the roof! The building might as well be drowned out by the irrigation works, as slowly destroyed by fire by its "keeper." Touching vandalism on the banks of the Nile, I also read that a party of tourists have done irreparable damage in one old building—the Great Pyramid, if I mistake not—by letting off Bengal lights! Further, a Russian youth with more money than veneration for antiquity has been smoking the cartoon-paintings on the walls of old temples with tallow-candles, especially delighting in defacing the heads! Furthermore—to cross the Mediterranean—we are told that the "guardians" of the Athenian Acropolis have been lately dismissed for damaging the monuments committed to their charge, and selling the fragments to visitors.

I hear that a movement is on foot to pull down the old lych-gate of Bexley Church, Kent, and to put up a new gate of a new design. This will be a piece of vandalism. As an old resident at Bexley, I know well enough that the proposed innovation is not only wholly uncalled for, but that the placing of a pretentious modern gate in lieu of the old one will destroy the general harmony. An elaborate lych-gate is, to my way of thinking, a questionable taste, and I can imagine the discordant effect of a new well-oiled, sleek, much-becarved oaken gate against the background of the plain, unpretentious church with its unassuming flint walls, and that quaint old extinguisher-like spire of silvery oak shingles for which Bexley Church is, or should be, justly famous. I understand that those who compass the destruction of the old lych-gate urge that it is too low. It is strange that the fathers of old Bexley did not find this out before, seeing that the gate has been in its present position time out of mind. I trust that Bexley is not becoming a stiffed-necked generation. A slight genuflexion or bending of the head might get over the difficulty, and be at the worst a gentle reminder of the desirability of humility and meekness. As to the proposal to remove the old lych-gate, I trust that the vicar and churchwardens will think twice before so doing, for it is neither necessary to the glory of God nor the comfort and convenience of man. GOTH.

CHIPS.

The Duc d'Aumale has promised to present to the Condé Museum, a set of forty miniatures, painted by Jean Fouquet, for the "Horæ" of Etienne Chevalier, which the Duke recently purchased for £12,000.

A committee has been formed at Wimbledon for the purpose of taking steps to raise funds for a memorial of the late Sir Joseph Bazalgette, the engineer of the Metropolitan main drainage, and of the Thames Embankment.

The tender of Mr. Macfarlane has been accepted at £27,476 for the erection of baths and washhouses in Hornsey-road for the vestry of Islington. The architect is Mr. A. H. Tiltman, of Torrington-square, whose design was selected in competition in June last, Mr. Charles Barry being the referee.

The parochial hall and Sunday-schools adjoining St. Leonard's Church, Bootle, erected at a cost of £3,000, were opened on Friday by the Bishop of Sodor and Man. The buildings are from the designs of Mr. George Bradbury, diocesan surveyor. The sole contractor for the work has been Mr. James Holme, of Seaforth, and the clerk of works was Mr. J. Speakman.

The congress of the Bristol and Gloucestershire Archæological Society was held at Gloucester on Thursday in last week, and after the business meeting the members visited the cathedral, where they were received by Dean Spence, who suggested that a meeting should be arranged next year to endeavour to elucidate the period of erection of the Early parts of the cathedral—the crypt and eastern end. Professor Freeman suggested one date and the late Gambier Parry and the Rev. W. Bazeley another, seventy years separating these conjectures.

Three stained-glass windows have been placed in the parish church of Frimley, Surrey. The one on the north side represents David and Solomon, those on the south side respectively have as subjects Ezekiel and Jeremiah and Joshua and Samuel. The work has been carried out by Messrs. Powell and Sons, Whitefriars Glass Works.

The Dean and Chapter of Canterbury will accept the bequest of the late Dr. Beaney, Melbourne, of £1,000 for repairs to the cathedral, the condition being that they permit the erection in the nave of a memorial of the testator.

On Rosary Sunday another stained-glass window was unveiled at the west end of the R.C. Church of the Sacred Heart at Holloway. The subject is the fifteen mysteries of the Rosary. The design for the window was from the studio of Mr. T. Grew, who also filled four windows in the south aisle and three over the high altar in the same church with stained glass.

The foundation-stone was laid last week of a church in West Fen, near March, dedicated to St. Mary Magdalene. The architect of the church is Mr. Walter L. Spiers, of London; and the builders Messrs. Porter and Sons, of Southery. The cost will be about £1,400.

A special meeting of the Police Commission of Dunfermline was recently held to consider a report of Messrs. Leslie and Reid, Edinburgh, upon the drainage system of the city. The engineers consider that it is necessary to have two separate systems, keeping one set of pipes entirely for storm water, and the other set of pipes for sewage, and they propose that the present sewage pipes should be used as far as possible for storm water, and new pipes provided for sewage. The cost of the scheme is estimated at £14,000. The report was discussed at great length, but a decision was postponed.

The late Mark Hopkins, a New York millionaire, earned vast wealth, for which his gardener's son is now at legal strife with his wife's second husband. Mr. Edward F. Searles, the second husband, is in possession. He was a decorative artist in a New York furnishing house, and ingratiated himself with the widow, who had a taste for house-building, which she was enabled to indulge by her enormous income, and gratify any whim, even to the construction of a fairy palace.

The Victoria Hotel in Lichfield-street, Wolverhampton, opposite to the entrance to the London and North-Western Railway drive, was formally opened on Wednesday week. The vestibule and hall are decorated with stained glass, and on the ground floor there have been provided coffee-room, bar, commercial room, smoke-room, billiard-room, and manager's and other apartments; while on the first floor are a number of splendidly-furnished suites of sitting and bedrooms, with large assembly-room; and on the floors above are about sixty bedrooms.

AN AMERICAN CHIMNEY.

AN instructive paper, read by Mr. John T. Henthorn, M.Am.C.E., before the American Society of Civil Engineers, and given in the *Transactions*, furnishes some particulars of the recently built chimney for the Narragansett Electric Lighting Company, Providence, R.I., designed by Remington and Henthorn. The shaft forms part of a large central station. The foundation for the structure, which is 260ft. in height, consists of piling and concrete. A space of 44ft. square was excavated 5ft. 6in. below high-water, and the sides protected by sheet piling, 16ft. long. Spruce piles, 50ft. long, were driven, spaced 30in. from centre to centre. These were sawn off level 5ft. below, and a bed of concrete, 6ft. 9in. deep, was laid, which rested on the soil 6in. below the heads of piles, as well as on the latter, composed of 1 part of Norton's hydraulic cement, 2 parts of sand, and 3 parts of coarse gravel and broken stone. Upon this mass the footings were laid, 36ft. square, to a height of 3ft. 2in., and from this the base of the chimney, 28ft. 6in. square, was commenced. The chimney was preserved vertical by a fixed centre mark, from which all measurements and plumbing were taken, and at each 20ft. of height the centre of axis was re-established. The base consists of three walls, an outer wall 28in. thick, an intermediate octagonal wall 12in. thick, and a circular core wall 16in. thick. The outer and intermediate walls are connected by pilasters 12in. thick, forming a kind of tie. The core-wall, 16in. thick, which gives 14ft. diameter of flue, is carried plumb above the top of last set-off to 78ft. high, after which it is reduced from 16in. to 12in. in thickness, after which it is carried up to 193ft., and is then again reduced to 8in., and is thus carried up to 219ft. 9in. This core-wall was executed in lime-mortar, slaked from three to six months before using. The outer wall of rectangular section is carried up 28ft., where at each of the corners cut granite blocks convert the square to the octagon, which it then retains throughout the rest of the height. The outer wall, with the intermediate wall and pilasters, up to 38ft., are laid with cement mortar one to two, except the outside course of outer wall, which is laid in soapstone-finish mortar of a dark-red colour. From this level to the commencement of the head, 223ft., the outer wall is laid with mortar consisting of two parts of lime and one of cement. The angles of the octagon shaft are executed in moulded brick and project as slight quoins. The head of chimney shows a series of plain set-offs, or projections, covered by a cast-iron cap. This was in 25 pieces, and bolted together. The inner-core wall is finished at top also by a cast-iron cap. The details and sections of the upper part show a brick opening or space for iron ladder, with a hinged flap of iron in the splay of capping next the centre outlet. The shaft has a batter, and at 83ft. in height the outer and intermediate walls unite, and form one wall. In the construction there were laid edgewise at each 20ft. in height, wrought-iron tie-bars, 4in. by ½in., with their ends bolted together, forming an octagon girdle. Other details are given in Mr. Henthorn's paper. It may be mentioned that the chimney was built from the inside platform, without any outside staging. Within the 14ft. chimney flue an elevator was fitted, and all the materials were hoisted by it. As an example of tall chimney construction, there is much that is worth notice; the projecting angle quoins, the bold brickwork head, and the arrangement of core are points deserving of attention.

ARCHITECTS' REGISTRATION IN VICTORIA.

AN adjourned meeting of architects who were not members of either the Victorian Institute or the Architectural and Engineering Association, was held at the Institute rooms in Melbourne on August 31st, to finally consider the amended draft Bill for the registration of practitioners in architecture. We reported in our issue of the 2nd inst. (p. 460) the previous meeting convened for the same purpose. At the adjourned conference, Mr. G. C. Inskip took the chair, and called on Mr. A. W. Craven, M.L.A., to read the report of the five gentlemen appointed at the previous meeting to examine the Bill clause by clause. This showed that all the suggestions made at the last meeting had been carefully considered. The principal amendment made consisted in the clause relating to engineers. Whilst the committee had been careful not to interfere with an engineer carrying out all works connected with engineering, they had endeavoured to prevent his encroaching upon the work of an architect.

After some discussion, the report was unanimously adopted, and the names of the five architects who had prepared it—Messrs. Craven, De Geris, A. E. Duguid, J. Little, and Marsden—were formally added to the committee having charge of the conduct of the Bill through the Victorian Parliament. The draft, as amended, is supported by the prominent professional journals of the colony, including the *Australasian Builder and Contractor's News*, which remarks, in a leading article on the Bill:—

"The rapid progress lately made with the Victorian Registration of Architects' Bill must be very gratifying to all who, like ourselves, are strong advocates of the principle of architectural registration. The representatives appointed by the various sections of the Melbourne profession so nearly coincided with each other as to the various clauses of the Bill, that they were able at one sitting to give it the final touches of revision, and it will be seen from the report which appears in another column, that the 'outside' practitioners have confirmed the few alterations which their representatives had agreed to. The skeleton Bill will now be handed to the Parliamentary draftsman, in order that it may be amplified and otherwise rendered suitable for presentation to Parliament; but, seeing that the current session is so far spent, and that the Assembly is so blocked with other business, we should perhaps be too sanguine to expect the Bill to be fairly launched upon the Parliamentary waters until next year."

The *Building and Engineering Journal of Australia*, the organ of the Victorian Institute, says:—

"The new Council of the Royal Victorian Institute of Architects is to be congratulated heartily upon the broader view it is taking of things architectural, and the largely attended meeting held on Thursday, the 13th inst., is undoubtedly a healthy sign. It must have been patent to all who attended the meeting that had it been called earlier much heart-burning would have been prevented, and the Bill for the Registration of Practitioners in Architecture would have been at the present time far nearer being an accomplished fact. The meeting may be said to have been unanimous on the vote taken as to the general principles of the Bill, only one hand being held up in dissent. The draft outline, since we published it on the 20th of September of last year, has been materially altered, and is now a thoroughly broad and liberal measure, and as it stands at present will have our hearty support, and, we have no doubt, that of every qualified practitioner in Victoria. At the same time we are thoroughly in accord with the remarks made at the meeting by Mr. A. E. Duguid, who echoed in perhaps somewhat different words the opinions expressed by us upon several occasions. We support *this* Bill, not that we have in any way altered our views as regards its necessity, but as it now stands we consider that with one exception, and this, we think, rather an important one, it will do no harm, even if it do no good. Our view of this exception may, however, be a mistaken one, and we allude to the almost inevitable annihilation of the Royal Victorian Institute of Architects, for its power for good will, we fear, cease as soon as the Registration Bill becomes an accomplished fact, and the lever, instead of being worked by the Institute, as at present, will be worked by the General Council of Architectural Education, and as this will be by its constitution a semi-governmental body, red tapeism and the attendant evils of all Government departments will be rampant, and the outcome will be the degeneration of the Royal Victorian Institute into a very second-rate club. . . . . The draft outline as altered we feel sure will commend itself to every member of the profession, whether of the Institute, Association, or outside practitioner, who feels that such a measure is for the benefit of the profession. We have our opinion upon this matter, as already stated, and consider that a real live institute, such as the Royal Victorian Institute is rapidly becoming, would entirely supersede the necessity for such a measure; but as a large majority of the profession appear to be in favour of it, we shall in future do our best to help them to gain it, from the conviction that if it does not fulfil the expectation of its advocates, it can at all events do no harm to the profession. We have now obtained what we have been throughout advocates of—a full discussion and a decided expression of opinion on this matter, and we again congratulate the Council of the Institute upon their action."

ORNAMENTAL WOODS.

MANY kinds of ornamental wood are now to be had suitable for joinery and cabinet-making. The principal thing is selection. For veneering or panels the root end is the most ornamental. Even mahogany varies; there is the plain Honduras kind used for ordinary purposes; the "watered," "mottled," "bird's-eye," and "festooned" varieties, depending upon the vein structure. The Mexican mahogany is less ornamental than the Cuba variety, which is wavy on its figure and takes a high polish, or the St. Domingo variety, also of deep colour, and well figured. These highly ornamental mahoganies are generally imported in very small logs 3ft. to 10ft. long, and seldom more than 8in. to 10in. square. Doors and other framing made of Honduras m the stiles and rails, and of Spanish in the pan are effective. Jarrah, or Australian mahoga is very similar in colour, hard and durable, wh a wavy grain, and promises to become a us substitute, though its importation is not v large. For roof timbers and framing, ja offers some advantages, but it is said to be li to shrinkage.

One of the many decorative woods for wh New South Wales is noted is the tulip-wo known as the Horpullia pendula. It has advantage of being close-grained, hard, and figured, the colours varying from black to yell For decorative joinery the tulip wood is in m esteem, especially for panels, cabinet wo and turnery. Blackwood, which resem American walnut, is a valuable ornamen wood, tough in fibre and well figured, and tainly a desirable substitute for mahogany in more figured varieties. It is easily bent steaming. For joinery, blackwood is exce ingly well suited, though somewhat costly. point should be remembered in selecting wood this class—namely, that the most beautiful figured specimens are to be found near the end, and for choice veneers the root stocks valued in the market. Notwithstanding this, butt end of the tree is often wasted.

THE DECORATIVE TREATMENT O NATURAL FOLIAGE.

A COURSE of Cantor lectures on this subj was delivered last spring at the Society f Arts by Mr. Hugh Stannus, F.R.I.B.A. In s introductory address, the lecturer dealt with e elements of decoration, showing that the cl f impelling motives causing the decorative tre ment of objects have been (*a*) the functional, t necessitated by the usage; (*b*) the æsthetic, t resulting from the instinct to please the e; and (*c*) the didactic motive, that arising fr the desire to record or to teach. The æsthe instinct of the early peoples was gratified by e forms of their weapons or tools, the patterns which they were decorated and the imitation f surrounding living objects, first of animals afterwards of vegetable forms. The selection f the elements of decoration were narrowed such things as were pleasing at first glance, further limited to such as were suitable in sha and size. According to their relative digni they might be classified as the human fo animal forms, natural foliage, artificial obje artificial foliage, and geometrical figures. Wh it was true that artificial foliage in Orie pattern-work was evolved from a much conv tionalised version of natural foliage, this was the case with Western architectural ornamentati The stock foliage of the ornamentist was evol in the West in connection with architecture, bu the East with textiles, and hence the prim elements of decoration were derived in the W from geometrical lines, such as the meander spiral, and in the East from natural flowers leaves—e.g., the pine and pomegranate. The method of treating these elements had been ferent. In the West the geometrical lines we enriched by the introduction of the details natural vegetation—thus gradually becom more naturalesque; but in the East the natu foliage was modified by the introduction geometrical arrangement, thus becoming m artificial. An approximation between the t treatments sometimes appeared, but the artifi and natural foliage were essentially differen design, and should be kept distinct in applicati Each of these two kinds of foliage had its o proper use. Artificial foliage was appropriate the enrichment of architecture; and natu foliage to those objects which were term "movables," including furniture, and m especially hangings and other applications of textile art. Architectural foliage was gover by severe rules of repetition, axiality, symmetry. Hence, artificial foliage, being regu in its structure, was more appropriate than (apparently) irregular growth of natural folia Natural foliage, on the other hand, exhibi an apparent playful freedom, the underly rules detected by the scientific botanist not be obvious to the casual observer. There had b attempts to introduce natural foliage into arc tecture, as, for example, in the Decora Gothic period, but the artificial elements had e proved too strong, and the two had never mix In architecture everything had three dimensio

hereas the close imitation of natural foliage ould be confined to objects of two dimensions i.e., to plane surfaces and figured materials. he lecturer explained that he did not propose to eat of "natural" foliage from the historical ndpoint, but merely as æsthetically applied. here were, broadly speaking, four methods of eating natural foliage—those at the art-pole of alism and conventionalism, and at the science- le of disguised artificialism and botanical alysis. The first two methods were artistic d legitimate; the others were inartistic and mis- ading. In the Botanical Analysis treatment of liage the student was taught to draw each ant with the stem straightened out, the leaves ttened out, and the flowers represented as in le-elevation or plan. The flowers were further lled in pieces, and the petals were flattened t; often, also, the stems and buds were cut rough and patterns were made with the ctions. Mr. Stannus condemned this method treating a scaffolding as if it were e building itself, sacrificing the variety appearance, the subtle curvature, and the reshortening of perspective to be observed in liage for the mere diagram created by its rmal rearrangement. This method was offici- ly encouraged by the Science and Art Depart- ent about twenty-five years ago, and Mr. F. dward Hulme's "Suggestions in Floral esign,"* and other books, showed it at its best. t that time Japanese work was not known, and ut for its revelations, the pattern-artist of to-day ight still be occupied in pinning leaves and owers against the wall. In a second method, uch practised in Germany, and which Mr. tannus termed the "Disguised Artificiality" reatment, the student was taught to sketch out hat he considered to be good curves and spirals, nd then either to bend a selected plant, so that s stem might coincide with them, regardless of s proper natural growth; or to deck out the pirals first drawn with the leaves and flowers of he selected plant. The first of these plans dis- egarded the fact that the branching out of a plant as as much part of its character and beauty as ere its flowers and leaves, and the second, hich was more often practised, was responsible or many of the laboured and uninteresting lesigns which were common. Indeed, if its reatment were universally followed, there would oon be an end to design with natural foliage. he quality of symmetry, which often under- ay these methods of treatment, was to e avoided whenever possible in natural oliage design. So injurious was the influence f symmetry in natural foliage design, that it night almost be a test question: Was the design ymmetrical? Balance of points, and not ymmetry, should be the aim of the designer. he mind soon tired of artificiality, both in urvature and symmetry, while the balanced lines f nature had a pleasant freshness and in- xhaustible variety. Passing on to consider ealism and conventionalism, Mr. Stannus showed hat the former, the attempt to render a re- roduction as like the reality as possible, had ever been the aim of the pictorial artist; while he latter, the effort to render much of the beauty of the original, with due regard to their capabilities, was the aim of the decorative artist. The approach from realism to conventionalism was made by a reduction in the number of points which were realistically treated; and also by a reduction in the degree of realism of colour, gradation, or shading, through all parts of the design.

The County Surveyor for Kent, Mr. Ruck, is not satisfied with the proposed increase of his salary by £200 which the Bridges and Roads Committee of the Kent County Council recommend, and has addressed a circular to the members, in which he asks that the sum may be made retrospective, and also that an annual sum of £50 towards the keep of a horse and trap may be granted him.

The general committee appointed for the restoration and permanent preservation of the monument at Wellington, Somerset, have decided that the repair of the obelisk shall be commenced at the earliest possible time next year, and that in the mean time any practicable work to prevent further dilapidation be carried out by the local committee. The amount required to carry out the proposed scheme in its entirety is about £1,200. Of this amount, £302 6s. 6d. has been promised and paid, while the lowest tender for simply repairing the present dilapidation is £468.

Building Intelligence.

CAMBRIDGE.—A new chapel for Queens' College was dedicated on Tuesday by the Bishop of Ely. It is erected on the north side of Walnut Tree-court, and stands parallel to the old chapel, which was built in the reign of Henry VI. The style of the new chapel is Perpendicular, and the fancy materials are thin bricks with Ancaster stone dressings for external work, and clunch for the interior. The external length is 107ft. and the width 34ft. The lofty east gable is a prominent feature of Queen's-lane with its large window of seven lights erected in memory of Dr. William Wright, Professor of Arabic. The sides of the chapel have traceried and mullioned windows of three lights, one in each bay. The whole effect aimed at is one of dignity of proportion rather than of any profusion of ornament, which is, indeed, used sparingly. Internally the chapel has a panelled and painted roof, the eastern part being enriched with gold and colour. The chapel is furnished with a rich screen of carved oak erected in memory of the nine members of the Poley family who were members of the college. The stalls are also of oak surmounted by an overhanging cove forming a continuous canopy. The reredos is of carved wood work, and has three pictures, scenes from the life of Our Lord worked up into it. This old altar-piece on three panels represents the Betrayal, the Resurrection, and Our Saviour's appearance to the Apostles after His Resurrection. It has been for years in the President's lodge, and is supposed to be the work of Martin Schoen; it formerly was in the chapel.

LONDON.—On Thursday, Oct. 8, the nave and aisles of St. Paul's Church, Harringay, N., were consecrated. The style is 13th-century Gothic, with nave arcade and clerestory, and lean-to aisles, built with red Bracknell bricks (facing internally as well as externally), Bath-stone arcades, strings, windows, and door dressings. The nave roof is of red fir, framed with curved and moulded principals, springing from stone caps and shafts, boarded inside to an arched shape, having no cross-ties visible; externally it is covered with Eureka grey slating. The nave is 97ft. 6in. long, and 29ft. 9in. wide; the total width of nave and aisles being 62ft. 3in.; the height to nave wall plate from floor is 37ft., and to apex of roof vault 52ft., and to ridge, 65ft. When the chancel is built, the total length of nave and chancel will be 130ft. The seats are of oak, and the altar is of cedar wood. The architect is Mr. G. M. Silley, of 17, Craven-street, Strand, W.C., and the builders are Messrs. Treasure and Son, of Shrewsbury and Noel-park, N.

LONDON COUNTY COUNCIL.—The members discussed on Tuesday the recommendations of a committee in respect to the water supply of the metropolis. Those recommendations were to the effect that the Council should not accept the decision of the Select Committee of the House of Commons, namely, that purchase of the existing undertakings should precede the establishment of an independent supply; that it would be desirable to acquire the undertakings of the existing companies if they could be obtained on reasonable terms; that the price to be given for them should depend on their true value, having regard to their ability to supply future wants; and that before any terms of purchase could be considered, the liabilities to capital expenditure for new or supplementary sources of supply in the immediate future should be authoritatively ascertained. The Council, by large majorities, eventually adopted all the recommendations. The Main Drainage Committee brought up a lengthy report on the subject of the pollution of the river Thames. It was decided, on the recommendation, that two additional sludge ships, of a type similar to the steamship *Bazalgette*, be obtained; and that, for the purpose of introducing the system of continuous treatment of the sewage at the Crossness outfall, the necessary weir walls be erected, and that this work be executed under Mr. Webster's contract for the precipitation works.

ST. ALBAN'S.—The work of refilling with statues the screen of the high altar of St. Alban's Cathedral, which has been in progress for nearly eight years, has just been completed. Messrs. Harry Hems and Sons, of Exeter, have carried it out for Mr. H. H. Gibbs, M.P., Sir A. W. Blomfield acting as consulting architect. The figure of our Lord in Majesty and those of the Twelve Apostles are of white alabaster, and the other 65 statuettes in niches are sculptured in yellow magnesia stone from Mansfield Woodhouse. Thirty-three of the figures are life-size, the others being smaller. An important section of the work is the treatment of the plain space that went to form the central cross, and for which—to designs made by Sir A. Blomfield—Mr. Gibbs obtained a faculty unopposed last year. It consists of erecting a plain cross, a *tilli* with letters I. N. R. I. on it, and a foot rest at the base of the cross all in yellow Mansfield stone. This is supported by a plain column of clunch stone, and over the head of the cross, and beneath a projecting canopy, a crown of glory; whilst at the ends of the arms of the cross are ministering angels, also in clunch stone, with wings extended, and having chalices in their hands. Illustrations from photographs of some of the statues will be found in our issues of Nov. 19, 1886, and June 28, 1889.

SHEFFIELD.—The Mayor of Sheffield laid on Thursday in last week the foundation stone of the new Municipal Buildings. They are being erected from the designs of Mr. E. W. Mountford, of Buckingham-street, Strand, which were selected in competition fifteen months since, and were illustrated in the BUILDING NEWS for June 27, 1890. The contractor is Mr. Edmund Gabbutt, of Liverpool, his tender being £83,945, exclusive of furnishing. The land cost £49,000. The style is Modern Renaissance, and English in character and detail. Great ornamentation has been avoided. What carving there is is in low relief, and confined almost entirely to the Pinstone-street front, while all the ornamentation is concentrated in masses. The tower at the corner of Pinstone and Surrey streets is 25ft. square externally, and will rise to a height of 175ft. The height of the Pinstone-street elevation has been raised 5ft. from design as selected. The first floor contains the Mayor's apartments and the rooms for the Town Clerk, and is approached by four staircases, one from each entrance. The three state rooms measure together 157ft. by 35ft., exclusive of bays, with a clear height of 23ft. These can all be thrown into one hall when required. A corridor, 11ft. wide, communicates with all these rooms. An open gallery, entered from the Mayor's reception room, is provided over the principal entrance. The council chamber, approached directly from the grand staircase, and occupying the centre of the site, is 64ft. by 39ft., and 30ft. in height. There are various committee and sub-committee rooms, which are placed in one corridor, close to the Town Clerk and council chamber. The Town Clerk's department is close to the council chamber and committee rooms. On the ground floor are the grand staircase and hall, the latter being 44ft. by 40ft., and 45ft. high. The Borough Accountant's department on the left. The Borough Surveyor's department is placed between the Surrey and Norfolk entrances. On the lower ground floor will be the Health Offices and Weights and Measures Offices. The second floor will contain the Sewerage and Rivers Offices. Since the acceptance of Mr. Mountford's design many minor alterations have been made. The walls are to be faced with stone from Mr. Turner's quarry at Stoke Hall, which has been tested in the Cutlers' Hall. Internally the stone used will be Coxbench. The walls of the central hall and grand staircase will be lined with polished Hopton Wood stone round the lower part, the upper part of the walls being of red and yellow Mansfield stone. The stairs themselves will be of Sicilian marble, and the balustrade of alabaster. The corridors generally will be lined with glazed tiles to a height of 5ft. from the floor. The floors throughout will be formed of concrete carried upon joists of British steel. The heating is to be carried out by Messrs. Longden and Co., of Sheffield. All the windows will be fitted with wrought-iron casements made by Messrs. Burt and Potts. The tower is to be surmounted by a bronze figure of Vulcan, 7ft. in height. The principal entrance has been considerably altered since the competition. Mr. J. R. Scales is the clerk of the works.

Mr. F. H. Henshaw, the well-known landscape artist, died on Sunday night at his residence, Green-lane, Small-heath, Birmingham, at the advanced age of 84. For over half a century he was a constant comtributor of landscape work to most of the principal exhibitions.

Engineering Notes.

The New Railway to London.—The Bill promoted by the Manchester, Sheffield, and Lincolnshire Railway Company to authorise the extension of their system to London will be again brought before Parliament in the coming session. In the main, the measure will be very much what it was when so unexpectedly rejected by the House of Commons Committee; but it has undergone important modifications in detail, and meets the objections raised against the scheme last session. These modifications chiefly affect the question of the proposed London terminus, the plans for which have been considerably altered and extended. Some deviations from the route originally laid down between Beighton Junction and Quainton-road are also provided for to meet the requirements of local authorities and landowners. Besides the St. John's Wood land—to the disturbance of which such strong objection was offered by artists and others resident in the locality—it is now sought to acquire the ground bounded by Grove-road, the north side of Church-street, Edgware-road, and St. John's Wood-road, and also an area extending from St. John's Wood-road to Marylebone-road at the corner of Allsopp-place.

Torquay.—A special meeting of the Torquay local board has been held for the purpose of receiving the report prepared by a committee appointed some time since to visit various watering-places in the country, and make inquiries respecting promenade piers. The report stated that the committee had visited Plymouth, Great Yarmouth, Lowestoft, Hastings, St. Leonard's, Eastbourne, Bournemouth, Brighton, and Scarborough, and inspected the promenade piers and their construction. All the piers were exposed to rougher weather than a similar structure would be in connection with the concrete groyne now in progress in Torquay. The committee had reasonable grounds for assuming that a promenade would yield, in connection with the new harbour works, a very fair income. They recommend that a pier be erected in connection with the present groyne—that such pier be constructed of iron screw piles and wood decking, so as to give an approach for a distance of 736ft., or thereabouts, 30ft. wide, and a height of not less than 9ft. above high water, the widened portion being placed on the Tor Abbey side of the structure; that the width of the angle, and for a distance of about 214ft., be similarly constructed not less than 100ft. for the purpose of enabling a suitable pavilion, at least 70ft. wide, with sheltered seats, to be erected thereon; that the outer length of the groyne to the end thereof be similarly widened out and at the same level to a width of 50ft., and provision made for the erection of a band-stand and shelters, and that landing-places be provided. The whole might be carried out for a total estimated outlay of £30,000, and the committee recommended steps being taken to apply to the Board of Trade for a provisional order to carry out the work. If thought fit, the scheme could be made a progressive one, and the work carried out in four sections, the respective cost of which would be £7,000, £7,000, £8,000, and £6,000. The surveyor presented plans, and explained the details of the proposed work. After some conversation, it was decided that the matter should be thoroughly discussed in committee, and brought before the ratepayers at a later period.

Alterations have been made to the vestry-hall and offices, Islington, embracing the ventilation, which is now carried out on the Boyle system, the extraction of the vitiated air being effected by the latest improved form of the self-acting air-pump ventilator.

On Sunday morning, the anniversary of the erection of the cathedral nave at Bristol, the Archbishop, who occupied the pulpit in the cathedral of that city, preached with special reference to the consecration of a place of worship. He reminded the congregation that much, both internally and externally, remained to be done in the nave. Externally it was a matter of constant observation, especially to strangers, that it was still quite unworthy of the city; and internally all felt that the cathedral needed much rearrangement now that they had a nave. They had never been able to develop properly the uses of that nave, because the chancel was intended to serve as both nave and choir at the same time. He hoped and trusted that these things might ere long be remedied.

COMPETITIONS.

Cross Deaf and Dumb School, Blackburn.—At the last meeting of the general committee of the proposed Deaf and Dumb School for North and North-East Lancashire, a report was presented by the sub-committee appointed to consider the financial relations between the general committee and the architects. The report stated that the sub-committee thought it a moot point whether they had the power—even if it were desirable, which they did not admit—to act upon the clause in the "Instructions to Architects," enabling them to dispense with the services of the architects upon payment of £25. With the object of arriving at a satisfactory arrangement, they deputed Mr. Willan to approach the architects, and a conference was held at Blackburn. As a result, Messrs. Sames and Green agreed to waive all claims upon the committee on the conditions that they be paid £75 in part recognition and in full discharge of their services, and for expenses out of pocket, that they be retained as the architects for the school, and that their remuneration for the building be at the rate of 5 per cent. for plans, &c., and 2½ per cent. for quantities. The sub-committee recommended the acceptance of this offer, thinking £75 a moderate sum when it was remembered that £72 was for expenses actually incurred by them. Mr. Willan moved a resolution embodying this recommendation. He pointed out that the advantages of the course were obvious—the avoidance of probable litigation; the removal of all friction between the committee and the architects; no more loss to the funds of the institution than would have happened had the committee had the power to dispense with the services of the architects for having failed to prove the correctness of their estimate; the minority who had succeeded in checking the scheme would be only too happy to co-operate with the majority in formulating a new scheme best suited to the requirements of the case; and the restoring of public confidence in the wisdom and capacity of the committee to perform the work in hand. The resolution was passed unanimously.

Oswestry.—Oswestry seems likely, from all accounts, to afford evidence for the truth of the adage about "too many cooks spoiling the broth." Last year, it will be remembered, the authorities of the town held a competition for the design of new municipal buildings, and Mr. T. M. Lockwood, F.R.I.B.A., of Chester, acted as their professional referee. The chosen architect proved to be Mr. H. A. Cheers, of Twickenham, whose design we illustrated in the Building News for January 23rd this year. In due course the working plans were prepared, and the Corporation obtained tenders for the work, when it was found that the cost would exceed by some £2,000 the stipulated outlay. Modifications were made by the architect, who in the end was paid for his plans, and the Town Council became possessed of a set of drawings without an architect. Who better than the referee for the post?—and so it came about that Mr. Lockwood was proposed as the best man to see the designs realised. Subsequently, however, as we learn from the report of the last Oswestry Town Council meeting, the Mayor (Mr. Wynne Corrie) declared it agreed to unanimously that Mr. Bolton, their own surveyor, be instructed to "carry out the work according to Mr. Cheers's competition plans (as modified), under the supervision of Mr. Lockwood as consulting architect." It was explained to those who called this arrangement in question that a good clerk of the works would be engaged to help the surveyor. What a happy family!

Mr. J. B. Morgan, M.S.A., architect, Llanelly, has been instructed by the Swansea U.D. Board to prepare plans of a school to accommodate 439 children to be erected at Goneinon.

A mace, made by Messrs. T. and J. Bragg, of Birmingham, has been presented to the recently formed corporation of Tunbridge Wells. It is in silver-gilt, and is nearly 4ft. in length.

About 30ft. of the city wall surrounding the Rougemont Castle, Exeter, and close behind the site of the castle lodge, under which, on its removal, human remains were recently discovered, fell down on Friday. Some time since another portion of the wall gave way and fell on the roof of the lodge, and in Friday's fall nearly the whole of the new wall was carried down with the old. It is supposed that the excavations in connection with the pulling down of the lodge weakened the foundations of the wall.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

A.A. Lyric Club.—The fourth season of th successful club, which now numbers over 1 members, will be inaugurated by a smoki concert at the Mona Hotel, Covent Garden, Friday, 23rd inst., commencing at 7.30, when Mr. A. C. Bulmer Booth, the president the club, has arranged a capital programm Members of the A.A. desirous of joining t Lyric should communicate with Mr. T. Moore Mr. J. D. Scott, hon. secs.

The Glasgow and West of Scotland Technical College.—The class in architecture Saturday afternoon began a series of visits measure and sketch in Glasgow Cathedral, whi are to continue during the present month, und the direction of the lecturer, Mr. Charl Gourlay, A.R.I.B.A. The opening lecture w delivered on the previous Monday evening, t subject being "Scotch Ecclesiastical Archite ture." The lecture was illustrated by a lar number of photographs, photo-lithographs, a sketches. The various classes at the college f building construction were also reopened la week.

The Sheffield Society of Architects a Surveyors.—The Sheffield Society of Architec and Surveyors inaugurated their winter sessi on Monday evening, the 12th inst., by a convers zione and concert held in the drawing-room the Cutlers' Hall. The president (Mr. C. Innocent) delivered his address, which w followed by an excellent musical programme, a the company had also the privilege of inspectin an interesting collection of pictures, photograph etchings, and other objects. Messrs. Longde and Co. lent a good collection of wrought ir and brass work of German 16th-century date, a modern work designed by the late J. Sedding. The president, in his address, said th present was an age when everybody seemed be concerned about drainage and matters affec ing the health of the people. Architects ough above all men, to be so concerned, and they h every reason to see that in all these things th best that could be done was done. They oug to be ready to co-operate with all public bodi and officials charged with the duty of caring f the public health, and they had a right to expe that their efforts in this direction would be r ciprocated in a friendly spirit. Mr. Innoce went on to remark that perhaps the weake point in the society was the small number students connected with it. He advised t younger members of the profession to join it f their own sakes and for mutual self-improv ment, and suggested that a class for taking o quantities during the winter months, and f outside surveying in the summer, might well organised to supplement the teaching whi architectural pupils were in the habit receiving.

CHIPS.

The Wesley Centennial chapel in Dilston-roa Newcastle-on-Tyne, was dedicated on the 8th in The chapel is Gothic in style, and has been bu from designs by Mr. J. W. Taylor, of Newcast It seats 900 persons, and cost £5,500. Mr. G. Mauchlen was the contractor, and Mr. R. Yates t clerk of works.

Kilmarnock town council reached, on Friday, t conclusion of the prolonged negotiations wi regard to the purchase of the Water Company undertaking.

New police buildings are about to be erected Risca from plans by Mr. William Tanner, of New port, county surveyor of Monmouthshire. T contractor is Mr. John Linton, of Newport, a the outlay will be about £3,000.

The town council of West Ham are building public hall and offices at Canning-town, at a co of £17,500. The plans have been prepared by t borough surveyor, Mr. Lewis Angell, and the co tractors are Messrs. Allen and Sons, of Kilburn.

The Corporation of Mossley having applied to th Local Government Board for powers to borro money for the purchase of the Whitehall estat which they intend converting into a town hall a pleasure grounds, Mr. S. J. Smith, C.E., Goverr ment Inspector, held an inquiry into the matter Friday. The town clerk said the house a grounds cost, twenty years ago, £100,000, and no they were offered to the corporation for £4,00 They intended borrowing £2,338 for the purposes a town hall, and £2,162 for public pleasure ground The grounds comprised 36,340yds. of land, fr from chief rent.

TO CORRESPONDENTS.

e do not hold ourselves responsible for the opinions of ır correspondents. All communications should be rawn up as briefly as possible, as there are many aimants upon the space allotted to correspondents.]

; is particularly requested that all drawings and all imunications respecting illustrations or literary matter uld be addressed to the EDITOR of the BUILDING ws, 332, Strand, W.C., and not to members of the f by name. Delay is not unfrequently otherwise sed. All drawings and other communications are t at contributors' risks, and the Editor will not lertake to pay for, or be liable for, unsought contribu-ıs.

heques and Post-office Orders to be made payable to ? ASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

ne Pound per annum (post free) to any part of the ited Kingdom; for Canada, Nova Scotia, and the United tes, £1 6s. 0d. (or 6dols. 30c. gold). To France or gium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), 10s. 4d. To any of the Australian Colonies or New land, to the Cape, the West Indies, or Natal, £1 8s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements s. per line of Eight words, the first line counting as the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous l Trade Advertisements (except Situation advertisents) is 6d. per line of eight words (the first line unting as two), the minimum charge being 4s. 6d. for words. Special terms for series of more than six ertions can be ascertained on application to the Pub-her.

Front Page Advertisements 2s. per line, and Paragraph vertisements 1s. per line. No front page or paragraph vertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" "Situations Wanted" is ONE SHILLING for TWENTY-VE WORDS, and Sixpence for every eight words after. *Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the ice not later than 3 p.m. on Thursday. Front-page vertisements and alterations in serial advertisements ust reach the office by Tuesday Morning to secure inser-n.

NOTICE.

ound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., L., LI., LIII., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

F. GOVER. (We suppose so. It is no fault of ours that Mr. Leaning's series on Prices has not been completed long since.)

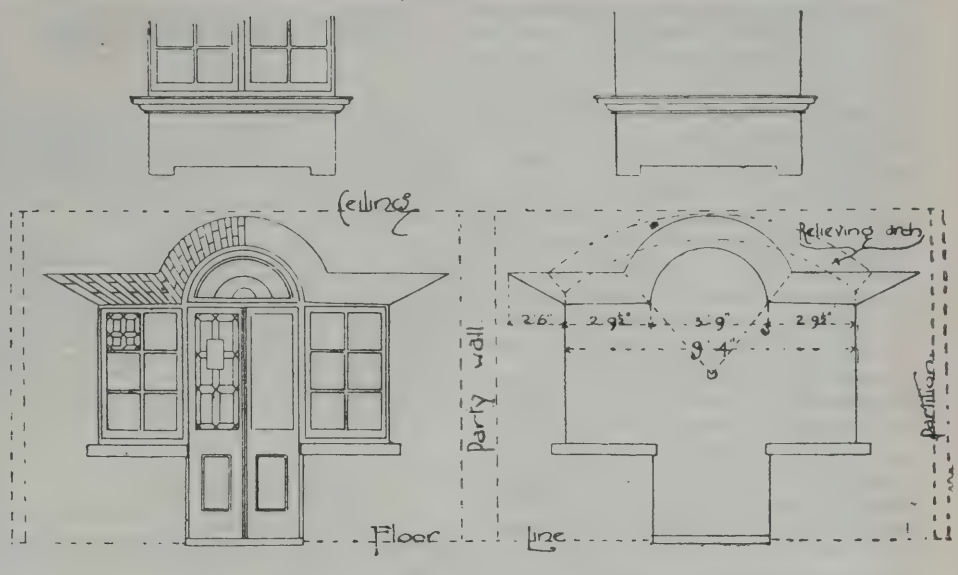
Correspondence.



A NEW STYLE OF ARCHITECTURE.

To the Editor of the BUILDING NEWS.

SIR,—Of late the battle which has seemed rage about the mixed question of a New Style of Architecture" has, from a ariety of sources, undergone many mollifying ıfluences, with the result that little or nothing as been done, or even is being done, towards tablishing the position, or otherwise of adancing anything towards elucidating the tally organic principle of "Originality in rchitecture." We seem to feel generally that, om the exceptionally prolonged nature of the onflict, we have been disconcerted, and become an ominous extent lethargic on this fundamental rinciple of our faith. From many the question, of ourse, elicits no response, and to the multitude, ho operate with the "muck rake" in the irection of the luscious 5 per cent., no force manating from such an ideal sphere could hope produce the slightest sign of animation, uch less to confer upon the principle continuity existence. We settle down, whether conciously or unconsciously, into a state of coma, largely imbued with the conclusion that all attempts at originality are peculiarly the exclusive sphere of the genius, and that the genus "genius" is, so far as all authorities of the present day are concerned, a practical nonentity. Into this slough of despond we are rapidly sinking, and are stupefied and benumbed by the bewildering forces which threaten our annihilation within the fatal precincts of this vortex. Some, however, endeavour to shake off and to disengage themselves from this soul-destroying sense of despair, and to endeavour, with whatever degree of success, to still keep their eye fixed upon the lofty ideal set before them—in whatever manner the ideal may have become tarnished, and their mental vision obscured. With false lights and false prophets and false standards of architectural orthodoxy, induced by the tyrannical conventionalism of the day, the architectural pilgrim is confronted with many difficulties in pursuit of the ideal, and the hope by which he is spurred on is largely qualified by an admixture of doubt—that accursed canker—as to whether there be any power to confer originality or ideality whatever. In this very hopeless condition the rising generation is called upon to take up the question, to assume the mantle which falls from the vanishing form of its predecessor, and to declare its faith in the sustained vitality of architecture, or to retire from the battle wounded to the heart with the poisoned arrow of scepticism. This is our architectural position at the end of the 19th century. But very little introspection is exercised with regard to our position, either subjectively or objectively. Why is this? Because we are not taught to philosophise upon the grand purposes of architectural life, and, becoming acquainted with them, to attempt to fulfil them. But if our leaders of thought have indefeasibly concluded that genius exists not, and that originality, in so far as architecture is concerned, in the development of fresh forms of architectural expression as the expressive language of the emotions, is defunct, then by so *ex cathedra* a declaration all further argument is precluded. But we have yet to determine and set limits, if the signification will admit of such restrictions, to the precise meaning of the term "Originality in Architecture"—in other words, to know what we have to do, the exact position to be attained, and then to select the choicest and most appropriate means to accomplish it. There are, then, as a preliminary to the evolution of any new style of architecture, three questions of fundamental importance requiring to be formulated and answered, and failing the determination of which all other questioning is futile and inert—viz:

1. Is originality in architecture possible?
2. What is originality in architecture?
3. Given the possibility of originality in architecture and its determinate character, what are the forces and conditions essential to its attainment?—I am, &c., CHAS. R. GUY HALL.

13, St. Alban's-road, Kensington.

ARCHES.

SIR,—As there is a difference of opinion amongst your readers as to the reliance to be placed in these self-supporting arches, I inclose tracing from original drawing (which I hope you will kindly find space for in your valuable paper) of two arches built from my designs some five years ago. They are set in putty, and show to the present day neither flaw nor crack. They carry the 4½in. face of the brickwork, and a retiring arch carries the 9in. at the back. The centre the voussoirs are cut from is found by a line intersecting the intrados and extrados at the meeting of the springing of the semicircular portion. They have a rise of ⅝in. in the 2ft. 9½in., and are 12in. on the face. The openings are to the drawing-room, and lead out on to balcony at the back of a pair of large Queen Anne semi-detached houses. On the summit of the Brockley Park Estate, near Honor Oak Park Station, there are also other specimens of brickwork of an unusual character. I shall be happy to give any further information on the subject.—I am, &c., T. W. GARROOD.

416, Mansion House Chambers, E.C.

SCALE AND SKYLINE.

SIR,—Your interesting article in last week's BUILDING NEWS on "Scale and Skyline" is a little misleading in its references to the "Monster Hotel" next the Adelphi-terrace. In the comparison drawn between the hotel and the terrace, it is stated that "doors, windows, stories are all magnified as if they were intended for a Brobdingnagian race," and if your writer thought he really observed this, the "kind of paradox" in his mind is easily understood. No such large doors or windows exist in this building. For instance, the sash windows of the first floor are 4ft. 3in. by 8ft. 6in., and the corresponding windows in the Adelphi are 4ft. by 8ft. These dimensions are given from actual measurement, and not from observation.

The height of the first-floor rooms in the Adelphi, and this letter is being written in one of them, is 13ft., and the height of the first floor of the "Monster Hotel" is 13ft. 4in. So much for this second "increase of magnitude."

As to the overpowering of Cecil-street referred to, if your observer had gone round to the Strand front he would have seen the magistrates' notices as to the closing of both that and Salisbury-street for rebuilding, and as this rebuilding will be on a similar scale to the hotel, there will be no adjoining building to suffer by comparison except the Adelphi-terrace, and since they plastered the face of that it has little more architectural merit to care for than a terrace in Pimlico.—We are, &c.,

THE ARCHITECTS OF THE "MONSTER HOTEL."

9, John-street, Adelphi, October 12.

VANDALISM ON THE EMBANKMENT.

SIR,—There is no finer urban prospect—there is no nobler architectural panorama in Europe—than the line of magnificent buildings (seen best from the southern end of Waterloo-bridge) having Somerset House as the centre, and including the beautiful Gothic of Arundel House and of other buildings on the Duke of Norfolk's estate, the central offices of the London School Board, the Temple Library, Barry's characteristic structure in the Temple-gardens, Zion House, and the City of London Schools.

It is in the very heart of this grand view, unequalled in Paris or Vienna, and which even bears favourable comparison with the finest perspectives in Venice or Rome, that some barbarian (I know not who) is raising two monstrosities for some branch Government department, in the commonest brick, without the least appearance of ornament or design, and utterly devoid of architecture of any kind.

To my mind, the river-front of Somerset House, in its beautiful stone and stately style, presents one of the most dignified aspects of any building in London. That there should be additions to this historic edifice in ugly, common brick (above the skyline)—additions which bear no relation whatever to the style or proportions of its parent building—is an emphatic disgrace that we must not, and cannot, permit.

If such an eyesore be allowed to blot what is unquestionably the most magnificent architectural prospect in Northern Europe, alas! for all lovers of the beautiful—the fit. Let our cities be abandoned to the jerry-builder, and let architects cease to aspire. The many hundred thousand workmen who have laboured to raise upon the Thames Embankment buildings worthy of their manhood, have laboured in vain.—I am, &c.,

T. Mullett Ellis, A.R.I.B.A.

28, Essex-street, Strand, London, Oct. 14.

BRICK v. STONE HOUSES.

Sir,—Referring to letters in recent issues of your paper on the above subject, I do not see why a brick wall, if built with a cavity or hollow of two or three inches and well tied together with cast or wrought-iron clamps of some approved shape, should not be as good or better than solid stone walls 18in. or 20in. thick, very often filled up with poor mortar and rubbish that only serve to retain the moisture when once it gets in.

Another cause may be this—the stone throughs, which ought to be higher by an inch or so inside the wall, are sometimes carelessly left level or dipping down. When this happens I think the wet will follow, as I have noticed patches of black spots about where the throughs came.

I think this question is a most important one in the interests of the general public, and trust that some practical builder will give his opinion and enlighten—Yours, &c.,

Another Ignoramus.

CHIPS.

The total estimated cost of the Exhibition Buildings in Chicago, as now planned, is £1,084,286. These buildings will cover 100 acres, and the estimates do not include internal decoration and furnishing the buildings. Nearly all are to have sky-light roofs of iron and glass. Their walls will be covered with "staff," treated so as to represent marble, granite. In the smaller State buildings, construction generally will be of native woods and stones, so as to display the varied resources of the country in building materials.

An important railway project affecting Hull is to be revived. It is a proposal to tunnel or bridge over the River Humber, in order to open up a new and shorter route to London and the Midland counties. Sir E. Watkin has declared the project feasible. If successful, it will revolutionise the course of traffic in the Northern and Eastern counties.

Plans have been prepared for new organ-loft, vestries and heating-chamber at the parish church of Bishopton, Ferryhill, and the works will be proceeded with in the spring. The architects are Messrs. Clark and Moscrop, of Darlington.

A large church clock, with three dials and striking the hours and half-hours, has just been erected at Hayton, near Carlisle, by John Smith and Sons, Midland Clock Works, Derby.

The new board schools, North Ormsby, Middlesbrough, are being warmed and ventilated throughout by means of Shorland's patent Manchester Grates, the same being supplied by Mr. E. H. Shorland, of Manchester.

The new half-timbered range of stabling, &c., in connection with Beech Holme, Colwyn Bay, North Wales, for Mr. W. H. Cogswell, of Calcutta, has been designed by Mr. T. E. Lidiard James, architect, of Lonsdale Chambers, 27, Chancery-lane, London. The fittings are by Messrs. Musgrave and Co., the builder being Mr. J. Berth Jones, of Llanrwst.

During the past week the authorities of St. Pancras have removed the obstructive gate in Upper Woburn-place, and in a few days two great north and south thoroughfares will be open to traffic.

Intercommunication.

QUESTIONS.

[10646.]—**Damp.**—Will readers give me any hint as to the best means of getting rid of appearances of damp in walls, which only appears when gas is lighted. The house in which the damp appears has been built four years, the external walls are 14in., partition walls 4½in. The damp appears most round architraves in 4½in. walls on each side of fireplace in external walls. Any information will be gratefully received by—F. E. B. S.

[10647.]—**Scantlings of Joists.** — Would Mr. Middleton, or some other kind friend, explain the following, more especially as to the mode of finding the scantlings of the wood and iron joists? There is a four-story warehouse, 36ft. by 24ft. in the clear, with two columns in the axis of its length, dividing the building into bays 12ft. by 12ft. The columns carry pairs of rolled iron joists, and wooden joists run from outside to outside wall, resting on the iron joists in their centre. The floors have to carry a weight of 3cwt. to the foot. Calculate the scantling of the wooden joists 14in. centre to centre from the formula—

$$w = \frac{c\,b\,d^2}{l}.$$

Where w = breaking weight in cwts.;
c = 8 for distributed weight;
$b\,d$ = breadth and depth of joists in inches;
l = span of joists in feet.

Safe weight = equal ¼ of breaking weight. Also calculate the scantling of the rolled iron joists from the formula—

$$w = \frac{c\,a\,d}{l}.$$

Where w = breaking weight in tons in centre;
c = 6;
a = area of bottom flange;
d = depth of joist;
l = span in feet.

—Sandow.

[10648.]—**Sign on Granite Facia.**—I have to put a long name on the frieze of a granite cornice. The occupiers being only tenants, the letters cannot be cut in the same. I have specified 6in. letters, cut out of 14lb. lead, each letter to be pinned to the granite, small holes being drilled and filled with Portland cement, into which the pins would be driven before the cement sets. I should be glad to have my idea criticised, and would be obliged for any other suggestion as to the material proposed for the letters and method of fixing.—Sign.

[10649.]—**Load.**—What safe load per foot super. will stock brickwork in mortar and in cement carry?—Tons.

REPLIES.

[10632.]—**Lift and Force Pump.**—I expected some practical man would reply to "Seliba's" query as to "Lift and Force Pump." The sizes of tail or suction-pipe, and rising main or delivery-pipe, appear to be right enough. The defect is probably in the "two bends" in the discharging (before called "delivery") pipe, if they trap air. It is presumed that the height from water in well to working barrel of pump is a foot or two under 30ft., and that the height from pump to tank is not unusually great. The end of the tail pipe may be run into mud or *débris* in the well, or may draw air for want of water, or dirt may get under the clack-valve.—M. M.

[10634.]—**Brick as a Building Material.**—The reply of "Brickwork" to the query of "Ignoramus" is not satisfactory. The number of joints has little or nothing to do with the matter if properly done, nor does any stone attract "atmospheric moisture." Dense, unabsorbent stones condense moisture on the surface, when colder than the atmosphere, and show the moisture as they do not absorb it, and give it off again gradually. A local prejudice against brick, and in favour of stone, implies that the local bricks are bad, and the stone good. Under ordinary circumstances, bricks are quite as good as stone for house-building.—M. M.

[10641.]—**Floors.**—"G. C. B." is quite right—that "laid folding" is obsolete for workmen, even as to "the very commonest broken-joint floors," although retained by surveyors to imply inferior work. But is not "broken joint floors" nearly, if not entirely, as obsolete? So that to many workmen and others it has become unintelligible. Some workmen think that the "broken joints" apply to headings, instead of the longitudinal joints. Cramps, and even wedges, have superseded "folding," and, with prepared flooring, have banished "broken joints," unless where Jerry Buggins rules the roost.—M. M.

Messrs. J. B. Joyce and Co., of Whitchurch, have just erected a clock, striking the hours and showing time on four copper dials, in the Academy, Fortrose, N.B., and which was presented by Mr. J. Douglas Fletcher, of Rosehaugh, Inverness.

A board of army officers at Aldershot have just completed plans for converting the former male and female convict prisons at Woking into barracks for the accommodation of two infantry battalions, to form part of the Aldershot command, and the plans are to be submitted to the Secretary for War, it being intended to complete the conversion in the course of next year.

At the meeting last week of the London School Board, the chairman of the legal committee reported that Sir Richard Webster and Mr. Henry Sutton had given their opinion that the Board should take no further action with regard to proceeding against Mr. E. R. Robson, the late architect of the Board, for neglect of duty in respect of the defective building of the Kilburn-lane school. The report was adopted, and the reference to the committee was discharged.

Legal.

NOTICE TO QUIT.

The giving of a notice to quit is usually a ve simple matter, yet it is the occasion of mu bungling. The length of the notice, of cour depends on the term. For a yearly tenancy must be six months, expiring at the same quar or date as that from which the tenancy beg But here it is a point worth noting that if tenant goes into possession at the half or a other broken part of the quarter, and pays t odd rent up to that quarter, the law regards tenancy as beginning from that quarter, and r from the date of entry, and the notice must given to end then accordingly. Of cour notice can be given verbally; but it is better writing, and a copy should be kept and indors with date and mode of service. If sent by po it will only date from the time it would, in t ordinary course of post, be delivered. It is good plan to send such notices in a register letter. It is a popular delusion to think that a stamp is needed, or that any witness to signatu is necessary.

Another common delusion is as to the time day in which such a notice must be given. The is no rule about serving it before noon, a indeed the law does not split days. The clea and simpler the notice is, the better, so long as specifies the premises, and the time of expi No sort of condition should be attached. One the most constant popular errors is that re cannot be taken or distrained for after the noti is served; but this is only true so far as applies to rent falling due after the noti terminates, and if such rent is taken, of cou the notice is now waived, and a new tenancy created. But rent in arrear or becoming due end of expiry of notice can be distrained sued for in the ordinary course. An agent w receives the rent can give or be served with notice to quit on behalf of the landlord. Wh a tenancy expires by effluxion of time, clearly notice is needed unless such has been agre upon, and yet though this looks obvious, it often a cause of doubt with tenants.

Fred Wetherfield, Solicitor.

1, Gresham Building, Guildhall, E.C.

Note.—All questions for reply in this colun must be headed "Building News," and mu reach my offices, as above, by Thursday morni each week.

R. C. D.—Fixtures.—A timber-framed house built laid upon a brick or concrete foundation, and capable being taken off without touching the soil, would r become the landlord's property, and could be removed the tenant at the end of his term, if it were separate fr the structure of the demised premises. It is on t principle that wooden sheds standing on brickwork ap from the building, have been held removable, while conservatory or verandah, though not let into the s were considered fixtures, because attached to the dwellin house, and so to the freehold.

Constant Reader.—Design.—The drawing, plan, elevation of a building could not be registered und the Patents, Design, and Trade Marks Act, as su designs cannot come within the definition given by s. of that statute, or under any one of the clauses arranged in the Rules. There would be the furth difficulties that a design to be registered must be new a original, and not have been previously published—co ditions with which ordinary buildings could hard comply.

The dedication of the new organ at the Exet Cathedral was held on Friday afternoon. T instrument has been built by Messrs. Henry Wil and Sons, of London. A memorial-tablet in t same cathedral to the memory of General S Howard Elphinstone, who was drowned off Usha eighteen months since, was unveiled by Col. Fre mantle, on the same day.

A portrait of the late Mr. John Clayton, Chester, was presented to the city council of Ne castle-on-Tyne on Wednesday week. It is by M H. T. Wells, R.A., and is hung in the newl decorated council-chamber. Mr. Clayton w town clerk of Newcastle for 45 years, and h father for 37 years before.

One of the landmarks of the village of Sleights the old Hall—has just been pulled down, and t work of re-erection has begun. The old Hall, c to call it by its proper name, Sleights Hall, w purchased, along with certain lands and farms, b Mr. Thomas Fishburn, shipbuilder, of Whitb rather more than 100 years ago. The new Hall being erected close to where the old building stoo the architects being Messrs. Clark and Moscrop, Darlington, and the contractor for the buildin Mr. R. Harland, of Whitby.

LEGAL INTELLIGENCE.

IN RE W. H. TURNER, ARCHITECT, GROCER, AND LICENSED VICTUALLER.—Under a receiving order granted on the 17th ult. against William Hunter Turner, described as an architect and surveyor, of 58 Finsbury-pavement, a statement of affairs has been submitted showing liabilities £874, with assets £24. It transpired that the bankrupt traded for some time at shops in different parts of London as grocer and wine merchant, and also in partnership as a licensed victualler. He states that, having received £300 for his share of an inn in Tenham Court-road, he, in April, 1888, started again architect and surveyor. He attributes his insolvency to loss in the grocery business, and by bad debts since April, 1888, and to his household and personal expenditure having exceeded his profits, by reason of his having been incapacitated for some months, in 1889, by a severe illness. The Official Receiver states that the bankrupt has produced a book purporting to show the details of work done as an architect and surveyor, but that he has kept no other book of account.

ACTION BY SEWERAGE CONTRACTORS.—At Ramsey on Friday and Saturday, before Deemster Gill, the case of Messrs. Holme and King, contractors, of Liverpool, against the Ramsey Town Commissioners was opened. The suit is brought for £3,695 balance claimed under a contract between the parties for the construction of the sewerage system on the Mooragh Estate. The commissioners contend that only £7 is due, which they tender, their engineer, Mr. Mansergh, having certified to that effect. The plaintiffs assert that the money is due for extras caused by deviations, authorised by Mr. Mansergh, from the original scheme.

THE WEST HIGHLAND RAILWAY DISPUTE.—Sheriff-Substitute Gebbie has issued judgment in the case by the West Highland Railway Company against their contractors, Messrs. Lucas and Aird. He finds that the pursuers have accepted the tenders' measurements as fixing the quantities of the work executed by them, and therefore authorises the pursuers to carry on the railway works, to re-let the same, or part thereof, and for that purpose to take possession of the works, and all materials, tools, and implements, and declares the interdict formerly granted perpetual. He also finds the pursuers entitled to expenses.

CLAIMS ON THE COCKERMOUTH RURAL SANITARY AUTHORITY.—LARGE CLAIMS AND SMALL PAYMENTS.—This authority, in constructing works of water supply, laid water-pipes through the land of Mr. William S. Parkin, of Lincoln's Inn, barrister-at-law, in the township of Great Broughton, upwards of seven years since, and recently of Seaton, and a claim was made by the owner for payment for such easement, &c. The claim was referred to Mr. Watts, of Workington, on behalf of the owner, and Mr. Richardson, of Carlisle, on behalf of the authority; but as these gentlemen could not agree upon the appointment of an umpire, Mr. Hodson, C.E., of Loughborough, was appointed umpire by the Local Government Board, upon the application of the authority, under the provisions of the Pubic Health Act, 1875. The umpire held his reference at the Green Dragon Hotel, Workington, on the 1st of September last, and other days, having previously inspected the premises. Mr. Milburn, solicitor, Workington, appeared on behalf of the owner, and Mr. Musgrave, of Cockermouth, the clerk to the authority, on the Board's behalf. Mr. Parkin claimed the sum of £500, and evidence was given on his behalf by Mr. Potts, Mr. Woolcock, of Whitehaven, and Mr. Castiglione, of Workington; and the case of the authority was suported by the evidence of Mr. Paisley, Overend; Mr. Richardson, Carlisle; and Mr. Pickering, Whitehaven. The arbitrator has by his award directed the sum of £6 9s. 6d. (which does not exceed the amount offered by the authority) to be paid to Mr. Parkin instead of his claim of £500, that Mr. Parkin pay his own costs, and also one half of the costs of the arbitrator, and his award (the total cost of the arbitrator and award being £5 19s. 1d.) At the same time the arbitrator adjudicated upon a claim of £100 made by Messrs. Milburn, of Seaton, for easement of laying pipes through their land there, the claimants and the authority being respectively represented by Mr. Milburn and Mr. Musgrave. The arbitrator has, by his award, directed the sum of £3 10s. (the amount actually offered by the authority) to be paid to Messrs. Milburn; that Messrs. Milburn pay their own costs, and also one-half of the costs of the arbitrator and his award (the total cost of the arbitrator and award being £24 12s. 1d.)

DELAYS ARE DANGEROUS.—Mr. James Hunt, builder and contractor, of 81, St. John-street, was summoned to the City Guildhall at the instance of Mr. Hugh McLachlan, district surveyor of the Western division of the City, for that on April 30th, 1891, in doing certain work in respect of a building situate at 12, Little Britain, he did form a roof over the rear portion of the main premises with its lower planes of the surfaces of the roof inclining from the external and party-walls at greater angles than 47 deg. with the horizon, contrary to the Metropolitan Building Acts 1855 (18 and 19 Vic. c. 122 sec. 46). And that he did omit to carry up the party-walls above any part of any roof opposite thereto, and within 4ft. from such party-walls, contrary to Sec. 7 of the said Act. Mr. Raven, for the defendant, took an exception that the district surveyor had served his notice of complaint weeks after the building had been completed. Mr. McLachlan said the delay that had arisen was owing to the fact that there was a considerable amount of correspondence on the subject.—Sir Andrew Lusk: Was the place finished before the notice was served? Complainant said he believed the building was finished before he served the notice, but he had been corresponding on the matter for some time. The Alderman held that the district surveyor had acted wrongly, and dismissed the summons, refusing a case for the superior courts.

INHABITING A HOUSE WITHOUT A CERTIFICATE.—IMPORTANT DECISION.—Mr. J. H. Pemberton, a financial agent, of Manchester, was charged at the County Police-court, Strangeways, on the 1st inst., before Messrs. J. H. P. Leresche (stipendiary) and W. W. Cooke, with letting a house at Urmston, within the district of the Barton Rural Sanitary Authority, for human habitation, without having first obtained a certificate from the surveyor to certify that the house was fit for habitation. Mr. Crofton (Messrs. Crofton and Craven), instructed by the clerk, Mr. Henry Whitworth, represented the authority, and stated that the defendant had built a large number of houses in Railway-road, Urmston, one of these being let to Mr. Maddocks, who would be charged with occupying the house before the surveyor to the authority had certified that the same was fit for habitation. Mr. Hooley, C.E., surveyor to the authority, proved the case, and was cross-examined by Mr. Pemberton, who endeavoured to show that he was not the responsible party, not being the owner. Mr. Pemberton, in reply to the bench, explained in a long statement, that he was the agent. The bench informed Mr. Pemberton that they fully understood his position, and that the case had been proved, and he would be fined the full penalty of £5 and costs, or in default, one month's imprisonment. Mr. Crofton, by consent, withdrew the summons against Mr. Maddocks.

IN RE J. TROLLOPE.—Under a receiving order made against James Trollope, builder and contractor, of Bond-court, Walbrook, and of Lower Walmer, Kent, a statement has been furnished showing liabilities £12,271, of which £2,511 are unsecured, with an estimated surplus in assets of £1,064. The debtor began business about twenty ago, and has since been mainly engaged upon contract work for the Government. In 1888, he sustained a loss on the building of the sea-wall at Deal, and since that year he has carried on his business with the assistance of persons who have financed him under arrangements as to share of profits. In 1881, he also entered into partnership with another person, and they traded at Camberwell and Mitcham as varnish manufacturers until 1883, when the firm was dissolved. He attributes his failure to his inability to realise house property built by him, the mortgagees of which are now in possession.

SERIOUS CHARGE AGAINST AN ARCHITECT.—At the Teddington Sessions on Monday, Arthur Muckleston Leach, 38, surveyor and architect, carrying on business at the London Joint Stock Bank-buildings, Smithfield-market, and Henry Cove, a coffee-house keeper, of Mormon-road, Bermondsey, were charged on a warrant with having conspired together, with another man not in custody, to obtain by false pretences from the Liverpool, London, and Globe Insurance Company £550 with intent to defraud.—Detective-Inspector Dennie stated that after a fire had taken place at the Rocks, at Bedfont, on July 16, he found that the prisoner Leach took the house, a man named Adams, not in custody, but who was wanted, being with him at the time. After the house had been burnt down Adams went to the company's offices in support of a claim made by Leach, whose furniture had been insured with the company. Cove was also a companion of Leach's, and he visited the house with the prisoner an hour and a half before the fire occurred. Subsequently to the fire Cove also went to the office in support of Leach's claim. Leach made a declaration that he had never before made a claim upon any insurance company. Four fires had occurred upon premises of which Adams was the occupier, and in which the property was insured. In each case the fire followed a few months after insurance, and there were suspicious circumstances attending all four. Leach had had some small fires, for which he had made claims upon the Northern Insurance Company. Cove had occupied the premises where some of the fires mentioned had occurred, he acting as manager of the premises. The furniture which was burnt at the Rocks was insured by Leach on October 29, 1890, for £350, while he was living at 175, High-street, West Norwood. It was removed to Bedfont on July 15 last, and on the 26th of the same month, at the request of Leach, the insurance was increased to £550. The fire took place on the 16th of the following month.—Mr. Higgington, a clerk in the employment of the insurance company, said Leach had claimed for the full amount, and valued his furniture at £796 1s. 9d. In a letter dated September 8 Leach had offered to accept £210 in full discharge of all claims against the company.—A domestic servant gave evidence showing that things mentioned in the claim by Leach were never in the house at all.—Samuel Penn, the owner of the Rocks, deposed that after Leach's house and the adjoining one had been burnt down, there was a very strong smell of paraffin on the premises.—The magistrates decided to remand the prisoners until Monday next, and they refused to accept bail, however substantial. It was stated that the Treasury would take up the prosecution.

STONEMASONS' WAGES AND TRADE CUSTOMS.—Mr. Bushby gave judgment at Worship-street on Friday in a dispute between a journeyman stonemason and his late employer. A man named Cates had summoned a member of a firm of stonemasons, having business premises in Worship-street for money for work and labour done. The case had occupied the court two afternoons, a number of men being examined to prove trade custom and rules, but the evidence was most contradictory. Cates, it seemed, had been employed as a mason on some repairs at Limehouse Church. When dismissed, at the end of a week—the working week ending on a Friday—he was offered his money at the rate of 9d. per hour for 57½ hours, but he refused to take it, though he had been paid during previous weeks at the same rate. He claimed to be paid for a portion of the time at the rate of 9¾d. per hour, and also claimed riding money 3d., overtime at the rate of time and a-half, grinding-money, and an hour's wages in lieu of notice. The dispute as to the ¾d. per hour resolved itself into a question whether Cates was a mere mason or a "mason's fixer." With respect to the overtime, it was said to have been done without orders, and that the men had gone on working instead of waiting idle for the arrival of their money on a certain Saturday. The masters' contention was that overtime could not be made without the orders of the master. In this case it was voluntary work. As to an hour's notice or payment, a number of journeymen, comprising builder's hands, foremen, &c., gave evidence *pro* and *con.*; but those for the complainant admitted that they had not ever given a master an hour's notice, and knew no instance of a journeyman doing it. Mr. Bushby decided with respect to the claim for 9¾d. per hour, that it could not be maintained by a mason because he, at the request of a foreman, did "fixer's" work for a short time. He disallowed that extra claim, and also the claim for riding money, as being unauthorised expenditure. The claim for time and a-half for "overtime" he allowed, as it was agreed to by the code of rules. The claim for grinding money was disallowed, because the journeyman could have had the tools sharpened by the employer in the usual course. As to the qustion of an hour's notice, the balance of evidence was against the men, and that claim was disallowed. Judgment was delivered accordingly, with 10s. costs.

CHIPS.

A new choir vestry has just been added to St. Cuthbert's Church, Darlington, called sometimes, from the beauty of its proportions, the "Lady of the North." A new carved and traceried oak screen has also been erected across the western porch, both from the designs and under the superintendence of Messrs. Clark and Moscrop, architects, Darlington.

The boys' department just added to the Lady Vernon Memorial schools, Gateshead, will be opened by the Marquis of Londonderry to-morrow (Saturday). The new school is a separate building accommodating 480 boys, and is built of red brick, faced with stone. Mr. Stephen Piper, M.S.A., of Westgate-road, Newcastle-on-Tyne, is the architect.

A movement is on foot at Glasgow for the institution of a Society of Ceramic Art for the study, examination, criticism, and discussion of antique and other pottery, porcelain, glass ware, stained glass, and enamels, and to afford collectors of the antique, antiquaries, archæologists, and students of industrial art a medium of communication and interchange of opinion on the subject of ceramic art and cognate matters. Mr. Oscar Paterson is the organiser.

An infants' school in Brook-street, Carlisle, was opened on Monday. It has been erected under the supervision of Mr. T. Taylor-Scott, F.R.I.B.A., of Carlisle, with Mr. J. D. White as clerk of works. The style is Gothic, and the material used red Cumwhinton bricks and white stone dressings with Buttermere green slates. The chief contractors were:—Builder, Mr. John Laing; joiner, Mr. J. H. Reed; and plumber, Messrs. W. and R. M. Hill.

WATER SUPPLY AND SANITARY MATTERS.

Birmingham Proposed New Water Supply.—At Tuesday's meeting of the Birmingham Town Council the water committee's report was submitted on the new scheme for a supply from the upper waters of the Elan and the Claerwen, in Wales. Mr. James Mansergh, C.E., has given an estimate for the first instalment of the works, which will be sufficient to deliver 26,000,000 gallons a day. The estimate for that is £4,340,700, including £435,728 for contingencies. The water committee have also estimated the cost of extending mains for ten years, and the cost of keeping their present works in repair during the ten years the Welsh scheme is in progress of development. They have reckoned those contingencies at £195,000, and have added £86,250 for two new reservoirs—one at Warley, to supply the high part of Edgbaston, and one at Northfield, these two sums bringing the estimate up to £3,621,950. Mr. Mansergh estimates that Birmingham will begin to want the second instalment in 1908, and a fourth in 1932. After some discussion the report was unanimously adopted.

Cambridge.—The town council have adopted the scheme of Mr. J. T. Wood, of Liverpool, for the redrainage of the borough. The scheme of collection is estimated to cost approximately £100,000. To this is to be added, as soon as the Corporation arrive at a decision, the cost of the purification or utilisation of the sewage. Mr. Wood has also been called in to advise the Chesterton Local Board, with the view to their combining with Cambridge for a joint scheme.

Deeside, N.B.—On Saturday the Deeside District Committee of the Aberdeen County Council adopted the report of Mr. G. Gordon Jenkins, C.E., Aberdeen, providing for a special water supply and drainage district for the village of Hoyne and its surroundings. The water is to be taken from the Dinnie Burn, on the Glen Lora property of Sir William C. Brooks. A reservoir will here be erected, and a three days' supply will be stored. By the new scheme the sewage of Hoyne, instead of being let into the Dee, will be distributed in an irrigation meadow. The total cost of the works is put at £3,950.

Labourers' Houses in Suffolk.—Colonel Pocklington held an inquiry on Friday at Ixworth under the Housing of the Working Classes Act, an application having been made by the Thingoe Rural Authority to the West Suffolk County Council for a certificate for the adoption by such sanitary authority of Part III. of the Act in the parish of Ixworth. Mr. Kilner, medical officer of the Thingoe Rural Authority, said he reported the Stow-lane Cottages in February last as dilapidated and unfit for human habitation, and magisterial closing orders were made. The cottages continued in the same bad condition. The same must be said of cottages in Comister-lane. It would probably cost more than most of the cottages were worth to put them in a proper condition. The only thing to be done was to reconstruct them. Most of the cottages were still occupied. With the exception of the eight cottages under consideration, the condition of house property in Ixworth was not worse than in the other 48 parishes in the Thingoe rural district. The solicitor of the Ixworth Labourers' Association contended that if it were necessary that more and better houses should be erected at Ixworth, they should be built without further delay. Twelve cottages could be built in Ixworth by the Thingoe Union at a charge of less than one penny in the pound per annum.

Water Supply from the Colne Valley.—Several members of the London County Council and City Corporation visited Rickmansworth on Saturday to inspect the wells belonging to Mr. George Webster, of Cannon-street, E.C. Under the advice of Mr. Claud Monckton, C.E., Mr. Webster has had a series of five wells sunk on his property at Harefield Grove and Springwell, near Rickmansworth. They vary in depth from 115ft. to 282ft., with boreholes from 24in. to 40in. in diameter, lined with steel tubes, carried down into the solid chalk. From the wells there are now already some ten million gallons of water per 24 hours available for immediate use, while it is conjectured that the supply could be doubled in volume. With a view to utilising this supply for the Metropolis, Mr. Webster has obtained easements, and has negotiated terms for conveying the water as far as Paddington. A reservoir capable of containing 5,000,000 gallons has already been constructed in an elevated position, and there is room for others, either for service or for softening purposes. Dr. Percy F. Frankland states that the water is of excellent quality for drinking and other dietetic purposes, and that its hardness is neither excessive nor much greater than that of the river water supplied to London. It is proposed to connect the wells at Springwell and Rickmansworth, and to pump the water up to the reservoirs, whence it would be conveyed by gravitation to the Metropolis.

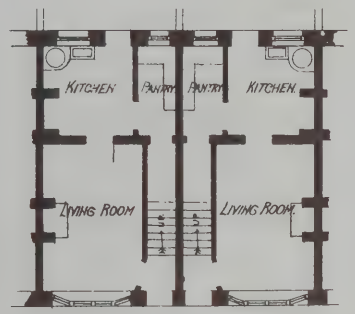
Our Office Table.

The new session of the Surveyors' Institution will be opened on the evening of Monday, November 9th, when Mr. R. C. Driver, who has been elected as president for a second year of office, will deliver his inaugural address. The Institution is rapidly increasing in numbers and wealth, and the premises in Great George-street, Westminster, although enlarged a few years since, are beginning to appear cramped, especially in library accommodation, and it is on the boards that within a few years the Council will have to build a home for themselves on a more commodious plan. The membership, which but four years since stood at 1,200, is now within thirty of 2,000, and it is probable from the nominations sent in that the first election after the new session is opened will bring the total to 2,300. A recent innovation in the direction of registration made by the Institution is to register, free of charge, the articles of pupilage of all young men entering the profession, whether indentured to members of the body or to outsiders. The next examination for the special certificate, which confers on members an honours diploma in (1) forestry, (2) sanitary science, and (3) land surveying and levelling, and is quite distinct from the ordinary examinations of admittance, will take place in June, 1892, and all entries of candidates must be sent in before the 20th April next.

The London School Board received, at their meeting yesterday (Thursday), a report from the Works Committee with regard to a letter from Messrs. Kirk and Randall, contractors, of Woolwich, dated 4th ult., stating that, on the 13th August they received an intimation from the Board that they had been selected to tender for the erection of the Kemsing-road School, Greenwich; that, on the following day, they replied that they would be pleased to submit a tender; that, on the 31st August, they tendered to carry out the work for £16,354; that, on the 3rd September, they received a letter informing them that the tender of Messrs. W. H. Lorden and Son had been accepted at £16,881: asking why they have been passed over, and the work given to a firm whose price is £527 more than theirs, and adding that it does not appear to be fair to them as contractors, nor satisfactory to them as ratepayers. The committee reported that Messrs. Kirk and Randall are in error in stating that there is a difference of £527 between the two tenders for the erection of the Kemsing-road school, the actual difference being only £121, when account is taken of the provision for building in cement. The committee mentioned that when the tenders were received at the committee meeting on the 31st August, the tender of Messrs. Kirk and Randall was lowest for another school (Trundley's-lane), the erection of which was then allowed to remain in abeyance in consequence of a difficulty with regard to the drainage, but the committee are now recommending the acceptance of Messrs. Kirk and Randall's tender for this school. In accordance with the recommendation of the committee, it was agreed a reply should be forwarded to Messrs. Kirk and Randall, reminding them that, as stated in the invitation to tender, the Board are not bound to accept the lowest or any tender.

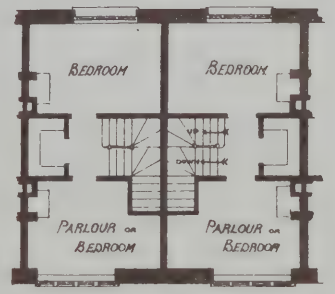
The difficulty of dealing with excessive rainfalls like those we have recently experienced, has been felt very much in Brooklyn and other large western cities. The construction of storm sewers of sufficient size to carry off heavy falls of rain has been variously entertained. Some engineers prefer the "separate" system, by which the storm waters are carried away by a distinct system of sewers, to that for the conveyance of sewage, which may then be small. But, as one writer says, the difference in cost is due to the difference of depth of excavation; in either case, the same duty of carrying away the storm water has to be met, and the same capacity of conduit required in either case. The question of which is the most desirable form of conveyance of excessive rainfall is one that will have to be decided before long. No doubt, as main sewers are in existence, and are found too small for storm water, owing to the growth of population, separate channels and drains ought to be provided for the storm water in most of our older towns.

Professor Von Pettenkofer, whose experiments on the permeability to gases of buildi materials are well known to our readers, h recently turned his attention to the self-purific tion of rivers, and has read an interesting pa on the subject at the annual congress of Germ Naturalists and Medical Men, held at Hal His researches and experiments were made on t waters of the river Iser at Munich. Munich h 280,000 inhabitants, and 20,440 kilogrammes refuse are carried into the river every day. B again, each day 3,456,000 cubic centimètres fresh water flow down the stream, so that t proportion of refuse or dirt to the water is or 6 to 1,000,000 or 6 milligrammes to the litre pollution which, if artificially produced in a gl of water, is unrecognisable to the naked e Analytical experiments show that even th pollution disappears less than five miles below t city. This self-purification of rivers has ger rally been attributed to sedimentary deposits, h Pettenkofer is convinced that it is the effects oxygen, partly freely dissolved in or absorbed the water, and partly produced by water plan He considers that the great quantity of low veg table organisms in water plays a great part in t purifying process. The vegetable growth river beds should, according to Pettenkofer, protected, and refuse water from mills, chemi works, &c., which is destructive to vegetal growth, should not be allowed to flow into rive unpurified.



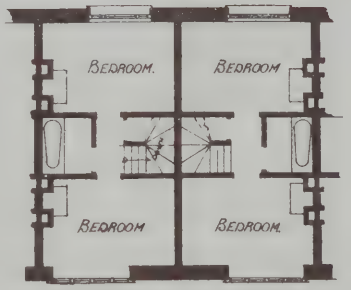
The death occurred in Newport on Frid of Mr. A. Gunn, who was for many years an t teacher in Wolverhampton. The deceased w appointed head master of the School of Art Darlington-street, about twenty-five years ag and on the opening of the Municipal School Art his services were secured in the sam capacity. About two years ago he resigned h office, and four months back he crossed t Atlantic to join his son, who is resident in t United States. The deceased gentleman, duri his long sojourn in Wolverhampton, w eminently successful as a teacher, and w highly respected.

The death by drowning is announced fr Siam of Mr. William John Galwey, M.Inst.C.E while employed as chief of the engineering st in the survey of the projected railway fr Bangkok to Chiengmai and Chiengsin, on t South-West frontier of the Chinese Empire distance of nearly 1,000 miles. Mr. Galwey, w was 60 years of age, began his career in 1855 assistant engineer on the East Indian Railwa and in 1872 was offered, and accepted, serv under Government on the State railways. T bridge over the Jhelum river, on the Punja Northern Railway, and the Empress Bridge, t foundations of which were laid in the bed of t stream, at a depth of 100ft. below water lev were his work; and his last Government emplo ment was that of chief-engineer-in-charge of t Rajpootana State Railway. He had worked the past two years in Siam, and had practica accomplished his mission.



Last Saturday night the first of a series conversaziones in connection with the Co-oper tive Builders (Limited), Burton-road, Brixto was held in Longfield Hall, Knatchbull-ro Camberwell. There was a large attendance members, relatives, and friends. The soci was founded in 1888. It is composed entirely working men employed in the building tra who divide the whole of the profits of the busin among themselves, the result being that since t foundation of the society they have receiv 1s. 6d. in the pound on their wages in additi to the formation of a large reserve fund and depreciation. The business amounts to ov £27,000 per annum, and would be larger if t society's capital would allow it to extend operations. During the evening Mr. J. C. Gra Secretary of the Co-operative Union, deliver an address on the benefits of Co-operation, a congratulated this local society on the success had achieved.

The bust of the late Sir Robert Fowler, model by Mr. Walter Merrett, has been selected by t Library Committee of the corporation from amo those submitted to them in competition. It will executed in marble and placed in the Guildhall.



The Vienna Reichsrath on Tuesday passed a B remitting about one-half of the very heavy taxes dwelling-houses for the term of 20 years upon artisan dwellings, on condition that the re demanded does not exceed a certain defined li per square mètre.

E PUBLIC AND THE PROFESSION.

WHILE the professions of law and medicine are respected by the public, t of architecture is regarded with an ifference which seems to corroborate the adage that "familiarity breeds con-ıpt." Both the former are protected and ced round by law, while that of archi-ture is open to all comers, and is not requently practised by men who have tainly very little special or technical alification to produce. We have often ndered at and lamented this indifference; when we come to think, it is the same h all institutions which are free and open, ile those which are closed are more highly oured. We cannot be surprised, knowing general tendency of the human mind, to imate more highly matters and qualifica-ns that are beyond the reach of the ny. Architects themselves are beginning estimate their position, and to make a vement towards some kind of statutory otection, and the example set in this ıntry has been followed by the profes-n in the Dominion of Canada and in toria and other Australian colonies. e idea is to close the profession, to set ound it distinct boundaries, and to make ess accessible to ignorant pretenders. The des connected with building are also alive the same movement. They have dis-ered that it is to their own interests to rk off their crafts from others, and to otect themselves by trade organisations. e same kind of positive and circumscribed owledge is assumed everywhere. Even igious bodies are struggling for recog-ion and supremacy by federation and ıer means. One of the strongest elements the life of a profession, as it is of bodies l institutions, is to have a circumscribed, ed, and positive character. The least ccessful are those which are lati-linarian and invertebrate in their aims. chitecture, unfortunately, has been too g of this broad and limitless character. has fraternised with extremes; on one e with those who have no taste for art, l who would abolish the profession if y could as useless and expensive, and h others whose art-fanaticism has carried m to the extreme of ignoring all ordinary mmon-sense rules. In other professions, re are agnostics and orthodox believers,— the medical, for example,—but in the ks of architecture we find men of these treme views very frequently — many o are not particular about professional quette, and would not mind doing un-fessional things, such as underbidding established fees, and in taking contracts l commissions; others who do their work proxy. The public are quick in detecting se irregularities in practice; in finding t, for example, that there are architects be had who will give their services at f the recognised fees, and undertake any rk even though they are incompetent. eir estimate of the profession is lowered consequence. The results of legal isions have also not been favourable to profession in many cases. On the other nd, we find that intelligent people prefer deal with men who have a high view of ir profession, who carry out their work on nciple, especially with those who confine mselves to their special art. A profession ich has many "jacks of all trades" cannot regarded without suspicion; on the other nd, a defined art in which precise views held is esteemed.

The interference of clients with architects is one of the results of the estimate in which the art is regarded. The lay mind can see nothing in it but what it can comprehend. They note buildings of various styles and arrangements, and they attach very little importance in their own minds to an art which seems one of whims and fancies. Few people would think of questioning a medical man as to his competence in dealing with a disease; they would certainly hesitate to interfere with his mode of treatment, and why? Because they know the subject is beyond their knowledge. In matters of law also they would not venture to interfere; but in building, the same persons would not scruple to call in question the architect's opinion, and to insist upon their own views being carried out, the reason being that architecture is an art based on common-sense requirements; building is a mechanical sort of business, which most people imagine that they can master, while both law and medicine are hedged round by technicalities, statutes, and a terminology which are sufficient to frighten the most inquisitive. No doubt from a professional point of view this is one of the disadvantages of belonging to a vocation which is too easily comprehended by the public, and which is so often followed by amateurs. There is an advantage in being able to throw a veil of mystery over a profession or a craft. On these grounds we cannot but see an advantage in rendering the profession and its art less accessible to the many. The Architectural Association, in its new curriculum, has been working on these lines, the amateur element of the old classes having given place to a strictly professional course of study.

There are two classes of the public, those who are ignorant of architecture, and those who know a little. It cannot be doubted that the latter are the most implacable in their demands upon the architect. They want something, they do not know exactly what. In their dealings with the architect they are to a large degree dependent on what they have seen; but as they cannot find the means of conveying their requirements, they are ceaseless in their interference. The really ignorant client relies implicitly on his adviser; he may be troublesome about cost—want to know a great many things as they occur on the building—but he trusts. One of the most common kind of interference is that of questioning designs. The architect is perhaps coolly told that some other building is perfect, or that Mr. Somebody's architect has arranged this or that very well, and that he, the client, should like it followed. Now this is, to say the least, a gratuitous insult to the adviser, and really is tantamount to telling him that he has yet to learn his business. A man may be forgiven for expressing his satisfaction with a certain building; but a request that his own plans should be altered to make them like something else, is really to call in question the judgment and taste of one's architect. We cannot be surprised if such interference calls for indignant protest on the part of a professional man, for it is equivalent to a patient telling a medical practitioner that some other doctor's prescription is more suitable. Of course, if we consider the question, it is really setting up one's own opinion and acting on one's own judgment, to say that this plan must be altered to agree with something else. The extraordinary thing about the matter is that clients of this kind do not see the absurdity of engaging an architect to prepare plans for them, and afterwards ignore them for not doing, as they think, right. Why not employ a draughtsman or a builder to make designs according to some example?—which procedure would be far more reasonable. The experienced architect knows how to deal with clients of this sort, and would tell them plainly what he thought of a suggested amendment that did not approve itself to his mind. Numerous cases of this kind occur, and are occasionally reported in legal proceedings; but it is worth while to notice one thing about this treatment—namely, the very vague and imperfect notion of the architect's office entertained by clients of this sort. The supposition explains, indeed, much of the anomalous condition of the profession; how little the employer understands the real function of the architect; how frequently he regards him as a mere copyer or vendor of designs. Such clients think that the design of a building is a sort of mechanical art; that, given certain requirements, the architect has only to apply easy rules to produce a design, or that designs are like tailors' patterns, ready prepared, and only to be selected by the owner. This last idea, perhaps, is the more common one amongst people who know very little about the art. Practically, as anyone can see, it transfers to the owner the responsibility of selecting or accepting a design, the architect simply becoming a passive agent, leaving the matter in the hands of the employer. The profession, unfortunately, encourage this idea by acting in the way they often do. For instance, they cater to the taste of their employers; they undertake to prepare several sketch plans for approval, and are willing to design "to the order" of the client, whatever it may be. No practice can be more inimical. Imagine, for a moment, a professional lawyer, or doctor, or sculptor placing himself at the disposal of his employer in this manner, agreeing to follow his wishes, however contrary it may be to his own judgment! Yet this is precisely the position of the architect when he agrees to submit designs for his clients' approval, and when he alters and amends his work, till it is absolutely not his own at all. How can we expect the public to respect a profession which is so condescendingly pliable, which appears to have no decided views about points of plan and style? Very naturally, such persons draw their own inferences; they conclude that there are no principles or canons of art; that there is very little science about building, and therefore the duty of "drawing" plans is very easy. These are the people who dispute the ordinary percentage, commission, and fees, and who think it no wrong to retain drawings and make use of them. How can they think otherwise, when architects deal so lightly and complacently with their skill and experience?

Mistakes in practical matters, such as bad drainage and sanitary arrangements, imperfect ventilation, and faulty construction have materially diminished the public appreciation of architects' services. When we come to consider that these defects or failures are often owing to the deference shown by architects to their clients—as, for instance, in the process of cutting down cost by using inferior materials, and adopting arrangements of faulty character—we are forcibly reminded of the suicidal policy of too readily acceding to the wishes of clients. We by no means counsel an obstinate refusal to admit alterations in plan or design when they are evidently improvements. No professional man exhibits much discretion in shutting his eyes to suggestions of value, even when they are shown in works by rivals.

We deprecate, however, the playing into the hands of a vacillating and ignorant client, the acceding to every whim, the making alterations which the architect knows are wrong, and, in short, acting as if he were carrying out, not his own, but his client's wishes. More decision of opinion, and more determinateness in action in enforcing professional duties, are the only conditions upon which the public will retain their confidence in the profession.

NEWINGTON PUBLIC LIBRARY COMPETITION.

THE Newington Library Commissioners have received six designs for their proposed public library to be erected adjoining the Vestry Hall in Walworth-road, the drawings for which are now on view at the Hall. Mr. Rowland Plumbe, F.R.I.B.A., was appointed assessor, and has awarded the first premium of £75 to No. 3, by Mr. E. B. I'Anson, of Laurence Pountney Hill; the second premium of £40 to No. 2, by Mr. Sidney R. J. Smith; and the third premium to No. 6, by Mr. John Bull, of Craven-street. The first premiated design, by Mr. E. B. I'Anson, represents the lending library, which is in most general request, in the front, on the left side of the entrance corridor. The latter is placed on the southern side, with the boys' reading-room, a narrow apartment between it and the southern boundary. Opposite the boys' room and in a central position on the other side is the borrowers' lobby, a square space taken out of the lending library, which occupies an area of 56ft. by 27ft. This central space is rather badly lighted; the glazed partitions will not much contribute to the lighting; and, although there are two good skylights over the front part of the library, and a window lighted from an area behind, the portion where light is essential does not derive much light from them. Over the whole area of lending library, except the front portion, the reference library is placed on the upper floor. Continuing our remarks on the ground floor, the main corridor leads to the news-room, running transversely, at a slight angle in the rear, a long apartment 66ft. by 23ft. A librarian's office is got between the lending library and news-room, lighted by a small side area on the north side, and the main staircase and staff stairs are well located at the end of corridor. One advantage of the plan is that the lending library can be closed, or separated from the other departments if necessary—a point that does not seem so absolutely desirable as the assessor has made it, though the requirements in this instance may make it essential. The boys' room is also under the supervision of the staff, being just opposite the borrowers' lobby. The author shows his magazine-room above, which is rather objectionable, though it is well approached from stairs. The reference library forms the front first-story room, and is placed transversely, 51ft. 6in. by 31ft., with two centre bay windows, with bookcases arranged to form alcoves. The librarian's staircase and counter are well placed. A gallery is shown round the reference library which is 20ft. in height, the other departments being 15ft. high. The second floor has the librarian's rooms, and the third floor the attics. The elevations are poor; the façade has a crowded effect in the fenestration; the centre is pronounced by a flatly-treated ornamental gable, and the projecting lower story, covered by a flat, is hardly satisfactory. The side elevation next vestry hall presents a rather meagre appearance; the gabled blank wall is relieved by pilasters. Red brick and stone are used. The heating is by hot-water radiators. The assessor thinks the design can be erected for the sum named. A perspective drawing is sent in, but it does not show the setting back of the building.

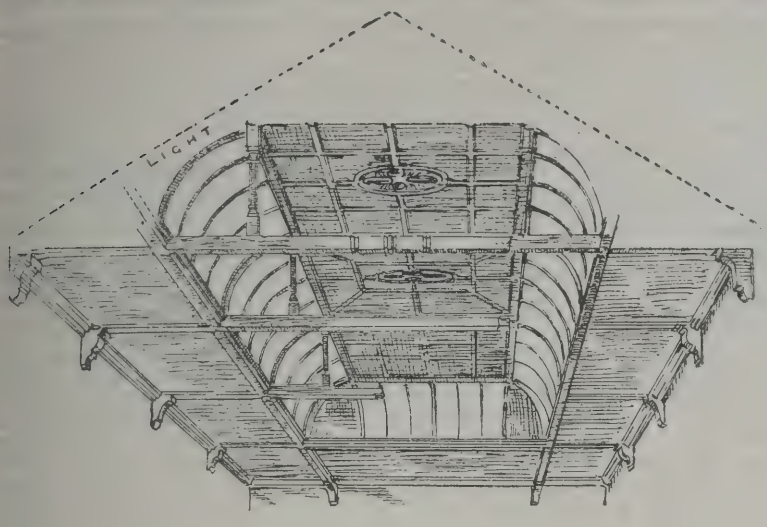
Mr. Sidney Smith's design is well planned as a whole. The lending library, 40ft. by 37ft. 6in., is in front on the left side of a wide entrance lobby, which is located on the south side. Next it in the centre comes the news-room, 40ft. by 37ft., mainly lighted by a skylight on the south side; and in the rear, forming a transverse block, are the magazine-room and boys' room, 43ft. by 23ft. 6in. All these departments are well approached and lighted; the side hall and corridor are of good width. The areas are given. A glazed partition is shown between lending library and news-room. The staircase arrangement is spoilt by its right-angle turn. The upper plan shows the reference library (with gallery) placed along the north side of boundary, 60ft. by 25ft., the south outer wall being carried by girder and columns over the news-room, and a large skylight obtained by this means on the south side for lighting the latter. The magazine block is low-roofed, and has a long, ridge skylight. The librarian's room is over the entrance hall. A well-drawn section and sheet of details of the fittings are sent. The least satisfactory part of the design is the elevation, shown by a clever ink sketch, which represents a brick building relieved by stone. There is a gabled end to the front on the north side, the windows look small, and the treatment is too domestic in character.

The third design, No. 6, has a more architectural arrangement of plan than either those named. Mr. Bull shows a good side entrance on the south side; a magazine-room, 38ft. by 26ft., in front, separated by a glazed partition from a lending library, 39ft. 3in. by 38ft. 4in., in the centre; with a lobby for borrowers the whole length; a boys' room with bay window, lighted on the north; and, lastly, a news-room, 66ft. by 23ft. The space for borrowers in this plan is spacious, and the counter well shaped; but being a passage-room to the boys' and news-room behind, the assessor has disqualified this plan from taking a higher place. A more cogent objection to it is the lighting of lending library, which appears inadequate, by the expedient to obtain light above the ground-story flat. The elevation, in a Renaissance style, with high curb roof and centre gable, has large windows. The centre has a flat bay to reference library under an arched recess; the front is relieved by stone pilasters and dressings in red brick. A bold perspective is sent.

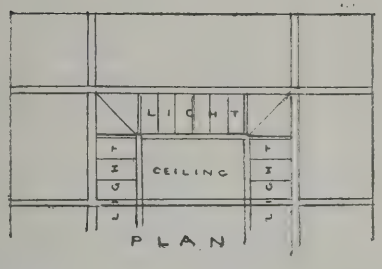
One of the cleverest elevations is that of No. 4, by Mr. Ernest Runtz, shown by a pencil perspective in a freely-treated Renaissance, with some Flemish characteristics. The entrance on the north side is pronounced by a cupola over the vestibule of ground story, and the angle of main building has an octagon turret crowned by a spirelet. The ground-story windows of magazine-room, which is in front 38ft. by 25ft., is lighted by mullioned windows of Gothic character, with ogee heads, and the upper stories have windows of Flemish Gothic design, wide square heads, with recessed panelling between the stories; the mullions continued through the two openings. A high roof crowns the building. The lending library is made the centre room, 52ft. 6in. by 30ft. There is no partition to shut off the corridor from it, which therefore makes it a passage to the boys' and news-rooms behind. We do not like the arrangement of counter in lending library, nor the staff stairs, which is open to the library on one side, and the general plan is not cleverly worked out. A gallery is shown round lending library. The librarian's rooms are in the rear on first floor. On the first floor over lending library is the reading room with a galleried reference library above. The sections and details of front of bookcases are carefully drawn. Radiators are shown along the walls. The north flank side next vestry hall is cleverly treated by panelling, and the building stepped to obtain the angle of light to rear premises.

No. 5, by Mr. Frederick H. Powell, of Kennington, has entrance at north end of front with boys' and librarian's rooms in front, a lending library 40ft. by 38ft. in centre, with borrowers' lobby independent of corridor, and behind a news and magazine-room side by side, these being roofed low with skylights. The lending library is poorly lighted, partly by a skylight over east end, and by a small court; it is also small in superficial are The reference library above the lendi library is placed transversely; a file-room obtained in the rear on south side. T elevation, in brick and stone, has Renaissar features, two gables with corner octagon b terminated at roof-level by a cupola. V do not like the square ground-story window those of first floor look meagre. Had t author studied the sizes of the rooms r quired, this plan would have stood better the competition.

One set of designs, those by Mr. E Marsland (No. 1), has been removed fr the walls—we understand because they disqualified by the assessor for some mer technical non-observance of conditions, a therefore we have not the opportunity comparing them with the others. T course is unjust, at least to that gentlem to other competitors, and to the public. M Marsland places his lending library behi the news and magazine-rooms. His desi has been rejected, as we hear, on pur technical grounds—that he had not suppl a perspective, and ½in. scale drawings fittings, and that he had not observed angle of the side light on the south si These are surely insufficient reasons removing the drawings, and apprising public by a printed notice of such remov and we can only justify the proceeding believing that the Commissioners w ignorant of the usual course genera followed, and were not actuated by a other motive. We may mention that angles of light in the rear and at the s were conditions of the competition, and t no windows at the side of library facing vestry hall should be introduced. Th conditions have not been favourable t pleasing grouping of the departments. No for instance, has a very awkward piling of several stories in the centre, owing to necessity of observing the angle of lig The back buildings have, for this reas been kept only one story high. The Bui ing Act regulation also, which requires building line to be set back in front towa Walworth-road, has imposed the neces of having only a one-story front ro covered by a flat—a condition certai which is difficult to deal with architectura and only one author has treated this in artistic manner. We may add that outlay contemplated is not to exceed £7,



FREE PUBLIC LIBRARIES—XVI



ROOFS AND SKYLIGHTS.

CONTINUING our remarks on the t lighting of news and reading-roo we promised to show a few arrangement hipped skylights. We may observe th are two methods of construction: one of th is to make the skylight the outer roof—t is, the bars become as it were the act rafters with glazing between, as in an ord ary outer skylight; the other method is construct an outer roof with lights, as as an inner ceiling—that is to say, there i outer and an inner set of lights. There certainly some advantages in having outer roof and an inner ceiling; the war of the room is better retained in winter, the sun is less piercing than it woul under a glazed roof as the only cover Of course in the latter kind of r such as we illustrated on page *ante*, outer or inner sun-blinds necessary in hot summer weather, during cold weather an unpleasant condes tion might be experienced, besides a ra conduction of the heat of the room, wh would necessitate increase of heating pow

DOUBLE ROOFS.

On these grounds we should always pr a double roof having the outer cove separated by a space from the ceiling. have shown several kinds of roof of

l, and we now give a sketch of one of the forms of roof and ceiling. The simplest n would be an ordinary king-post ceiled below the tie-beam with flat ng lights let in an intervals between the cipals, the ceiling joists being trimmed that purpose, with rough skylights out- . But a little extra material and ur would suffice to make an open and dsome roof internally by substituting ueens" for "king-post" and struts, oducing a collar or straining-piece veen the queen-posts at the top, and ning coved lights springing from the tie- n as shown in sketch. In this case exposed timbers would be wrought and lded, or chamfered. The flat, upper ng under collar could be either plastered eiled in wood and relieved by panels, the e treatment being adopted in the soffits lat portion on each side between the ved lights and the wall. There would s be an air-space left between the outer and the inner lights, and also below the e, which would enable a more equal perature to be retained in the room.

TREATMENT OF CEILING.

Hardly less important is the appearance of ceiling internally. Additional height is en to the room by this form of roof of 4ft. or at least—a valuable consideration when height of a story is limited, and certainly itting of better ventilating arrangements carrying up a shaft with an air-pump tilator above the ridge. By planing the beam and queen-post, and chamfering grooving them to form anulets, as cated in our sketch, an architectural sh may be given to the timbering. The t effective plan is to expose the lower ions of the tie-beam between the level ing or the boarded portions, by which ns the flat surfaces are broken into els and can be subdivided by smaller ribs lesired. The whole of the timbers can be ated appropriate shades of colour or be stained and varnished. The curved ribs ning the glazed coves should be moulded rnally, and a wider rib placed at each cipal rafter, also at lesser intervals veen the bays. The glass would have to be made expressly to the curve, and may be of ornamental kind with patterns impressed or "chequered" on it, or the patterns produced by brilliant cutting on obscured surface, or coloured or stained glass might be used if the lighting allowed of it.

RAISED LANTERN ROOFS.

Another variety of open roof of similar framed construction is in having a raised lantern in the centre above the collar level, the queen-posts in which case are continued above the roof, and are framed into a separate span roof above the lower roof. Between these uprights and rafters glazed lights are introduced. In this case, the lower coves are ceiled, or are divided by ribs into panels. Very pleasing decorative ceilings of this class are to be found over many of the recent libraries, and there is a good example over the lending library of Derby Library and Museum. We will give a few other examples in our next article. No doubt more direct light is admitted by the lantern; but this type of open roof has less to commend it than the internal light arrangement we have shown.

THE ARCHITECTURAL ASSOCIATION.

THE inaugural meeting of the new session of the Association was held on Friday evening at 9, Conduit-street, W., and was largely attended. The President, Mr. Frank J. Baggallay, occupied the chair. The report and balance-sheet for last session were adopted, without discussion, on the motion of Mr. Hampden W. Pratt and Mr. Leonard Stokes, ex-president. A long list of donations towards carrying out the new Educational Scheme was read by Mr. E. S. Gale, hon. sec., and also a list of donations to the library, and a vote of thanks to the various donors was proposed from the chair and carried by acclamation. Messrs. R. A. Jack, W. G. Watkins, and P. J. Hanson were elected as members, and 57 nominations for membership were read, the announcement of the number at the close of the reading of the long list being greeted with hearty applause. The President stated that under the new constitution any member of the committee who should accept a paid office must retire, but would be eligible for re-election. In accordance with that rule, Mr. F. W. Farrow, the senior vice-president, had ceased to hold that office, having been appointed a lecturer. At the next ordinary meeting the committee would nominate a member to fill the vacancy.

The President having distributed the prizes for the past session in accordance with the list published in our issue of the 9th inst., p. 499, proceeded to deliver his

INAUGURAL ADDRESS.

In his opening remarks Mr. Baggallay referred to the changes that have been made in the character and aims of the Association, pointing out that the four central ideas have been—first, to substitute a series of classes arranged on a comprehensive systems, for the old classes all independent of one another, with a view to conducting students through a regular course; secondly, to substitute a single responsible teacher or lecturer in most cases for a group of voluntary instructors, with a view to making the instruction more consistent, consecutive, and effective; thirdly, to fill up gaps and make the course complete; and, fourthly, to provide a place in which students could make their drawings and designs under the superintendence of competent instructors, with the advantage of their advice while at work, instead of only hearing their criticisms when it was completed. With these objects in view, the regular curriculum of study has been drawn up, and lecturers and instructors have been appointed to the various classes. It is almost unnecessary to add, continued the President, that, in many cases, the task has been undertaken out of pure goodwill to the Association, or to the cause of architectural education. To afford the accommodation for drawing and designing, and also to provide proper classrooms, new premises at No. 56, Great Marlborough-street have been rented, where a library and reading-room, two classrooms, and two studios have been fitted up. The increase in the secretarial work of the Association, involved by these fresh arrangements, has necessitated the appointment of an assistant secretary at a salary. The fees to be paid by students are, of course, large as compared with the old nominal class fees; but from all other points of view they must be acknowledged to be exceedingly moderate. At the same time, it is calculated that all expenses for instruction, and the increase in rent and other expenses involved by the change, will be paid by these fees if twenty-five fresh members take up the course each year, and pass steadily through the four years, or if there is an equivalent attendance in other ways. These arrangements, although they leave many important branches of our work untouched, a circumstance which has sometimes been overlooked, represent a revolution in our system of education, which must always remain our chief object. Those who have watched closely the position and work of the Association, and the advance of architectural education in recent years, cannot but have observed the gradual approach of the time when some such change would be absolutely necessary, unless, indeed, we should be satisfied to sink into insignificance, or become a mere social body. Our classes had become too numerous, and some of them too unwieldy to be managed in the old way, and the technical training of architects had become too serious a matter to be undertaken in other than a serious spirit and systematic manner. This has now been effected with the sanction of the general body of members, and, whether for good or ill, we are launched upon a course which most of us believe is destined to lead the Association into a position of influence and usefulness very far in advance of even that which it has hitherto occupied, but which may prove at the outset one of some danger and difficulty. It is not easy for me to indicate precisely where the danger or difficulty may appear, nor do I wish to anticipate anything of the sort. But when we think of how small a reserve of funds—notwithstanding the generosity of our friends—the Association has to fall back upon, it is impossible to feel that we are safe in that direction. Then, again, it would be strange also if all the arrangements for the future, made with immense labour and anxious care, but still under pressure of time and necessity, and without the data which experience alone will provide, were found to be faultless, or to work in every respect perfectly satisfactorily. Again, it would be almost as strange if such changes as have been effected had been brought about entirely

without injury to some individual interests, for any considerable reform in an old-established society must, almost inevitably, at the moment, produce a small crop of grievances. The fact that the curriculum course extends over four years has been much criticised, as too long or too short a period; but consideration of the differences in ages and qualification existing among those who will probably avail themselves of it will show that there are sufficient grounds for the arrangement made. We cannot expect that all who take up the course in the first, or any year, will go through all the subsequent years. We must be prepared always to find a rather larger number of students working in the earlier years than in the later ones, just as hitherto our elementary classes have always been the better attended. We may, however, fairly expect that a considerable number, probably a large majority, of members will see the advantage of working steadily through the four years' course. The number of students who have taken up the course, or parts of it, already is quite as large as one could reasonably have expected to begin with, and the number increases every day. By far the largest number (43) have entered as "first year" students, while 19 have entered for the second, and 18 for the third session. If most of these work steadily through the four years' course, and if about the same number enter each October, there can be no doubt whatever that in the estimated three years' time, or even sooner, the full number expected will be reached. Judging by the attendances up to the present time, the studio appears to be a very popular part of the new arrangements. Another most encouraging circumstance is that, in many cases, the fees appear to be paid by the principals for their pupils. Perhaps the greatest encouragement we have received is from the fact that the Institute of British Architects has passed a resolution pledging itself to afford us pecuniary assistance, and instructing its council to consider and decide in what manner and to what extent such assistance shall be given. The premises which we have been so fortunate as to secure, though a little small, are in all other respects admirably suited to our purposes. Funds are still much needed to meet the heavy initial expenses, and the deficit on account of the classes which there must be this year, and which there will probably be for one or two years to come. Notwithstanding the generous donations we have received, the £2,000 we asked for has not yet been half subscribed, and we cannot rest content without the full amount. A much larger sum, which could be treated as capital or as reserve, is indeed needed before the Association can consider itself in a perfectly secure and satisfactory financial position. But pressing as the financial question is, it is not so pressing that it should exclude from our minds the grave responsibility we have assumed towards those who will intrust their technical training to us, and, indeed, towards the whole of the architectural profession. Although we have from the first held classes, and have for some years given lectures, and done a good deal of serious teaching, we have never before professed to do the greater part of it in other than a semi-amateur way, and have never pretended that the Association course was anything like a full or sufficient complement to the practical training of office work. Indeed, private study, especially in certain directions, will be as necessary as ever; but as regards such technical training as lectures and classes can give, students and the profession will now have a right to expect our course to be complete and efficient. We cannot justly refuse to accept this responsibility, or to strive earnestly to fulfil the duties of the position we have assumed, by making our teaching as complete and as efficient as the most strenuous efforts and most watchful care on our part can make it. Architectural education has been the subject of much that has been said and written in recent years, and there are almost as many opinions as there are writers and speakers. The theories recently published need not trouble our minds very much, or cause us to hesitate in what we are doing, even if it does not fall in exactly with any of them. The fact that apprenticeship has an immensely strong hold upon the profession, and that, notwithstanding its many abuses, it is, on the whole, a good system, with many advantages, makes all talk of superseding it useless for the present; but it is beyond a doubt that apprenticeship is not, as regards architecture, so all-sufficing in the latter half of the nineteenth century as it once was, and that there is a real and urgent call for something in addition. On this ground the Association has always taken its stand, and does so still; we aim no blow at pupilage, but we desire to provide means whereby the necessary knowledge and training, not to be obtained in the course of office work, may be accessible to those who join us. Among these means, classes and lectures, and our newly instituted drawing and designing school or studio, are not the only ones, although they are, perhaps, the most important. The President having referred in detail to the library, now the largest and the most nearly complete architectural lending library in the kingdom, to the system of visiting works in progress, to the annual excursion, to the Sketch Book, and to the fortnightly meetings, as auxiliaries of no slight value, and reverted to the classes, suggesting that as soon as opportunity permitted a little workshop practice should be added to the curriculum. The bringing up of an architect as a craftsman, which some now advocated, involved the risk of narrowing the thoughts and ambitions of students, and of further exaggerating the faults which were already too apparent in architecture—the sacrifice of breadth and largeness of conception to mere littlenesses and prettinesses. For all that, he would suggest that some day they ought to give students the opportunity of a little workshop practice, say, at least, in joinery and metal-work, not with any idea of making them skilled mechanics, but to show them, in the most practical way, how wood and various metals can be dealt with. At present there were no time, no accommodation, and no money for this branch. As regards day classes, the President added, they have not been forgotten; but the practical difficulties in the way have led to their omission from our present programme. Meanwhile the studio, as a beginning, is to be open all day, and some few students have already intimated their intention to use it, either every day, or on certain days in the week. Besides the financial help already promised, there are two ways in which the Institute might possibly be able to assist us very materially at the present moment to make our new classes useful and popular. The first is this: I do not know if there is any especial reason for holding the Institute examinations in March or November; but it would be a great advantage if the date of one or both examinations could be altered so that one should fall in June, after the conclusion of our course. The other way in which the Institute could help us would be by a declaration that up to and including the first qualifying examination for the Associateship after the end of May, 1893, candidates for that examination would not be required to have passed the intermediate examination. I should fail in my duty to those of you who are on the threshold of the architectural profession if I failed to repeat the warning so often given on these occasions, by asking each of you to consider well before you go too far, and to turn back, if necessary, before it is too late. Architecture as a profession has far more attraction for the romantic ambitions of youth than for the soberer sense of middle age. I ask you to remember this, and to make allowances to yourself for it, before you finally decide upon going forward. If you have the artist's love for art or his pride in the creations of his own imagination, and, to gratify this feeling, are satisfied to lead a life of self-denial, of incessant labour and worry, and disappointment, you will, if moderately successful, find the life of an architect not only bearable but happy. But if you wish for fortune or for public fame, believe me, you can win neither among us. If you are determined to go forward, remember the saying of the Hebrew King: "Whatsoever thy hand findeth to do, do it with thy might." Do not trouble yourself with unnecessary conundrums as to whether architecture is an art or a profession. Do not dub yourself either an "artistic man" or a "practical man"; but be satisfied to be merely an architect, armed at all points, able to devise a building beautiful to the eye and adapted in all ways to the purpose for which it is required, and equally able to get that building erected without its costing more, or taking longer to build, than it should do. Before you can do all this you have years of hard study before you. You have your eye, your mind, and even your hand to train. You have a number of facts to assimilate and certain habits to form, without which you would almost certainly get into difficulties that wo overwhelm you. Begin by devoting considera time to learning to draw well and rapidly, not o with the aid of a drawing board and T-squa but especially without any other aid than a pi of paper and a pencil. Until you have obtai the mastery of your pencil you will find seve of the most delightful and useful avenues study closed to you. At the same time, for drawing is only a means to an end, and not end itself. Meanwhile, cultivate your sense the beautiful by as frequent a contemplation beautiful objects—especially architectural obj —as you can compass. Strive to stimulate y inventive faculties and your powers of refl tion and original thought by setting your problems, and endeavouring earnestly to find true solutions of them. Do not neglect to st your mind with all facts which may be of us you. Visit buildings in progress and worksh whenever you can, watch the men, examine materials, question the foreman, ascertain usual way of doing certain things, a if possible, why they are so done, take all opportunities of comparing drawings and the specifications of a building w the work on the spot, in order that you may better understand the connection between actual work and the representation and desc tion of it. Make yourself acquainted, too, w the business of the office in which you engaged, and with the manner of conductin Finally, do not fail to test your progress means of the Institute examinations. If yo all this you will, in a few years, become a c petent architect's assistant; and if you perse in the same course for a few years more, you then venture to undertake any little work your own account with which you can get a one to intrust you; but do not be in a hurr practise for yourself, for many a man has ru his prospects by this fatal step. While stri to perfect yourself as an architect, do not, as value your peace of mind, your reputation, even your success, neglect your character man; cultivate courage and energy, pe verence and patience, and keep in mind the quoted advice of the late Professor Cockere be "an artist among gentlemen, and a ger man among artists." In conclusion, if would reap the full benefit of your member of the Association, identify yourself with work, and be ready to exercise a little self-de for the general good. This is the spirit w has animated the Architectural Associatio the past, and this is the spirit which must mate it still. If you act in this spirit, you never regret it, but will rather consider honour and pleasure of having helped in su work so great that you will say what I say from my heart—namely, "I owe more to Architectural Association than I can ever to repay."

Mr. MacVicar Anderson, P.R.I.B.A., posed a vote of thanks to the President for able and interesting address. The great pro that had been made in late years by architec education was largely due to the self-sacrifi efforts and energy characteristic of the men of the Association. They had now entered new departure. Some had criticised the c culum as very wide and diffuse; but those did so forgot what an architect really was. was a sort of hybrid animal, an artist, scie and man of business at the same time, and h his education must be wide and diffuse i nature. The advice given by the President admirable, and the only point to whic ventured to take exception was his warning as a profession, architecture had far mor tractions for the romantic ambitions of y than for the soberer sense of middle age. thought Mr. Baggallay was scarcely, as yet, petent to judge on this matter; but, speaki one who had reached maturer years, he assure him that he had not found the profe less attractive. Nor could he agree with President that there were not many within the reach of architects. As to the dent's suggestions of ways in which the Inst could help the Association, Mr. Baggallay member of the Council of the Institute, w receive an attentive hearing if he would his proposals before them. The functions o Association and Institute were different, th being largely a teaching, the other an exam body; but their united efforts could not fa considerably elevate the status and dignity o profession.

INTENDENCIA, VALPARAISO.

A PRIVATE RESIDENCE, BUENOS AYRES.

STATUE OF GENERAL O'HIGGINS.

SKETCHES FROM CHILI.

Professor KERR seconded the vote of thanks, marking that the address had been able, oquent, and useful in character. It was very markable that the work which had been, and s being, done by the Association should be complished by the students themselves; he ew of no other instance of a successful endea- ur of the kind. The reflection occurred what s to become of all the 1,200 young members the Association; was there room for all of em as architects? His theory was there was t; but that many would drift off, not into the nks of the painters in oil or water-colours, but ther into the subsidiary and auxiliary arts, here he believed their training and education uld enable them to execute work far in advance the ordinary designer of the furniture and holsterer's shop.

Mr. ASTON WEBB said his inspection of the assrooms and studio at Marlborough-street gave e impression that the rooms and appliances ere excellently adapted to their purpose. His perience had been that where principals paid e pupils' fees less interest was taken in the asses than when the youths themselves found e money.

Mr. LEONARD STOKES put to the meeting the otion, which was carried by acclamation, and e PRESIDENT briefly responded.

SKETCHES FROM CHILI.

WE published a few weeks ago* several drawings of some modern buildings ected in the Argentine Republic, and to-day, contrast with these illustrations, we give some etches, from the able pen of Mr. George C. orant, which show a few typical specimens of e more historic architecture of South America.

* BUILDING NEWS, Oct. 2nd, 1891.

Mr. Morant's knowledge of Spanish, and long acquaintance with the subject of his book,* inspire at once a confidence as to the accuracy of his concise and graphic accounts of the towns and villages visited and described. After touching Lisbon, and passing some places on the coast of Brazil, the traveller was unable to embark at Rio de Janeiro on account of an outbreak of yellow fever there. Having thus avoided the perils of the plague, the delay of quarantine, and escaped the penalties of the lazaretto at Flores Island (the quarantine station at Monte Video), later on the River Plate was reached, and a start made for Buenos Ayres. Here interminable delays, occasioned by the Customs authorities, and the safeguards so rigidly taken to prevent risk of infections, formed the subject of a series of experiences which made an exceedingly bad ending to an otherwise enjoyable voyage. The majority of houses in Buenos Ayres consist of the ground floor only, and more particularly is this the case in the outskirts, although towards the heart of the city many buildings are to be found with upper floors. The increase in the value of the central sites of the town will, no doubt, before long lead to loftier buildings being put up. These dwellings are of the old Spanish type, with an extensive *patio*, or inner courtyard, thus covering individually a considerable space of ground, and collectively forming a city of vast extent as compared with the population. The hotels, the *casas amuebladas* (furnished houses), and restaurants are all described by Mr. Morant, who does not seem to have been greatly impressed by the *plazas* (open squares), or with the cathedral in "Plaza Victoria," a plain building without any special features. The banking houses of the town are the best buildings, and often, it seems from all accounts, are more substantial in their fabrics than the money reserves which they contain. The sketch which we print shows a typical residence of the better class. La Plata is pre-eminent for its public buildings, and before leaving Buenos Ayres our author did well to pay the capital of the province a visit. The beautiful gardens there are adorned with statuary and handsome trees. Forming the great square are the courts of justice, the Government House, Public Library, Police offices, the National Bank and the great Opera House standing in several acres of ground. The whole of these works seem to have been conceived in anticipation of increased requirements, and thus, strictly in accordance with Argentine principles, enormous liabilities were incurred in their erection, without considering from whence ultimate payments were to be obtained. Not being able here to follow the writer over the "camp," by which term the vast pampas or prairies of the Argentine Republic are known, we will pass on briefly to the further subjects of his pencil. Rosario is essentially a dull and uninteresting place, although English is as much spoken there as any other language, and the town is the head-quarters of the Central Argentine Railway. South America, however, is altogether unsuited to British emigrants. The towns are already filled with young men who have learned no handicraft. No occupation as clerks is open to them, and consequently menial labour of any kind has to be resorted to. The "camp" is only suited to those capable of the roughest kind of work, and who have no objection to associate with Indians of the lowest types. The advice given by Mr. Morant to those thinking of emigrating to the River Plate is, "Don't." Argentine finances are beyond our scope; but we have read with interest the descriptions here given of Valparaiso and Santiago. The Intendencia at Valparaiso forms the subject of the second illustration, and the third is of a statue to General O'Higgins, about which no informa-

* Chili and the River Plate in 1891. By CHARLES C. MORANT. London: Waterlow and Sons, Limited.

tion is afforded. Lima Cathedral forms the last subject of our illustrations. Mr. Morant says of it: "The world-renowned cathedral has a particularly shabby appearance both inside and out, and the iron crosses on its towers being much out of the perpendicular, the general effect is not a favourable one." The interior is adorned with hideous and tawdry figures carved in wood and painted in gaudy colours. Some are covered with tinsel and cut paper ornaments. Thus bedecked they match the threadbare altar coverings over glazed calico frontals. The head of the Saviour bearing His cross was provided with hair of dyed tow, which hung over the face and was plentifully decorated with "yellow marguerites"! The hospital at Lima is a good building, and the town is set out on the old Spanish block system.

PRICES.—XX.*

(All Prices Include Profit).

CARPENTER (*continued*).

		£	s.	d.
Wainscot Oak (continued)—				
2in. rough, including waste	per foot super.	0	2	3

2 by 3 ditto ditto	ditto	0	1	2

American Walnut.

Price this at the same as wainscot oak; the labour also is about the same.

In either of the hard woods already given, exceptional wood must be paid for at a higher rate, and in all cases boards beyond 12in. to 15in. wide are of extra value; beyond 24in. and in long lengths the wood gets scarce.

A good deal of American walnut now imported is small and sappy, and the cut stuff unfit for any good work.

The weight of hard woods must be borne in mind in estimating the cartage from docks to mills and back to the shops.

Take all labours not given, at twice those in deal, for Honduras mahogany, three times for Spanish mahogany, and twice for wainscot oak.

STAIRCASES.

HOT-WATER ENGINEERING.—XIX.

Supply of Hot Water for Baths and Domestic Purposes.

Sources of Danger — Faults and Remedies.

THE possible causes of explosions are limited to four—viz., frost, failure of water, stop-cocks, and incrustation. These are placed in their order of precedence. In the ordinary way we may consider an apparatus as being perfectly safe without a safety-valve, for so long as either the expansion-pipe or the cold-supply service remains open, an explosion cannot occur. In the usual way, of course, both these pipes are open; but if by any means one of them became closed, only inconvenience, and no danger, need be feared. Taking all things into consideration, however, it is a little surprising that more calamities do not occur, and undoubtedly there are frequent occasions that the range fire is lighted at a time that it is positively suicidal to do so, but fortunately there are many little things transpire to prevent an accident, even when everything is favourable for one to occur.

Speaking of frost, which is the most general cause of these disasters, it is necessary for the water to be frozen hard in both cold supply and expansion pipes, or if it is the tank system, the primary flow and return may be frozen also. With these pipes closed, a rupture must occur at the boiler (supposing no safety valve exists) when sufficient heat and subsequent pressure is developed. This pressure has to be very great, for the boiler and pipes are of great strength, and on this account the explosion becomes so fatal if anyone be near. As just mentioned, a fire may often be lighted at times when it is highly dangerous to do so, and yet no accident occur. It may happen in this way: supposing a severe frost exists in the night, and some part of the pipes spoken of are situated in the roof, or a similarly exposed position. This, if the pipes are not protected in some way, will result in the water being frozen, if the frost is severe, about three or four o'clock in the morning. The fire may be lighted at six o'clock; but now may happen two or three things. Firstly, if the quantity of ice be moderate, the water, as it heats up, may melt it, for there would be no danger for about the first half-hour. Secondly, a servant might go to a tap for water, and this would have a two-fold effect: it would relieve the boiler, and at the same time show there was something wrong; and there are other little occurrences that go to obviate the impending trouble. During the past severe winter there must have been many very narrow escapes, and it is somewhat astonishing so very few accidents occurred, particularly as a new source of danger—shortness of water—was so prevalent. This tells us forcibly that exposed parts of an apparatus (particularly in roofs) should be well covered with some poor conductor of heat, and, as so strongly urged in a previous paper, every part of the apparatus should be covered to prevent loss of heat, as this not only helps to give immunity from danger, but is a real source of economy in fuel.

The next source of danger is shortness of water—a failure in the water supply from some cause. This trouble carries no danger with the cylinder system, as, supposing the apparatus to be properly constructed, the cylinder cannot be unknowingly emptied, and only inconvenience can result. Of course, if the lack of water continued for two or three days, and the fire was kept going all this time, the contents of the cylinder and boiler might be evaporated, that is to say, boiled away; but it is hardly likely that a fire would be kept going this length of time after it was known that no water could be drawn from the apparatus, and it is still less likely that the apparatus would be allowed to remain without a supply of water for this length of time.

It is in country places in particular that shortness of water occurs. At residences where the water is pumped daily, and this done by hand labour, it not unfrequently happens that the supply runs short unexpectedly, that is, the house cistern is exhausted either by reason of a greater demand or the pumping having been insufficient. The cylinder system ought to be insisted upon in such places.

The way in which an accident occurs from this cause is as follows:—Supposing it to be an apparatus upon the tank system, and the water fails, we may suppose that the contents of the apparatus be withdrawn down to a tap at a low point. This leaves the boiler and a few feet of pipe full of water. This quantity, being small, will boil furiously, and quickly be evaporated if a brisk fire is kept, and after the water disappears the boiler will become red-hot. This is the time that a genuine danger exists, for should some water be supplied to the cistern and flow down into the boiler, an explosion of a terrific nature, wholly due to steam, will instantly occur. The instant that water entered the red-hot boiler it would be just as immediately converted into steam, and the two pipes from the boiler, supposing them to be both clear (water would be coming down the return) would be totally insufficient to relieve the boiler of the enormous force so instantaneously generated. An instance of this nature came under the writer's experience, but fortunately for two servants who were standing by the range at the moment, the boiler had a safety-valve. But such was the nature of the force that the valve did not merely open, but the top cap was forced out and curled up like paper. This is a danger that really cannot occur with a properly-constructed cylinder apparatus.

The next cause of accidents that stands in the order of precedence is stop-cocks. These, however, are only elements of danger when in the primary services both flow and return. If we put a stop-cock in either one of these pipes, but not in the other, there should be no danger, but there would be some very alarming noises and results generally. Occasionally an engineer will recommend putting stop-cocks in the primary flow and return of an apparatus, either tank or cylinder, the gain being that the whole apparatus does not need to be emptied of water when the boiler is opened for any purpose, and further than this, if the apparatus is charged with hot water, it can be drawn from and used, notwithstanding that the fire is out and a man is at work at the boiler. These are advantages certainly, and sufficient to recommend the practice under discussion were it not for the real danger it introduces.

A plumber lost his life quite recently when testing a boiler after he had cleaned it; he, in this case, having omitted to open the stop-cocks that existed in the primary services, and which he had closed before commencing work. This accident occurred to a practical man; therefore, how much easier for it to happen to a servant, who might consciously or unconsciously trifle with the taps, if they were conveniently at hand. Notwithstanding any convenience attained by the use of stop-cocks in primary services, it is better to omit them; the risks are too great.

The last cause of accidents to be mentioned is incrustation. This is a possible cause; but not a probable one by any means, and it is doubtful if an explosion has ever been due to it. There have been thousands of boilers fractured by an accumulation of deposit matter from hard water, but this fracture occurs without dangerous force or violence.

An explosion from this cause would be due to both flow and return pipes becoming choked with hard deposited matter—"fur"; so that the pipes became stopped just as effectually as they could be with stop-cocks. It would be quite possible for this to occur, and particularly if pipes be carried across a flue where great heat is felt. In this case the pipes become choked very quickly. The reason that an accident is so unlikely is that, as soon as the pipes become partly choked, and long before danger need be feared, there are alarming and very disagreeable noises and vibrations experienced; and eventually (yet still before there is danger) they become unbearable, and a workman has to be called in to remedy the matter. When pipes are very badly furred the violence of the noises and vibrations is noticed over the whole of the residence, so that before an explosion could occur, the other experiences would nearly drive the people out of the building. These noises, &c., are due to the resistance offered to the steam when it endeavours to escape. Usually, it is the flow-pipe gets most badly furred, then the steam has to find a passage up the return, causing a great commotion.

Faults and Remedies.

It would be an almost impossible task to enumerate all the faults that are to be met with in these works. The number is really enormous, and the list gets added to daily. It only comes within the province of this paper to describe a few of those that can be most commonly met with.

That which the writer considers is of most frequent occurrence is the connecting of the secondary return into a low point in the cylinder. Only a few minutes before these words were written, the writer saw a cylinder of good quality standing on a railway platform, and this cylinder was fitted with flanges, as Fig. 66. The two flanges on the right were, no doubt, for the primary flow and return; the flange on top for the secondary flow; and the other two flanges, one on right near the bottom and one in the bottom, could not be for anything

else than the secondary return and cold supply. It would hardly matter which was used for either purpose, for both were practically in the bottom. To stand and look at that cylinder was to know that the apparatus it was intended for, whatever its size or wherever it might be, would never be more than a limited success, if it did not prove quite a failure. The only possible chance of its acting well

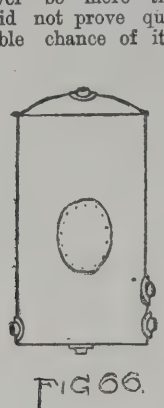

FIG 66.

would be if the works were carried out as described in Art XI.; but this could not have been intended, as one less flange would only be needed. It is unnecessary to repeat information given in previous papers, but let it be understood that, with the exception just mentioned, the secondary return must be be brought in near the top of the cylinder, as Fig. 67.

Another very prevalent fault is a boiler of

FIG.67.

insufficient power. With quite the majority of ranges the ordinary square-arched flue boiler is used, just the same as years ago when hot-water works were not nearly so extensive as now, and in a fair-sized residence it is now more often the case than not that a saddle boiler is insufficient for the work. As already mentioned, it frequently happens that a good boot boiler is incapable of doing the work, and an independent boiler is absolutely necessary. As hot-water works are getting more and more elaborate, it may probably happen that saddle boilers will soon be useless for all except cottage property: it is almost the case now.

An inefficient boiler is noticeable by its never yielding hot water in good time in the morning; but it can always be depended upon a little later in the day, supposing the fire is kept up. This is a regular result. Sometimes an irregular heating of the water is attributed to a poor boiler; but this cannot be, as should a boiler prove capable one day, it should be found equally capable always, as there is nothing to prevent its being regular in results except want of ordinary care in stoking and keeping the flue clear of ash. The latter is the common cause of uncertain results. The connection of the secondary return at a low point, just referred to, cannot be confounded with this second fault either, as its general peculiarity is for hot water to issue from the tap the first quarter or half-minute that it is opened, and then the issuing water becomes cooler, although the heat of the cylinder may indicate a plentiful store of very hot water.

A general fault, and which should perhaps have stood first, is exposed pipes. There are at this moment hundreds (possibly thousands) of works carried out, and which give but moderate results, yet which could be converted into highly successful undertakings, by being entirely covered with some poor heat-conducting material, and this would also effect an agreeable reduction in the quantity of fuel burnt. In the cylinder system it is the pipes above the cylinder that most need attention. The cylinder itself may profitably be covered, although it is usually in a warm position. With the tank system, the position of the tank itself generally leads to the greatest loss, for it is no uncommon thing for these to be placed in roofs adjacent to (sometimes touching) the cold water cistern, and quite often there is a clear way through beneath the eaves to the outer air. In this case, nothing but a very powerful boiler and an extravagant outlay in fuel will keep the water hot in severe weather. There is hardly a position in which a tank can be placed but what it becomes highly necessary that it be covered; the only exception is when it is placed in a close linen closet.

The last fault that there is space to discuss is that which causes noises in the pipes. These noises do not always proceed from the same cause. Usually noises occur in pipes that have been fixed some time, and they manifest themselves gradually, commencing in a very slight way, but in the course of time, either a few weeks, or it may be over a year, they become unbearable. When the noises are loud and alarming they are usually accompanied by vibrations that are felt at the most remote parts of the residence. These noises are due to fur, or incrusted deposit. It is always of gradual growth; but the speed at which the substance accumulates is governed by three things—viz., the hardness of the water, the quantity of water used, and whether the boiler is a powerful one. There is one other thing that governs the accumulation of deposit in pipes to some extent, and that is whether the boiler is cleaned out regularly or not.

There is only one remedy for this: when the noises are really bad, the portion of the service pipes which are furred must be taken out and renewed. It is, as a rule, the flow-pipe for a few feet from the boiler that will be found choked. The return-pipe is not generally in such bad condition.

When noises are heard in a quite new apparatus, they are generally due to air accumulation somewhere. It may be that the flow-pipe is dipped in the boiler, or (if the cylinder system) it may be the expansion pipe dipped in the cylinder, or, what is frequently met with, the flow-pipe descends to a trifling extent somewhere, so that it gets air-locked. Pipes should always be given a rise, however little, wherever possible. Horizontal pipes can be tolerated, but never actually approved of.

The most difficult cause of noises to discover is an obstacle in the pipes. When workmen use pipes each length should be looked through just before putting it up; but occasionally the workman introduces the obstacle himself by stopping up his pipe ends with a plug of hemp at night, and forgetting to take it out when proceeding in the morning. Quite commonly, when working on old pipes, the blows and rough usage disturb the inner coating of fur in the pipes, and when the apparatus is charged and used, this matter will collect at an elbow, and give a lot of trouble. It is almost a regular thing for taps to have to be taken out and cleared of this scale after pipes have been disturbed, as the flow of water towards the tap naturally carries this light matter with it.

The next article will deal with low-pressure boilers.

NOTES ON TERRACOTTA.*—III.

TREATMENT.

IN dealing with this article, it will be necessary to point out not only what should be sought after, but also what should be avoided. The architect who, when designing in brickwork, confines his details within the possibilities of brick sizes, although showing a knowledge of the material with which he is dealing and its adaptation, is necessarily reduced to an unpleasantly limited range of expression, so to speak. To obviate this, brick lumps, or preferably terracotta, the twin-sister of brickwork, should be introduced. When designing ornate features in brickwork alone, or in terracotta forming part of a brick treatment, the bond should first be set out, that is, drawn full size, and the features worked within a given range with due regard to the bond. Where this is not done, the bricklayer is often reduced to the undesirable expedient of building up blocks of an abnormal size by means of cementing and dowelling [illegible] or more bricks together, but more frequently the use of shellac and white-lead. Terracc blocks should be in height multiples o brick, and in length multiples of a br or a half-brick, so as to prevent, as far as pr ticable, any "broken bond" in the adjoin brickwork. All cornices and stringcourses, wh ending abruptly, should be formed with w stops.

These remarks apply to all projections, corbels, oriels, and other ornamentations, wh have often the appearance of being fixed u the façade rather than expressions of hur thought wrought out of the crude blocks. design, a free treatment appears best suited the employment of terracotta—the Pruden Assurance offices, for instance. Here absence of undercutting is fully compensated by the boldness and high relief of its orname producing the desired alternation of light shadow. Undercut work should be avoide much as possible in this material, and it will found upon a close examination of the work Mr. Waterhouse—that great master of mate and its treatment—that it is avoided, for ne all his raised ornaments are built up, as it were right angles to the blocks of which they form a p "As the furnace proveth the potter's vessel," is every block of terracotta proved in pas through the kiln. The sections should be that no long unbroken lines of square mem appear upon the completed building (the irre larities in round or convex members are apparent than in square members). The tinuity of line may be interrupted at s intervals by the use of annuletes or rusticati The voussoirs of arches of large span be treated in the same manner as a mean minimising the apparent irregularities of material. Of the mouldings of the exis orders and styles of architecture, those of Norman and the Classic lend themselves readily to reproduction in terracotta. T variously combined members, with little c undercutting, are adapted to this material, the deeply-cut and delicately-attached mem of the Early English are not so. The tend is, however, to depart from the verna mouldings, either by modifications of old sect or the introduction of new ones, producin class of buildings which not inaptly migh called terracotta designs, and which, perh will be looked upon at some future period as initial and progressive steps of the new depa in architecture shadowed forth by Professo Roger Smith in his recent opening lectur architecture at University College, London.

Architects are frequently appealed to to in mind the distinction between terracotta stone, and to treat it more from a brickwork of view than as a substitute for stone, obta the necessary bond by using alternate he and stretchers—i.e., Flemish bond, as a mea reducing the cost, lessening the time require production, and producing work truthful in line. To reduce terracotta to the pronou monotony of brick sizes is asking too muc by so doing the purpose for which it is so adapted—the working out of details not su for brick sizes—would be defeated. The mon of plain areas of ashlar work in this mate somewhat relieved by the introduction of occa narrow courses, an effect which the Greek Romans, in their love of order and unifor seem to have overlooked, as they design stones of uniform sizes. Terracotta is se its best in a free treatment forming part brick design; the brick sizes, acting as a f the larger yet necessarily small blocks of cotta. This is nowhere, perhaps, better e plified than in the St. Paul's Schools, West sington, where the dressings are of brigh terracotta, and the facings of deep, sombre well-burnt sand-faced bricks, with the emphasised, both in the terracotta and brickwork, by being struck and cut i manner known as "weather-jointing." of our recent buildings of the "new depar have noticeably suffered in the choice use of bricks intended to harmonise wit terracotta dressings. The selection of of a certain tone of colour is often made w due regard to their weathering capabilitie result being, in some instances, after a few exposure, that while the terracotta remain in the least affected, the brick facings are s be perishing and crumbling away. The practical man in any particular branch ha

* All rights reserved.

sult of special training and years of experience that particular branch, generally a rough-id-ready way of arriving at conclusions when idging of material, &c, which cannot often be oset by a more subtle method of induction. 7ith respect to bricks and terracotta, the method this:—Given a variety or number of red bricks terracottas to choose from (and I think we ight safely say any of the other known colours :cepting white), those which are at the same me the darkest and the heaviest of their kind ossess the best weathering properties. The :eater weight is, of course, due to the greater nsity of the clay, and the darker or deeper ne of colour to the oxide of iron present being nverted into peroxide in the process of firing, the ep red colour varying in shade according to e degree of heat in the kiln. Another ready ethod is to weigh the wares—whether bricks or rracotta—when perfectly dry, in air, and then ak them in water to the degree of saturation; ow weigh them again, and those which have sorbed the least weight of water are most rely to be the most enduring. Where density clay, deep-toned colour, and little or no sorption are found combined, we may rest sured that we have an almost imperishable aterial to build with.

(*To be continued.*)

THE HISTORY OF HAMPTON COURT PALACE.*

THE third and concluding volume of the interesting "History of Hampton Court," y Mr. Ernest Law, B.A., carries the arrative down from the expulsion of James II., rough the Orange and Guelph times, to the esent. We must refer our readers to our last otice of this work, which dealt with the cissitudes of the Palace during the ages of the udors and Stuarts. This last volume, just iblished, has some architectural interest, as it as during William and Mary's reign that the d Tudor state apartments were rebuilt from the signs of Sir Christopher Wren, and the park id out. The plans engraved assist the reader understand the demolition of the Tudor build-gs, and the rebuilding and additions made by Vren, which include the east front towards the reat Fountain Garden, 300ft. in length, and ie south front, 315ft., making two sides of the adrangle known as the Fountain Court, which nearly a square, the north and south sides of hich are 116ft. 10in. long, and the east and est sides 110ft. and 109ft. respectively. Vren has made the most of these east id south ranges by extending them beyond ie north and west ranges of the older palace. us giving his façades greater length. Evelyn, his "Diary," speaks of this rebuilding under ite 16th of July, 1689, which he saw in the rly stage of foundations. The great fountain garden on the east side, to which he refers as spacious gardens with fountains," was made om for by filling up the canal at this end. During is reign, also, the circular space before the east ont, where the great avenues converge, was id out as a fountain garden, though the idea of nnecting the avenues and planting the large micircle of lime trees was that of Charles II. seems probable that this great semicircle of me trees was extended further eastwards. An teresting incident is referred to touching the lling down of a wall, by which three or four en lost their lives, and an inquiry was insti-ted by the King, who desired that the Office of Vorks should examine into the matter, and that Vren should report to the Lord of the Treasury ereupon. There was a misgiving on the part f Wren as to the disinterestedness of the officials f the Board of Works. We read that the mptroller of the works and Wren could not gree as to the cause of the accident; an animated ene arose, an inspection of the defects by unpre-diced persons was ordered by the Lords, the result which was to confirm Wren's view, when it was dered that the works be proceeded with under Vren, as "surveyor," whose salary was only s. 10d. a day, while that of Talman, the comp-oller of the works, was 6s. 10d. a day. Wren's sk was not an easy one: he had to consult Villiam's taste in everything, and also to bring to harmony as far as possible the new Debased Renaissance of the day with the old Tudor Gothic. The great architect effected the combination with much skill by planning the new building round a court on the site of Henry VIII.'s Cloister Green Court, and in introducing red brick with stone dressings into the new buildings. The garden front of the Palace has much in it that resembles the palace built for Charles II. at Winchester, and now used as the barracks. The architraved windows on the first floor, the circular mezzanine openings below the main cornice, and the attic of square-shouldered windows above have a resemblance to the parade front of the latter edifice. The façade is massive rather than pleasing, and the level line of balustrades has a monotonous effect. No doubt William's taste approved of a style so much in vogue at the period. Mr. Law's remarks on the contrast between the picturesque irregularity of the old Tudor structure, with its gables, bay windows, turrets, and chimneys, and the uniform rectangularity of the elevations of the new portions are quite true; and what he says of the delightful difference of colour, the light pinks and purples of the old brickwork, compared with the monotonous brickwork of the new, is another reason why the older buildings are so much more pleasing. Dallaway's criticism, quoted in "Walpole's Anecdotes," is quite just as to the little repose for the eye. The colonnade of coupled columns in the Clock Court, which masks the Tudor building behind, is certainly a good feature, and there is something dignified in the elevations of the Fountain Court, with its arcaded and groined lower story, and the series of circular mezzanine windows on the second story. Grinling Gibbons was master carver, and his stone carvings here are certainly almost equal to anything he did in wood carving, as in the garlands and other devices round the circular windows of the quadrangle, the keystones of the arcades; the colonnade trophies of the Clock Court, &c. Gabriel Cibber also carved several coats of arms, statues, and figures, and the tympanum of the chief front, for which he recieved £400. The subject represents "The Triumph of Hercules over Envy," intended as a compliment to William. An excellent engraving is given of the handsome screens or gates of wrought iron, which formerly inclosed the gardens, designed by Jean Tijou, a French artist, who executed many other designs of iron-work for the Palace. We have little room to refer to the historical incidents recorded by Mr. Law. William's strong Protestant prejudices were very offensive to the English. "He set his face," we are told, "against any church music at all, and deeply offended the prejudice of English ecclesiastics by adhering to the Dutch custom of wearing his hat in chapel." His want of regard for the old home of our English kings and queens might have been even more ruthlessly shown if his contemplated idea of rebuilding other portions of the Palace had been carried into effect. Happily it was not. He showed no interest in, or reverence for, English traditions or antiquities; therefore we cannot be surprised that when Wolsey's Chapel, the "glorious gallery," and Holbein's fine frescoes were destroyed by fire with the Palace at Whitehall, through the carelessness of a Dutch washerwoman, he showed little concern or grief. It was indeed a national loss that Henry VIII.'s old State rooms at Hampton Court, with their internal features should have been destroyed, which, as Mr. Law observes, comprised the most interesting parts of the Palace. Queen Mary's private life, her love of needlework, her taste for Oriental and blue and white china or Delft ware, form an interesting chapter. The fitting and decoration of King William's apartments, and the estimate given by Wren for them, are fully described, and this and the following chapter will be read with interest. Wren's estimate in his own handwriting, dated 1699, and discovered in 1847, almost reduced to pulp, is still preserved in the Record Office, and is reproduced by the author. Many details of Gibbons's delicate carvings in lime-wood for the State apartments are given. The king's bedchamber has a very beautiful frieze of foliated scrollwork, also some choice paintings on the ceiling by Verrio, representing "Sleep," with figures of Endymion, Morpheus, Diana, and Somnus. The king's staircase is one of Verrio's largest works, and prompted the satire in Pope's lines. Queen Anne's connection with Hampton Court was not of long duration. An account is given of the undischarged debts of her workmen, and their difficulty of obtaining payment from the Treasury. George I.'s arrival, his "fat and ugly mistresses," nicknamed the "Elephant and Castle" and the "Maypole"; his unpopular regard for his German friends, are interesting incidents. During this reign it was that Sir Christopher Wren, after fifty years spent in the service of the Crown, was dismissed from his office, an act which, as Mr. Law says, was one of the "worst blots on a reign sufficiently blurred and bespattered." The great architect was of too noble a nature to cringe to the "crew of foreign parasites and mistresses who dispensed the royal patronage of the first George." William Benson, who succeeded Wren, was more compliant, and no doubt did not scruple to obtain the favour of his friends at Court by means which would have shocked his predecessor. The pretence of effecting economies was a disgraceful pretext; so were the abuses alleged by Benson and others of jobbery by the clerk of works. Benson was soon discredited, and his jobbery and incapacity to hold the office overtook him, for he was dismissed a year after his appointment as surveyor. Wren's protest against Benson's memorial alleging mismanagement of various kinds is given in full, and is dated 1719, from his residence at Hampton Court, and is a noble vindication of his conduct. George II.'s life at the Palace is interesting reading; during the next reign it was divided into private apartments. But we leave Mr. Law's interesting narrative here. The subsequent history and recent restorations are dwelt upon in detail. This third and last volume completes a work which depicts, by pen and illustration, English Court life and manners during a most eventful and brilliant period.

* The History of Hampton Court Palace, Vol. III. Illustrated by Engravings, Etchings, and Plans. By ERNEST LAW, B.A., Barrister-at-Law. London: Bell and Sons, York-street.

NEW TURKISH AND WARM BATHS AT WEST HARTLEPOOL.

PRACTICAL hygiene is certainly making headway in this country; theories, however good they may be, are simply a dead letter if not put into practice. It is a little over thirty years since the Turkish bath was reintroduced to us by David Urquhart; it has taken deep root, so that now nearly every town of any dimensions has one or more Turkish baths, and West Hartlepool has made an effort to be abreast of the times. Some months ago, a company was formed for the purpose of erecting new premises, and to provide baths to meet the pressing wants of the neighbourhood. The arrangement of the baths, the heating and ventilation of the Turkish bath, and the supplying and fitting of lounge baths was intrusted to Messrs. J. Constantine and Son, of Manchester—of the Convoluted Stove notoriety—with most satisfactory results, as the following will show:—

Hartlepools Bath Co., Limited,
Tower-street, West Hartlepool,
August 29, 1891.

To Messrs. J. Constantine and Son, Manchester.

GENTLEMEN,—Now that your portion of work in connection with the above company has been completed, I beg leave to say that everything has been carried out and left in a thorough and highly efficient manner, both in material and workmanship. 1st. The stove and boiler are perfection, and your stove fitters have given us the highest satisfaction for skill and workmanship. 2nd. Your plumbers and bath fitters have carried out their part of the work in a most excellent and skilful manner. I may say that I have never seen work so carried out and so perfectly complete. And I have had over twenty-three years experience in this work, and during that time have had five such places erected for me. When we went to test your plumbing work with the hot and cold water full on throughout the building, there was not a single joint in the whole place wanted redoing or even looking at—all was perfect—and it was very pleasing. We tested all the works—viz., stove, boiler, tanks, baths, douches, and all water arrangements last Thursday, and expressed to your foreman plumber that we were highly satisfied with everything.—Yours very obediently,

ROBERT SCOTT,
On behalf of the Hartlepools Bath Co., Limited.

The wall-surface of the hot rooms are all of white glazed bricks; the ceilings are finished with adamant and faced with "chromolith," enamelled faced; the floors are beautifully tiled, the lounge baths are porcelain, and everything finished in a complete and substantial manner.

The ceremony of unveiling a stone of dedication of the Manchester New College, Oxford, took place on Tuesday afternoon, when there was a large and representative gathering of Unitarians from all parts of the country. The buildings are situated at the back of Holywell, near Wadham New College. They will cost £55,000, and will be built from designs by Mr. Thomas Worthington, of Manchester.

HOSPITAL CONVALESCENT HOME.

This building is now in course of erection at Parkwood, about a mile from Swanley Junction, Kent, for the Trustees of the Hospital Convalescent Home. It will provide accommodation for 120 convalescent patients besides the requisite staff, the patients being received from some of the general hospitals in London, the selection of the particular hospitals to be thus benefited resting with the trustees. The cost of erecting and finishing the building, which will probably amount to about £40,000, will be defrayed out of the donations of Mr. Peter Reid, and an anonymous friend of his, who have contributed respectively £100,000 and £50,000 for the purpose of founding the Institution and maintaining it on a permanent basis. The building is three stories. The central and administrative block provides accommodation for committee, matron, undermatron, nurses, and medical officer. To the westward of this block is the men's wing, consisting of large and small day-rooms and smoking-rooms with verandahs. The east wing is similarly apportioned to the women, with three day-rooms and verandahs. In rear of each wing are ample cloak-rooms and lavatories. On the north of the central block is the large dining-hall, which has separate corridors leading from the men's and women's wings, and which is capable of seating 200 persons, so as to allow for future extension of the home. In the rear of this dining-hall are the kitchens, nurses' dining-room, and domestic offices, which are only one story. On the upper floors bedroom accommodation is provided, together with an ample supply of baths and lavatories. A separate staircase is provided to each block. The style of the building is Domestic, as it was the desire of the architect to give it an air of homeliness. It is faced with picked stock bricks, relieved with red brick and stone dressings, the upper part of the walls being covered with red hanging tiles. The roof is covered with Broseley tiles. The building is being erected according to the designs of Mr. E. B. I'Anson, architect, of 7A, Lawrence Pountney-hill, London, by Messrs. J. Shillitoe and Sons, the clerk of works being Mr. J. Langton. A chapel for the use of the inmates of the home is also in course of erection, from the design of Mr. I'Anson, at the expense of an anonymous benefactor. The drawing reproduced herewith was exhibited at the Royal Academy this year.

STALLS, ETC., IN CLUMBER CHURCH, NEAR WORKSOP, NOTTS.

These stalls, which were executed for his Grace the Duke of Newcastle, were made by Messrs. Cox, Sons, Buckley, and Co., of London and New York. They are carried out in walnut and cedar woods; the statues are carved in "linden" or lime wood. The crucifix or "rood" is of walnut, the figures of the rood are executed in cedar, and the candlesticks are of rose or "latten" metal. These works aim after representing the grace, delicacy, and power of the best Mediæval productions, the statues especially being carved with life and vigour. They present a striking contrast in these respects to the tame and lifeless figures on so many screens and retables lately erected. These stalls, &c., are due to the facile pencil of the Rev. Ernest Geldart, who was, we believe, a pupil of Mr. A. Waterhouse, R.A. Messrs. Bodley and Garner were the architects of the building. Another illustration of the church will be found in the Building News for Jan. 2 this year.

SCIENNES PUBLIC SCHOOL.

This school is in course of erection by the Edinburgh School Board. The infant department contains five classrooms, placed on the ground floor. The juvenile department contains eleven classrooms, placed on the ground and first floors. On the second, or upper floor, is provided a drawing classroom, a demonstration cookery classroom, a practical cookery classroom, and a science room. From the nature of the site, a basement floor has been obtained to the back, containing a gymnasium and a swimming-bath. The usual private rooms for teachers and cloak-rooms for the children are provided. The school is heated by hot-water pipes, fresh air is admitted through boxings, in which are placed coils of hot-water pipes, so that in winter the air is gently heated before entering the classrooms. The vitiated air is extracted by means of fans driven by a gas-engine. The school will accommodate 1,679 children, including the practical cookery room. The cost of the school, including furniture and fittings, will be about £21,000. The work has been carried out from plans prepared by Mr. Robert Wilson, the Board's architect.

DETAILS OF ENGLISH WOODWORK.

The examples of early 18th-century woodwork are from South Kensington Museum. The first, a door-head with elliptical arches, is a fine specimen of the carved work of the period. Much of it being in high relief, especially that to the frieze and spandrels. The fine heads in the latter are worthy of note. The pendants are also very good. It is unfortunate that some idea of the door-opening over which it was placed has not been preserved. It was taken from an old house in Westminster. The other example is officially described as a "Doorcase and Door—carved deal—from No. 18, Carey-street, Lincoln's Inn," and is also a fine piece of work. The carved swags of foliage, flowers, and fruit in the pediment are in high relief. The other carving to the mouldings and architrave is also of good design and well executed.

Sidney K. Greenslade.

EIGHTEENTH-CENTURY DOORHEADS FROM EXETER: R.I.B.A. TRAVELLING STUDENTSHIP DRAWINGS.

These doorheads are from houses in the old residential quarters on the outskirts of the city proper. They are all of wood, and have been so often painted that much of the detail of the fine carved work about them, has been covered up. The first, with the carved brackets springing from the pilasters, is from a large house in Magdalen-street, and forms part of the main entrance to what was once a fine front, some 70ft. in length. The house is of three stories, and has a richly-carved cornice and pediment. Shops have now been inserted in a portion of the lower part, and the house has been divided-up into tenements. The doorhead with the shell supported on carved brackets is from a house in Bradnich-place, and is coarser in detail than the former. The remainder are from houses off Gandy-street.

Sidney K. Greenslade.

LODGE AT ASKHAM HALL, YORK.

This has been built at one of the outlying entrances to the park at Askham Hall, the seat of Sir Andrew Fairbairn. It is erected in brick, with red-tiled roof. Messrs. Chorley and Connon, of Leeds, are the architects.

LEEDS AND COUNTY LIBERAL CLUB: STAIRCASE.

This staircase, to which the drawing scarcely does justice, is erected entirely in oak, and is of considerable size, the width of going being 6ft. has a picturesque effect in execution, is ligh by five large painted windows, and approac from a hall laid with an exceedingly beauti mosaic pavement. The club house to which stairs is attached is one of the largest in the p vinces. It contains a smoking-room 68ft. by 24 a dining-room 79ft. by 24ft.; a reading-ro 45ft. by 24ft., and a billiard-room of the sa size. In addition there are two other billia rooms, grill-room, private dining-rooms, ca room, members' bedrooms, and other apartme A feature of the club is the excellence of ventilation, which is attained by mechan means. Accurate measurements taken by anemometer proved that the air was changed the smoking-room eight times, in the dini room six times, and in the billiard and readi rooms four times every hour, results which pl the building amongst the best ventilated structu of the kind. The buildings have been erec by local contractors from the designs by Mes Chorley and Connon, of Leeds.

TRUNCH CHURCH, NORFOLK.

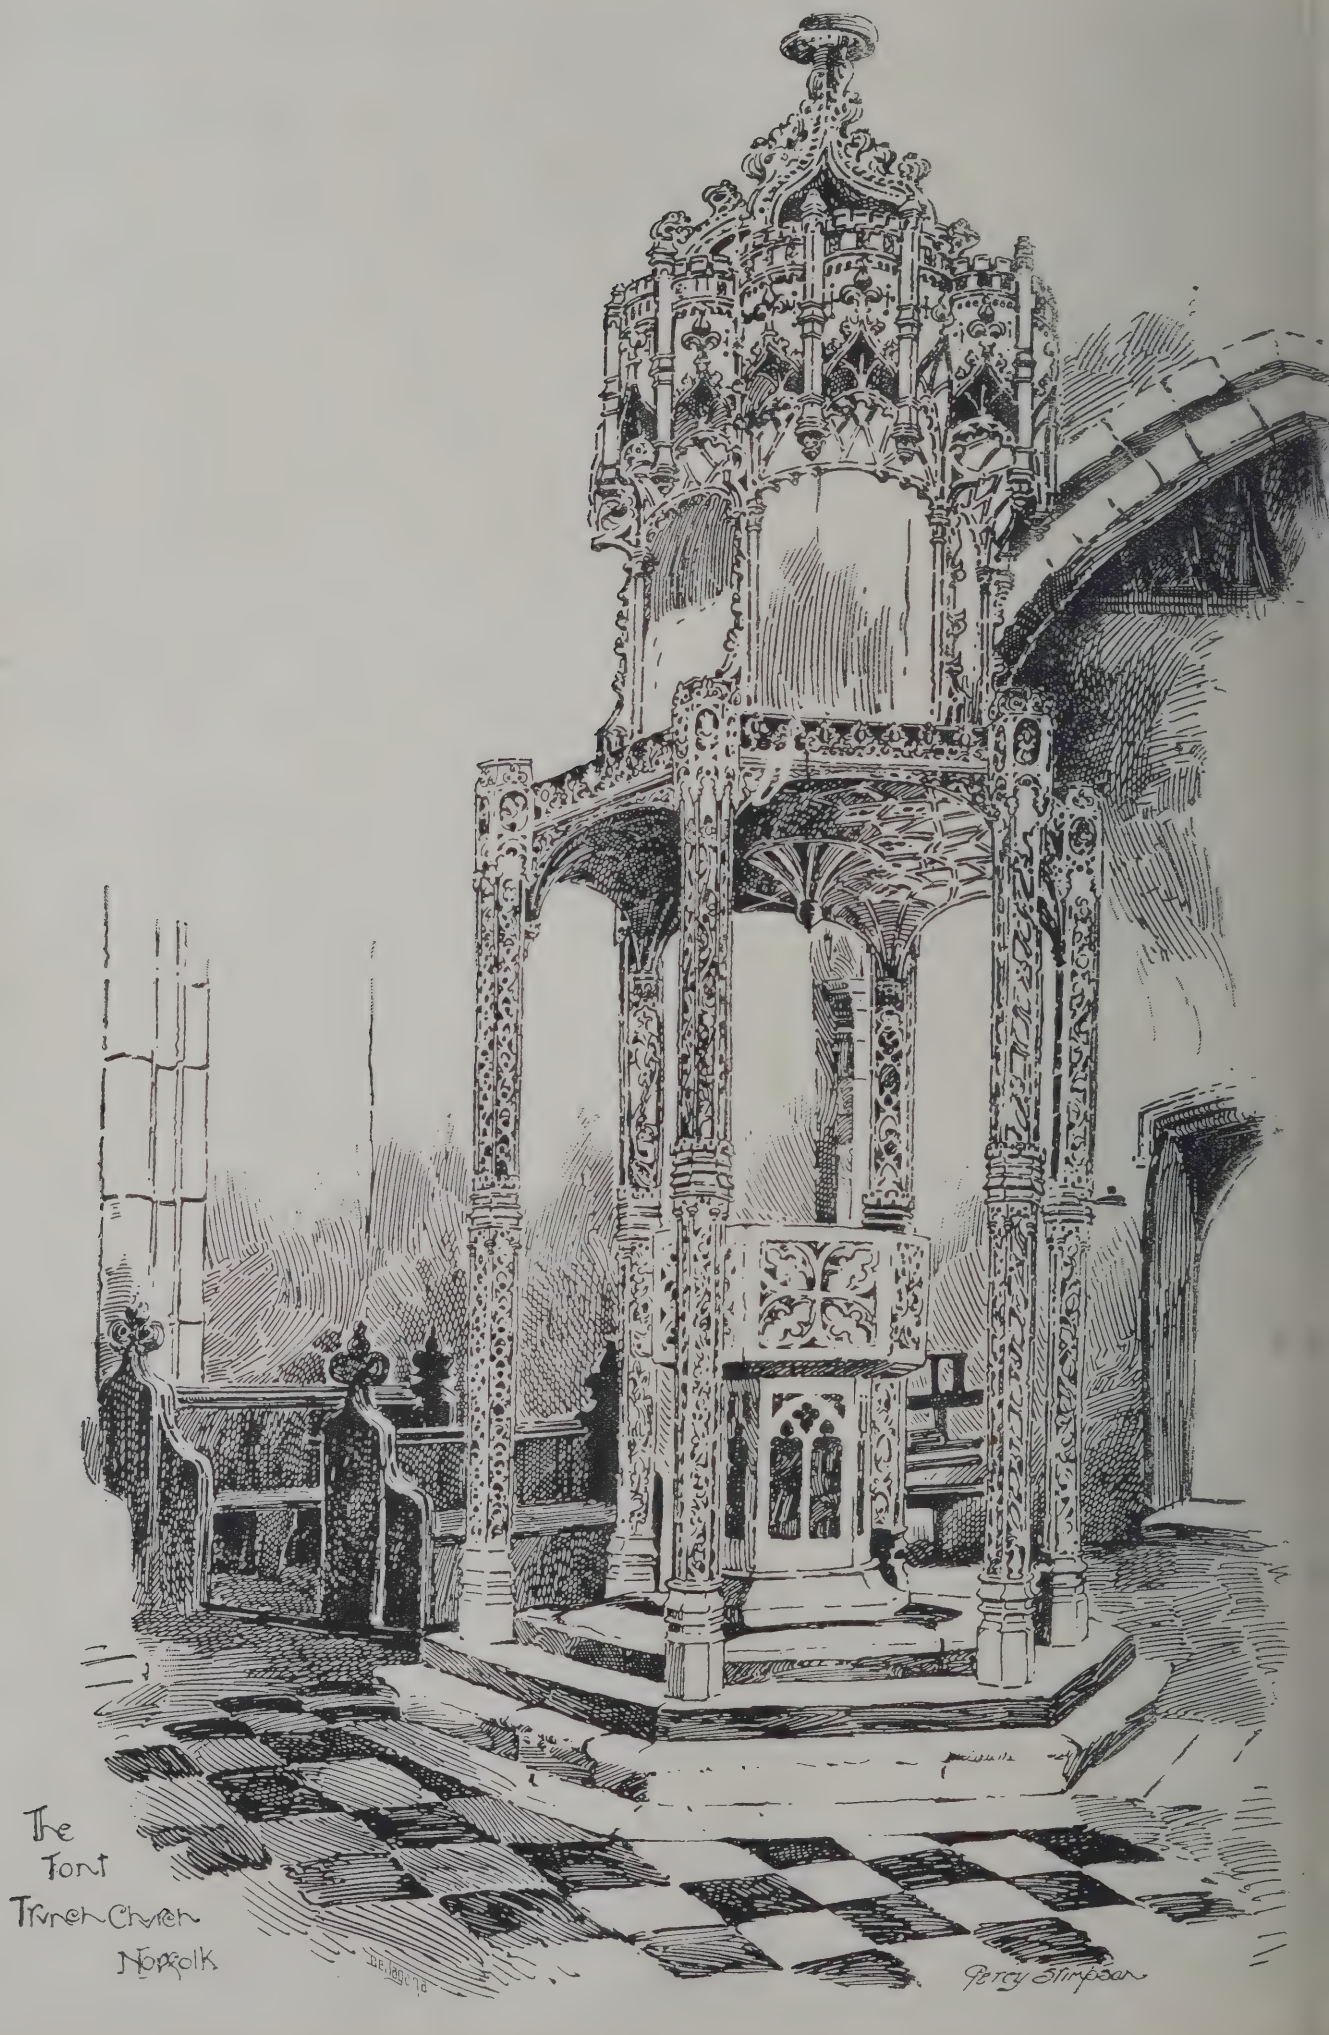
(For description and further sketches, see page 591.)

CHIPS.

The memorial stone of St. Joseph's Catholic Schools, Richmond-grove, Longsight, Manches was laid on Saturday afternoon. The building be two stories high, will cover a space measu 100ft. by 35ft., and will be faced with Rua stocks. Accommodation for 500 will be provi The total cost is estimated at £3,200. The archit are Messrs. Heathcote and Rawle, Princess-st and the contractors Messrs. Wilson and Toft, C road, Manchester.

Substantial progress has been made with project for rebuilding the church of St. Werbu Derby. Yesterday (Thursday) the Chancello the Diocese, the Worshipful A. B. Kempe, gra the application for a faculty, there not being serious opposition. The committee purpose to ceed as early as possible with the building of chancel of the new church on the vacant land the north of the existing structure, leaving latter standing for the present. The architect is Arthur Blomfield, and the contract for the portion of the work has been provisionally le Messrs. Shillitoe, of London.

In the case of William Ledbury, of Oldwinsf builder and contractor, the registrar has suspen the discharge from bankruptcy for two years.



One of the largest statues carved in this cou has left the studios of Mr. Harry Hems, at Exe for India. It is destined to surmount the n gable on the principal façade of the new Munic Buildings at Bombay, which are being erected f designs by Mr. F. W. Stevens, at a cost of £100, The statue is a colossal allegorical one, represen a winged female, 14ft. 6in. high, and is of st weighing nearly five tons. The six colossal fig that went from Mr. Hems' studios early in Au for the same building have arrived safely, and h been placed *in situ*, to use Mr. Stevens' wo "literally without a scratch." We illustrated Bombay Municipal Buildings in our issues Nov. 7, 1890, and June 19, 1891.

The excavations of the Priory ruins at Ca Acre have been stopped for the examination Saxon cemetery in a distant part of the same pa This has been carried on at the expense of Willett, of Brighton, and has resulted in the find of a large number of cinerary urns, only a few which remain entire. A report of the discove is being drawn up by Mr. Housman, of Chiche

A stained-glass window has been placed in the n aisle of the nave of Canterbury Cathedral in mem of the late Dean Stanley of Westminster, who at one time a canon of Canterbury. The win is of four lights, with two tiers, divided b transom.

A carpenter named James T. Hollidge, Duncan-street, Newington, was, at the Lam Police-court on Monday, charged with assaul James Quale, another carpenter. The prosec stated that because he would not join in the st the prisoner and other men assaulted him, e while he was under police protection. The ma trate fined him £5, and refused to allow him tim pay it.

New works for the supply of water by gravita to the village of Lochwinnoch, West Renfrews were opened on the 15th inst. The works h been carried out by Messrs. McKerracher Ballantine, of Bo'ness, from plans by Mes Niven and Haddin. The reservoir holds e million gallons, and is situate at Ladyland, miles south-west of Lochwinnoch, to which a main brings the supply.

BOOKS RECEIVED.

Mensuration made Easy, or the Decimal System for the Million (Effingham Wilson and Co.) is the twentieth edition of a useful shilling work. The author gives a table of multipliers for reducing brickwork of any thickness in one operation to rods, cubic yards, or feet. He shows that to convert cubic feet to rods it is only necessary to multiply by ·00327, to convert cubic yards to rods it is similarly requisite to multiply by ·0883, and to convert cubic feet to yards one must multiply by ·03704. Simple rules are given for obtaining the areas of fields, and for estimating the contents of squared and round timber, and for paper-hanging a room.——*A Catalogue of the Parkes Museum* has just been completed by the secretary, Mr. E. White Wallis, F.S.S. It is classified in four divisions —(*a*) science in relation to hygiene, (*b*) hygiene of special classes, trades, and professions, (*c*) construction and sanitary apparatus, and (*d*) personal and domestic hygiene. —— *Notes on Building Construction.* Part I. First Stage or Elementary Course. New edition, enlarged. (London: Longmans, Green and Co.)—The new and revised edition of this useful textbook is arranged to meet the requirements of the syllabus of the Science and Art Department. This Part treats of all the points required for the examination in the first stage, and will be found very comprehensive, and well illustrated by diagrams and details of construction, under the several trades. The additions that have been made to this volume comprise chapters on riveting, centres, built-up beams, and plate girders. These have been transferred to this volume from Part II., and have been revised. The chapter on iron roofs has been rewritten, and seven plates have been added of copies of contract drawings for recently constructed roofs. The other chapters have undergone revision. We notice a very full and succinct *résumé* of brickwork. The different bonds are clearly illustrated by plans and sections of courses for various thicknesses of walls and angles, reveals of window and door openings, square and splayed. In masonry, the classification of walling, natural bed of stone, are described with the aid of engravings; joints, such as metal, dowelled, joggling, plugging, are explained and shown by isometrical diagrams. The joints in carpentry are equally well dealt with, and the principles to be observed inculcated. Faulty connections are pointed out, as that of "double tenons," which weaken the timber; both tenons seldom bear equally, so that only one of them has the strain to bear. The chapter on riveting is very fully treated, and amply illustrated by "lap joints," "fish joints," zigzag, "chain," and other kinds. The modes of riveting for tensile and compressive stresses, and the essentials to be kept in view are clearly stated. Various forms of built-up timber beams, curved ribs, and trussed girders are illustrated, floors of the several varieties are described, and timber and iron roofs are fully detailed, the connections in all cases being carefully shown. Slating and plumbing work, and joinery are other subjects which have been carefully revised and brought up to date. No better elementary treatise on building construction can be had. The drawings of details are excellent.

TRUNCH CHURCH, NORFOLK.

TRUNCH, called Trunchett in Domesday Book, is a quaint little village situate about three and a half miles from North Walsham, and is about the same distance from the once famous Bromholm Priory. It is said that it had a market as late as the sixteenth century, which was probably held in the open space east of the church. Here also were held the guilds of St. Botolph and St. Mary. The church, a handsome and extremely interesting structure, is of the Late Decorated and Perpendicular periods, is dedicated to St. Botolph, and was erected on the site of an older edifice, the patronage of which was granted to the Prior of Castleacre by William Earl Warren in the reign of Henry III. The fine open-timber roof is of hammer-beam construction, and springs from carved corbels. At the ends of hammer-beams there are figures of angels, and the spandrels are filled with pierced tracery. The rood-screen is of most elegant design, its lower panels having paintings of the Twelve Apostles, and above these the rails having carved scrolls intervened between foliage on which is painted a Latin inscription. The upper part of the screen consists of seven arches, three on either side of doorway springing from moulded studs—these are surmounted by a carved and gilded cornice of exquisite detail. The font is Late Decorated, and stands beneath a tester or baldachin of richly carved oak. The cover is supported on shafts of pentagonal form about 7ft. 6in. in height, carved from the base with twisted foliage. On the inside face of one of the shafts is a quaint representation of St. George and the Dragon. There are traces of the Crucifixion in the panels below the beautiful crocketed canopy. The priest's doorway at south side of chancel, as shown, has a stone porch in the Decorated style, which is remarkable for having a buttress rising from it. On a monument in the chancel is the following:—"Lancellotus Thexton, Capellanus Regis Edw. VI. sacre theologie baccalaureus, et Rector de Trunch, obt. 25 Feb. 1588," and on a gravestone, "Hic jacet Magr. Robt. Cantell quod. rector isti. ecclie. qui. obt. 1 Sept. Ao. Dni. 1480."

CHIPS.

At a meeting of the Leith town council on Friday, a resolution approving of the report of Messrs. Leslie and Reid, civil engineers, as to the necessity for an additional supply of water, and as to the suitability of the Manor scheme for such supply for Edinburgh, was carried by 11 votes to 4.

A movement is on foot for the further restoration of the Abbey Church of Bourne, Lincolnshire. Mr. Traylen, the architect for the previous work, estimates the cost at £1,000, including £425 for re-roofing; and some £850 having been promised, it has been decided to proceed with the reconstruction of the nave roof.

The new tower and spire just added to St. Luke's Church, Kingston-on-Thames, were dedicated on Sunday.

Memorial stones of a Bible Christian mission chapel to be built in Hereford-street, Maindee, Newport, Mon., were laid on the 15th inst. The building will seat 400, and will cost £850.

An inexpensive improvement is being made in the ordinary spirit-level by a New York firm, by means of which a level is made luminous, to facilitate the carrying on of work where the use of a level is necessary, but where the light is not good enough to readily see what it indicates, and even where it is absolutely dark. The tube is made in standard sizes, of the usual form, to be set in the ordinary way, and a strip coated with a luminous compound is permanently attached to the back of the tube by a wrapper, which excludes dust and is treated to withstand moisture. The bubble is visible from the side or top, as usual.

WAYSIDE NOTES.

CHOOL-BOARD architects are having quite a benefit just at present. I have noticed a ck of no less than three advertisements for w school buildings. The combined boards of boroughs of Walsall and West Bromwich pose to erect a "truants' school" at Lich-d; the board for the parish of Pembrey require ns for new buildings at Burry Port; while the rthfleet School Board, not content with its leavours of some six years back, contemplate litional accommodation for boys, besides a chen, presumably for culinary tuition. Really Education Acts have been great gain to the hitectural profession, notwithstanding the fact London schools being produced on the whole-e manufacturing system. The various build-gs required in the provinces have brought ndant grist to the mill, and will continue to so for years to come. The architect who has tened on this class of work must surely con-er that the education of the masses is a good ng indeed, and have a kindly, post-prandial ling towards school boards in general.

I anticipate something "coming our way," as r. Mould used to say in connection with th these school competitions. There will be nething to talk about respecting that for the ool at Burry Port. The advertisements state at competitors must name the terms upon which ey are prepared to carry out the works, which ans, I expect, that there will be some *under-tting*, in nature different from that of the 13th-ntury stonemason. We shall have some ore "throwing in" of travelling expenses, d further offers to do all things necessary, in-ding the finding of receipt stamps for dis-arging accounts, for four and five-sixteenths r-centum on the estimated outlay, extras only cepted. Doubtless several architects anxious uphold the dignity of the profession have itten to the Pembrey School Board stating that, less the terms are to be as customary for pro-ssional work, they cannot compete. I only pe that any such protests may be successful, d be the means of avoiding another unseemly ramble for work, by undercutting, such as we tnessed not so very many months ago.

The Northfleet School Board, I notice, offer a fee" of fifteen guineas for the best set of ans. The word premium is not used. All ings considered, there seems wonderfully little ance of the recipient of this sum carrying out e works.

The new era of the Architectural Associa-on will date from Friday evening last, hen Mr. F. T. Baggallay delivered his able ldress, and spoke of the changes that ve been made in the old order of things. et it not be forgotten that the present com-ittee of the Association are building upon undations laid by its predecessors. The first ep has been successfully taken, and, excepting ose who bore the brunt of the fight, none can ow how hard that was in face of the actual position of some, and the dubious attitude of hers, among the latter of whom I must con-ss myself to have stood. But now the change made, I feel sure that all who held back will me forward and help in what way may be open, iving, at least, their hearty goodwill to the new enture, and something more concrete and solid an goodwill, if such be in their power. Now at the new organisation has been set up, the ne thing needful to insure success is individual thusiasm on the part of members. Financial ssistance is the backbone, but a nervous energy only given by the active co-operation of embers. Such interest and enthusiasm as is ow required has not been wanting in the past, nd I do not doubt but that it will be always rthcoming in the future. The fact of the volution in the system of teaching being stablished will not do away with the neces-ty for mutual intercourse and self-help—ie basis of the old formation of the Asso-ation. Rather does it demand a more orough consolidation of these principles, in at now there are greater responsibilities and igher aims.

Among architectural circles on the Continent uite the topic of the week must have been the pening of the New Museum at Vienna by the ustrian Emperor. The late Gottfried Semper and Baron Hasenauer have produced no work finer—in its own class—than this museum, where the Royal House of Austria have installed their splendid collections. From the reports of the opening ceremony on Friday, it appears that the Emperor was more evidently pleased than for many years, and when Baron Hasenauer conducted his majesty to a corner of the new museum where a wonderful view of many of the noble buildings of Vienna was presented, he gave forth unmeasured expressions of pride in the architectural adornments of his city—as well becomes a monarch in a capital city where they would not deface public buildings with unsightly stock-brick excrescences. The works of the late Professor Semper and Baron Hasenauer have been well illustrated at times in this country, so that many readers will know the pleasing, suitable character of the buildings of these renowned architects, even if they are unacquainted with the particular and exact style of the new museum at Vienna. The Hofburg Theatre, with its bold proportions and generally fine grouping, and its refined detail, will be familiar to all. Would that we had a theatre façade in London to equal this Vienna building in dignity of effect! The orders of columns running through two floors in the Hofburg Theatre makes the building, at first sight, appear more Classical than the New Museum, but practically they are similar in tone in this respect. According to the description of the interior of the museum—which has not been generally illustrated, so far as I am aware—the internal work seems to be very rich and magnificent. Baron Hasenauer being alive, takes much of the credit of this work, and has indeed been exclusively concerned with some portions of the design, while, on the other hand, parts are referable solely to the handiwork of the dead Semper.

An engineer of Buda-Pesth has sought permission to make a preliminary survey for a tunnel under the Danube, "similar to that under the Thames," says a Dalziel telegram. This is rather vague and puzzling when we are further told that it "will, however, be constructed for tramways as well as passenger and vehicular traffic." I know of no tunnel under the Thames accommodating passenger and vehicular traffic. There is Brunel's tunnel with an ordinary railway running through it, and the C. and S.L. Railway tunnel with an electric system of transport, and, further, a subway sufficiently big to accommodate undersized pedestrians somewhere by the Tower of London, though I have never been bold enough to discover its exact whereabouts. Dalziel's telegraphist must have had in mind the proposed Blackwall Tunnel, which exists solely on paper, and seems likely so to do for some time.

Speaking of Brunel, I am reminded that a few months will see the broad-gauge system of the Great Western Railway finally abolished. This decision of the directors has, I feel sure, been against their own individual wishes, as, so far as I can ascertain, it is also against the wishes of the servants of the company of all grades, excepting, perhaps, the gentlemen who clean the big engines and fancy, possibly, that a 4ft. 8½in. maximum gauge will make their work lighter, and who don't appreciate the convenience that accrues to the drivers and stokers who can get in an out and about the machinery under the boiler without getting grimed in oil, where the same is impossible in the modern locomotive put together with the compactness of a watch. It will be a loss to the public, who appreciate the roominess of the broad-gauge carriages and the steadiness of the running, and some small section of whom may feel interest in the "Leviathan," "Rover," "Lord of the Isles," or other giants of the railroad of Brunel, designed, withal, by Sir—then Mr.—Daniel Gooch, for whose work volumes are said by the fact that many of these engines have been running forty to fifty years, albeit that they may have been reboilered times without number, and can yet give "odds" to any locomotives running to the north, south, east, or west of the Metropolis.

It seems like an old English institution disappearing. I would that it could be retained; but it will appear that the inconvenience and loss arising from the two gauges has compelled the directors to decide to abolish the third or outer rail in the systems where three rails are laid, and to substitute the narrow gauge for the South Devon and West of England lines, which have never had the third rail we see at Paddington. Doubtless it is the changing of loads from broad gauge trucks to narrow gauge, or *vice versâ*, at Bristol that has been found the most serious inconvenience, and colliery owners and others in the North have doubtless done their worst to influence the directors. Anyhow, the change is to be made. The coming event has in a way cast its shadow before. Those with a critical eye for different types of rolling stock will have noticed there are two kinds of broad-gauge carriages in use at the present time. One is the fine old type—the true broad-gauge carriage making the most of the space allowed by the 7ft. width of railway; the other is merely a carriage of ordinary width mounted on broad-gauge wheels and axles, necessitating, figuratively, a flight of steps (two, actually) to make up the width between the wheels and axles of the carriages. Apparently the broad carriage has been found at times too big. I take this alteration in the type of carriages to have been one step towards the day, now near at hand, when the mighty "Dutchman" shall cease to rush like a whirlwind through the wayside stations of the Great Western Railway, shaking buildings to their very foundations.

GOTH.

PATENT ENCAUSTIC TILES.

MESSRS. MALKIN, EDGE, AND CO., of the Patent Encaustic Tile Works, Burslem, have brought out two new sheets of designs of hand-painted and majolica glazed tiles, hearths and panels, and other decorative adjuncts of fireplaces. These arrangements of glazed tiles are particularly rich in colour. No. 561 is a slabbed hearth 4ft. wide, with back hearth composed of deep-brown mottled tiles as margins, relieved by borders of green and yellow in three compartments. The centre has a panel representing a landscape, rather too naturalesque perhaps, which would have been better substituted by geometrical patterns, such as those which fill the end compartments. The designs Nos. 558, 559, 568, and 572 are particularly rich and handsome; we like the last the best as an arrangement. These hearths can be made to any size and in any combination of colours. The tortoiseshell-like variegations in the borders are very attractive and contrast with the brighter colours. Various panels for mantels and cheeks are also shown. Some very beautiful arrangements of glazed tiles 6in. by 6in. and 3in. by 3in., with borders, are also illustrated in another sheet. We may point especially to a new arrangement of tiles of much beauty in No. 685, in delicate shades of pinkish-brown, relieved by yellow. The majolica fender curbs in browns, blues, and yellows in deep shades are very handsome. These beautifully-coloured lithos are drawn to a larger scale, and numbered for reference, thereby facilitating the selection of designs. The London office and showrooms are Sandringham Buildings, 65, Charing Cross-road.

The rural sanitary authority of Ardee have appointed Mr. C. H. Taite, C.E., of Drogheda, as engineer of the Collon water supply scheme, at a commission of 4 per cent. on the cost.

The new wing recently added to the Royal Veterinary College at Camden Town, from the designs of Mr. Arthur Vernon, of Westminster, was opened by the Prince of Wales on Monday. The addition has cost £8,000.

A demonstration took place at Hoyland, near Barnsley, on the occasion of the formal opening of the town-hall tower and clock. The tower and clock cost £600. The tower was from the designs of Mr. W. J. Sykes, architect; and Messrs. Wm. Potts and Sons, of Leeds, supplied the clock, which is four-faced, and can be seen for many miles around. It is from the designs of Lord Grimthorpe.

The memorial stone of the nave of Christ Church, Liverpool, was laid on Saturday. The intention is to replace the whole structure by a more commodious and handsome building. It is proposed first to build the nave, and then, if funds are forthcoming, to go on with the chancel and the tower. The nave, of which the memorial stone was laid on Saturday, will cost about £7,000. It is in the Early Perpendicular style. The church will accommodate 1,000 people. Messrs. Paley, Austin, and Paley, of Lancaster, are the architects, and the contractors are Messrs. Wood and Son, of Bootle, and the clerk of the works is Mr. W. Goulbourn.

THE SOCIETY OF ARCHITECTS.

THE approaching session of the Society of Architects promises to be one of the most interesting and successful ever experienced. The year will open with a dinner on November 10, at the Holborn Restaurant. The President's Address will be delivered at St. James's Hall at 3 p.m. on November 11, to be followed by a discussion, open to members only, upon matters of internal administration, mainly affecting the provincial men; and in the evening the President gives a conversazione at the galleries of the Royal Institute of Painters in Water Colours, which will be an exceedingly interesting gathering. The meeting on December 8 will be at the Suffolk-street galleries, when Mr. Wyke Bayliss, F.S.A., gives a lecture. The galleries being open, this will practically be another conversazione, ladies being invited. On November 24 Mr. G. A. T. Middleton, the secretary, will give an account of the recent excursion to Belgium; and on January 12 Mr. R. O. Allsop will read a paper on "Baths and Bath-houses." More good things are in the wind for 1892.

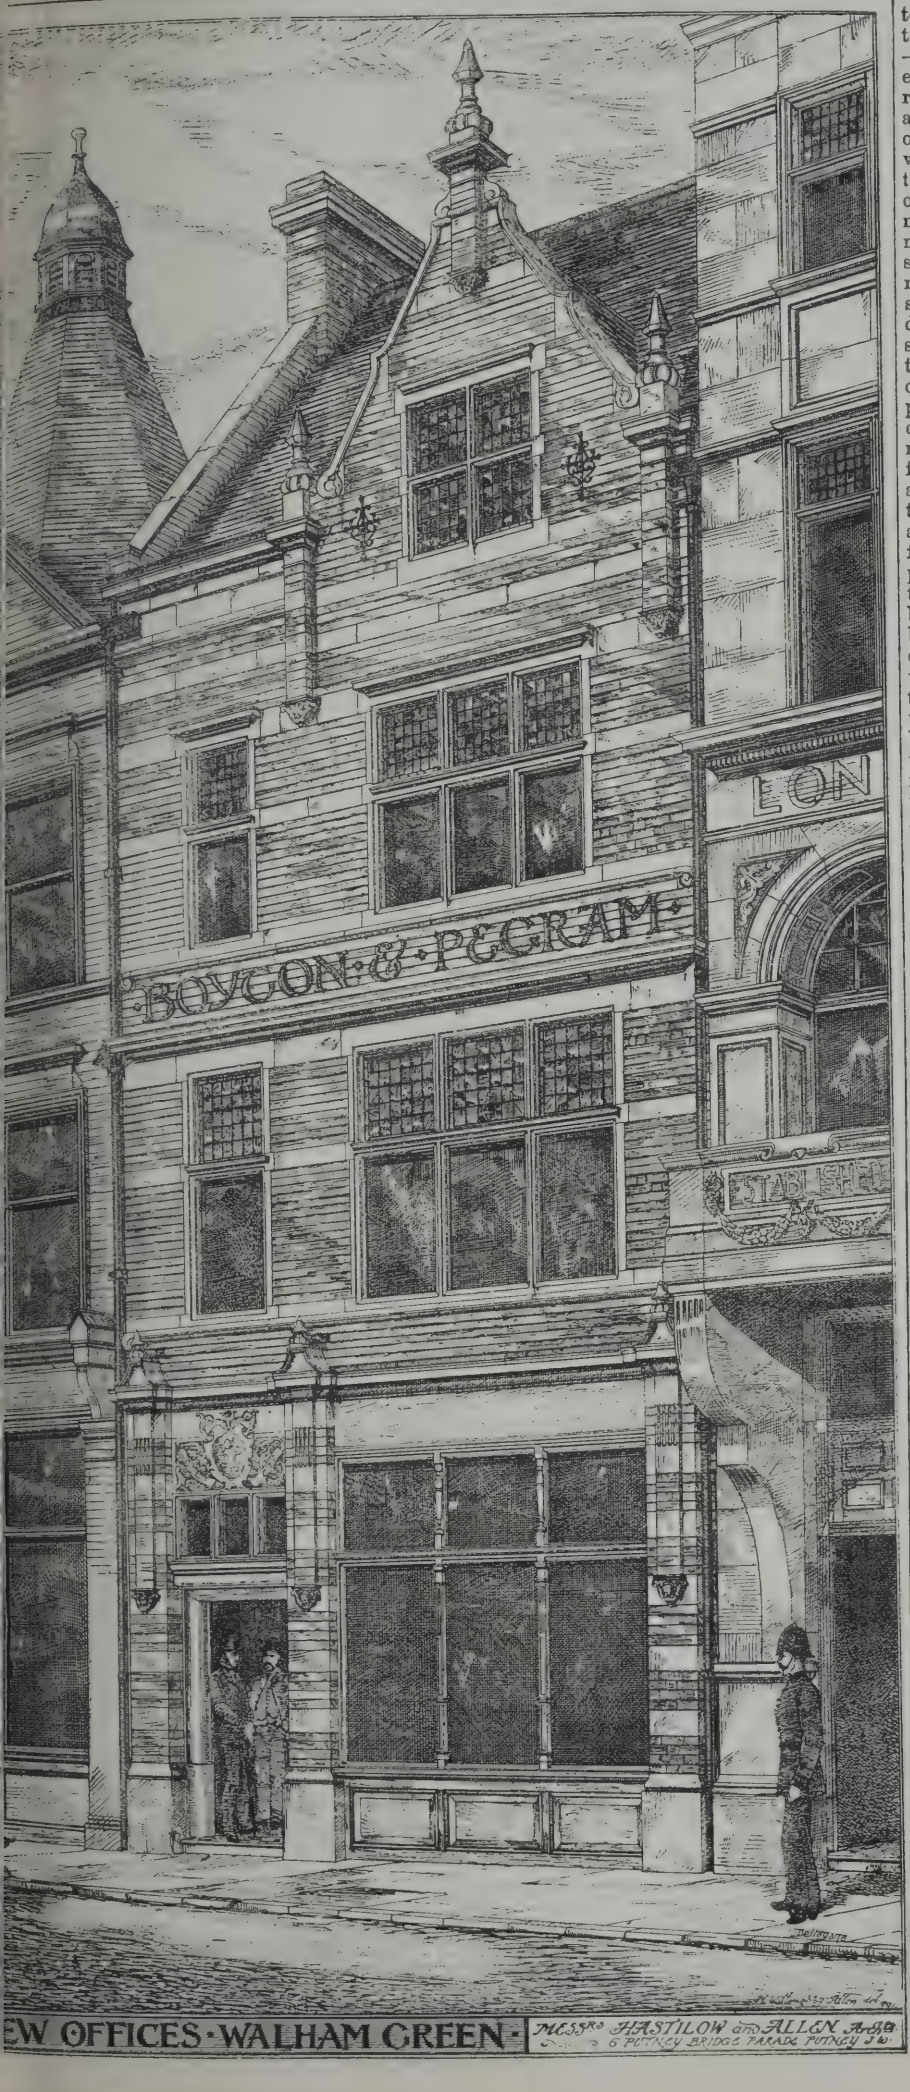
THE CORK COURTHOUSE COMPETITION.

THE award has this week been made from among the thirteen designs which were received for this work in competition for the three premiums offered for the most suitable, in the order of—First premium, £100; second premium, £60; and third premium, £40. Thirteen sets of plans had been sent in within the prescribed time, and eleven of these were hung up for inspection, the other two sets, not being complete, being laid aside.

The following remarks are taken from the report of the professional referee, Mr. Thomas Drew, R.H.A.:—

I should first premise that there is not a single design which, in my opinion, complies with the condition as to limit of cost. It is impossible for any architect to do so. The limits of the building are absolutely defined by the standing walls outside. Every requisite room is dictated, and its measure. Now that the problem is worked out in detail and clearly before an assessor for his estimating, it is evident how delusive was the preliminary estimate, relying on which the committee expected an expenditure of £15,000. The specifying such a sum, or even £20,000, does not make it more possible for an architect to perform an impossibility, or induce a builder to build so much work for less than the value of it. The question of foundations is in itself exceptional in this case, and uncertain in its issue. It is only clear that a considerable expenditure must be underground, and a shrewd surmise the only sort of estimate of this possible at present. The estimates sent in with the designs are fallacious for the most part. No reliance can be placed in the misleading or over-sanguine statements which usually accompany designs in such a competition as this. The detailed estimates furnished are more reliable, and their value is illustrated by the frank statement of one competitor who contributes a business-like plan, and the most economical in the collection. He admits that to bring his estimate to £16,000 he adopts a price of 4¾d. per foot cube over the whole building, which any experienced architect knows would be absurdly inadequate to apply to such a building as this. For the above reasons I consider the committee have no option but to waive that impracticable condition of their own making as to what will be deemed unsuitable in point of cost for Cork Courthouse. They should, I consider, be prepared for an expenditure of £25,000 at least. I place the designs in the following order:—1st, "Fiat Justitia"; 2nd, "For Auld Lang Syne"; 3rd, "Order."

The names of the architects, the authors of the three selected designs, were found to be "Fiat Justitia," Mr. William H. Hill, F.R.I.B.A., of 15, Marlboro-street, Cork; "For Auld Lang Syne," Sir Thomas Newenham Deane and Son, Dublin; and "Order," Mr. William Stirling, of 3, Molesworth-street, Dublin.



It has been decided that the plans should not be open to inspection by the public until the award of the committee should be confirmed by the Municipal Council.

Of the chosen design ("Fiat Justitia") Mr. Drew says:—An admirable, straightforward plan, well-lighted and inextravagant, evidencing complete familiarity with the procedure of Irish law courts, and the convenient provisions to be made for it. The conditions (save cost) are well observed. The courts are placed next the side but quieter streets. This gives some advantages to the rest of the plan. My estimate is £23,300, or, taking away the dome for comparison with other designs, £22,500. He remarks of the second prize design ("For Auld Lang Syne"):—A straightforward notice attached to the section says: "All internal walls are new (see plans). They have been coloured black in the sections by mistake." It would be a matter of great regret if the committee were to hold that the letter of the conditions above should be applied to what is, in the clearest acceptation of the word, a mere clerical error. The plans are all right, and indicate perfectly plainly what is old and what is new work. There is no deception dreamt of, nor could anyone be deceived in any respect by the sections. I do not think any other honourable competitor would wish to see advantage taken of a mere technical slip of this kind. It has no likeness to the deliberate infringement of a leading condition, as in the case of "Fiat Justicia." I am sure that the framers of the conditions never foresaw that the strict letter of them could be turned to apply with unnecessary and quite useless stringency. I take the responsibility of considering this design honestly in the competition, and feel sure that no one would seek to overrule me on such a technicality. On other grounds, it would be impolitic to do so. The conditions provide that the premiated designs shall become the property of the corporation and commissioners. This is an admirable plan, and the committee would be ill-advised indeed not to secure a property in it, having regard to its instructiveness and suggestiveness in framing whatever plan is ultimately carried out. It is not the least expensive plan, but it has the merit, if it be an important one, that the courts are not placed next the streets. My estimate of it is £24,800. So nearly balanced are the merits of the two plans by "Fiat Justitia" and "For Auld Lang Syne" that it is after much consideration, but for definite and good points which score for "Fiat Justitia," I place it first in order of merit. So near a tie is it, that I would feel it no depreciation of my report if the corporation and commissioners, for any preference they might entertain, inverted the order of precedence. Either plan would give Cork a well-planned courthouse. These two designs are, in my judgment, so pre-eminent in point of merit, that there is no question as to their being entitled to first and second places. Following at an interval, the plan by "Order" deserves recognition as a practical and capable plan, worked out with more conscientious regard to the limit of cost than others, and consequently somewhat cramped in its thoroughfares and dimensions of some rooms. In its economy it falls somewhat short of what Cork courthouse should rise to. Waiting room for witnesses is deficient. Jurors' waiting rooms placed on the upper floor is not a good arrangement. The estimate is honestly put forward as arrived at by cubing at 4¾d., but is quite inadequate. My estimate is £21,350.

The mottoes or devices distinguishing the other designs were as follows:—"Vulcan," "Blarney Castle," "Stat Favor Merenti," "Fiat Justitia Ruat Cœlum," "Lex," "Fiat Justicia," "Chicago," "Phœnix," "The Arms of Cork," "Statio Bene Fida Carinis."

THE DECORATIVE TREATMENT OF NATURAL FOLIAGE.—II.

IN his second Cantor lecture on this subject (which, as last week, we abridge by the author's permission from the Society of Arts' *Journal*, all rights being reserved), Mr. Hugh Stannus dealt with realism and conventionalism in the decorative use of foliage. Realistic treatment had, as was remarked in the first lecture, three phases—pictorial, semi-pictorial, and decorative. In complete or pictorial realism, the chief object is represented with the utmost fidelity to the actual appearances, and no regard is paid to the mass shape of the whole or the foreshortening of portions, the whole being a flower-portrait picture, even though painted on a furniture panel without the regulation gilt frame. Such a treatment, examples of which were given, was contrary to the usually-accepted canons of decoration. In the semi-pictorial method, the chief object and the foreground surroundings were all as realistically represented as in first, except that malformation and abno growth were omitted; but the background reduced from realism to the conventionalism flat tint of colour. Such a painting was a fect portrait of the chosen subject, but n picture. Much of the more elaborate m decoration in painting and tapestry was exec in this method. In the third, or dec tive treatment, only the chief object was reali ally represented as in the two preceding meth but everything else was reduced in characte a conventional representation. It was obv that if the higher, or pictorial, treatment retained, it would be thus applied to the prin object. Realism was very appropriate effective in this manner. It could never the work to be a picture; it might be exec on any surface, it would still be decorat Most of the more elaborate foreign picture coverings in brocaded silk and tapestry from designs carried out in this method. T was, therefore, corresponding to the gra reduction of realism in the three method gradual increase in artificial arrangem Realistic representations had their place ir (*a*) Important positions, *e.g.* the centre of a or a cabinet; (*b*) Non-functional portions objects, *e.g.*, panels; (*c*) Movable objects, pictures; and such drapery as tapestries figured brocade-silks, whose evident cost wa excuse for their aim at realism, and would prevent their being lavishly applied. Real representations, in any of the three degree realism, should not be repeated in the s design. When there was repetition, and it produced *by hand*, as in embroidery, it would treated in the second or third degree of reali Where, however the repetition was mechani the details should be generalised. Passing o consider conventionalism, Mr. Stannus obser that in absolute conventionalism, the whol each object is represented in outline. Th are, however, degrees in reduction, from complete realism to absolute conventionali corresponding to the reduction in the avail appliances. With each lessening of applian such as the substitution of mechanical reproduc for handwork, and the replacement of colour flat tint, two results ensued: the student made ambitious efforts, and accentuated more stron the characteristics capable of being portra by the mode of expression available. Thus loss of colour or light and shade was replaced greater clearness in the drawing. The degree of conventionalism arose from the rest tion in the number of available pigments, exemplified in some Japanese paintings and majolica ware, or from the loss of graduat and shading, the flat tints only being availa Where, as in wall-paper designs, the artist reduced to flat tints of colours, his ingenuity taxed to give the necessary clearness. simplest or blot method of effecting this wa use different tints for the various parts o plant, such as a pink for the flowers, a green the leaves, and a brown for the stems; but th while it would give the general shape or mass each part, was inadequate to show the in drawing and details. Each leaf or other feat might, by a second method, be represented separate pieces, with the ground show through. It might be objected that a real was not in separate pieces; but the eye wo take in the several parts as one whole, and t was one of the concessions of technical limi tions which formed the truest conventionalis Variations in the breadth of the grou showing through the parts of a leaf prop tioned to the relative breadths in nature wo aid in the effect. This method of showing ground between the parts was termed "vo ing" from the practice in Heraldry. T tints might be effectually used, one for givi mass, the other for shadow or texture, and suggestive method of employing two tints used by the Japanese, who adopted a dark to represent the upper surface and a light one the lower surface of leaves. The outline (whi in ultimate conventionalism was the sole su vivor) was often very useful when superadded the intermediate degrees, not only for clearn of drawing and distinctness of pattern, but colour and breadth. An outline of any tint the effect of attaching the pattern to the grou thus giving steadiness, and, further, of recognis the surface. The second degree of conve tionalism resulted from either the reduction graduated monochrome—a process often appli

NEW OFFICES · WALHAM GREEN · MESSRS HASTILOW and ALLEN, ARCHTS 6 PUTNEY BRIDGE PARADE PUTNEY S.W.

to painted fans and to wall-papers, or the reduction to graduated monochrome in black and white —of which most of the Limoges enamels were good examples. A third degree of conventionalism resulted from further restrictions in available appliances, such as one flat mass tint on a ground of another mass tint, or to a black mass tint on white. Where all the subject was in one flat tint, the effect was somewhat dull; but variety of appearance and some approximation to nature might be produced by combining the two methods of the mass-blot and the outline. In such a treatment the flowers or fruit should be represented by one method, and the leaves and stems by the other. The fourth and ultimate degree of conventionalism resulted from the severe restrictions in available appliances to outline, either of several colours or of one colour only, which brought the pattern-artist to his last resources. As he could now only trust to outline for effect, the necessity of careful study was now most strongly felt. In outline-work the student should search for and emphasise the difference in drawing between the different parts of the plant. He might exaggerate the serrated edge of the leaf, to distinguish it from the delicately-undulated petal-edge. Departure from the reality would be condoned if the pattern were good, for the aim was not a botanical diagram, but a pattern. Variety in breadth of outline was a resource by which a clear and artistic effect might be produced. This variety in breadth could be regulated either by the light and shade system (much used in architectural drawing twenty years ago, and termed back-lining), or by the mass-line system, under which a weak line was used for the objects furthest from the spectator, and a strong line for those which were nearest, in direct ratio to distance or nearness. A further development of the latter method was to draw the circumscribing lines a little more strongly than the inner lines of an object, each being graduated according to relative distance. In conclusion, the lecturer emphasised the points that conventionalism lay not in changing the natural growth to some preconceived idea of the student, but in rendering all the beauty which was possible with the limited technical means at disposal. Further, limitation of means did not necessarily involve stiffness of attitude, though some had so associated the two ideas that the term "conventional" had fallen into bad repute. With all the loss and restriction of means, there would always remain the power to draw; and thus to endeavour to utilise some of that infinite wealth of beauty which lay around us.

NEW OFFICES, WALHAM GREEN, FULHAM, S.W.

THESE premises have been recently erected, adjoining the new branch of the London and South-Western Bank, for the firm of Messrs. Boyton and Pegram, auctioneers and surveyors. The building is constructed in red brick, with Portland stone dressings, the internal office fittings being entirely of the best English walnut. Our illustration is from a drawing by the architects, Messrs. Hastilow and Allen, and the works have been carried out by Mr. David Seath, builder, under their supervision, at the cost of £1,200.

THE VICTORIAN ARCHITECTS' REGISTRATION BILL.

WE give the draft outline of the Bill for the Registration of Practitioners in Architecture, promoted by the Royal Victorian Institute of Architects, with the cordial consent of outside practitioners, in the present session of the Victorian Legislature:—

WHEREAS it is expedient that provision be made for the Registration of persons qualified to practise as Architects in the Colony of Victoria.

Be it therefore enacted, &c., &c.

1. A Council shall be established, styled "The General Council of Architectural Education and Registration of Architects Entitled to Practise in Victoria," hereinafter referred to as the "General Council."

2. Members of General Council to be eight in all—three nominated by the Royal Victorian Institute of Architects, one by the Architectural and Engineering Association of Victoria, one by the Melbourne University, one by the Governor-in-Council, and after registration has been completed, two by the general body of registered practitioners. Persons nominated to serve on the first General Council to satisfy the Attorney-General that they are qualified to be registered under this Act. Each member of subsequent General Councils to be a registered practitioner.

All members of first General Council to hold office for four years from appointment, and thereafter one member (not being one appointed by Governor-in-Council or by the Melbourne University) to retire in each year, but to be eligible for reappointment.

3. Duties of General Council.—To keep a register of qualified Architects; to remove names therefrom for misdemeanour or disgraceful professional conduct, &c.; to direct the holding of examinations in architecture; to appoint examiners in architecture; to make all necessary regulations for the proper carrying out of the purposes of the Act; names and addresses of all newly registered practitioners to be published within one month of registration in the *Government Gazette*, and in the month of September in each year a complete list to date to be therein published.

4. Persons qualified to be registered at the time of the passing of this Act:—

(1.) Those who, at date of the passing of this Act, are fellows or associates (other than honorary fellows or associates) of the Royal Institute of British Architects, or of the Royal Victorian Institute of Architects.

(2.) Any person of the age of 25 years who, for the three (3) years immediately preceding the passing of this Act, was *bond fide* engaged in practice as an Architect in the Colony of Victoria as a principal.

(3.) Any person of the age of 25 years who has served as pupil or assistant to an Architect, or has been in practice as an Architect, all or either, for seven (7) years in the aggregate prior to the passing of this Act. Classes 1, 2, and 3 to satisfy the General Council, by such evidence as it may require, of their right to registration under these provisions.

(4.) Application for registration under this Section 4 must be made within six months after passing of this Act.

5. Persons entitled to be registered after passing of the Act must:—

(1.) Be 21 years of age.

(2.) Have served apprenticeship (indentures) of four years with registered practitioner and passed qualifying examinations except as hereafter mentioned.

(3.) A person who before passing of this Act has entered upon or completed apprenticeship for a shorter term than four years with a master qualified to be registered under this Act may serve the additional period to make up four years with a registered practitioner, and shall pass prescribed qualifying examination.

(4.) Any person of the age of 25 years who has been engaged in *bond fide* practice as an Architect in the Colony of Victoria as a principal for a period of less than three (3) years but not less than twelve (12) months prior to the passing of this Act shall, on passing the prescribed qualifying examination, be entitled to be registered.

(5.) Any person of the age of 25 years who has had not less than seven (7) years' experience in architectural office work to the satisfaction of the General Council, and has passed qualifying examination, shall be entitled to be registered.

(6.) Nothing herein contained shall prevent the General Council from reducing the term of architectural office experience required in Clause 5 prior to examination to not less than two (2) years in the case of persons of the age of 25 years who can produce to the General Council such certificate or diploma of a University or Technical School as may be recognised by them as of sufficient value to entitle such a person to this reduction of office service, provided that such University or Technical School experience is of not less than three (3) years' duration.

(7.) Provided that any person, whether a British subject or not, who either is or is not domiciled in Victoria, but who has practised as a principal Architect elsewhere than in Victoria, showing to the General Council that he holds such a certificate, diploma, or other document as may be recognised by the Council as furnishing sufficient guarantee of the possession of the requisite knowledge and skill for efficient practice as an Architect, and who can show that he is of good character, shall, on payment of registration fees, be entitled without examination to be registered under this Act.

6. Every person registered under this Act shall be entitled to practise as an Architect in any part of the Colony of Victoria, or, subject to local laws, any other part of Her Majesty's dominions, and to demand and recover in any Court of Law, with full costs of suit, reasonable charges for professional services, advice and visits, travelling and incidental expenses.

(1.) In the absence of any agreement as to charges, the schedule of charges published by the Royal Victorian Institute of Architects, as detailed in Schedule hereto, to be adopted.

7. After the day of no person shall be entitled to recover any charge in a Court of Law for professional services as an Architect rendered within the limits of the Colony of Victoria unless upon the trial he shall prove that he is registered under this Act.

8. Nothing in this Act shall interfere with the right of a duly qualified engineer to prepare plans for and superintend the erection of such buildings as are essential to any engineering work that may come within the scope of his practice.

(1.) A duly qualified engineer for the purposes of this Act shall mean one holding diploma or certificate as a corporate member of the Institute of Civil Engineers (London), or as a Water Supply Engineer under the Irrigation Act of Victoria, or as a Municipal Surveyor under the Local Government Act of Victoria or as Master of Civil Engineering of the Melbourne University, or other diploma or certificate which in the opinion of the Council is of equal value to any of these.

9. Provided also, that on and after the passing of this Act, it shall not be lawful for any public body to appoint any unregistered person as Architect or as Building Surveyor to any such body or institution.

10. On and after the day of the words "legally qualified Architect," "duly qualified," or any words purporting a person recognised by law as a practitioner in Architecture when used in any Act of Parliament, shall be construed to mean a person registered under this Act.

11. After the day of no certificate required by any Act now in force or that may hereafter be passed or that is required by custom from an Architect shall be valid unless the person signing the same be registered under this Act.

12. Provision to be made for penalties on unregistered persons practising for fee or reward or using title of Architect. The Act to apply to the whole of the Colony of Victoria.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Manchester Society of Architects.—The awards of prizes in the students' competitions have just been made by the council. The society's first prize, of £10, goes to Mr. Roger Oldham; and the second prize, of £5, to Mr. A. Jennison. Mr. H. E. Sterry has gained Mr. Holden's prize of five guineas.

Birmingham Architectural Association.—The session of the above association opened on Tuesday evening last, when a good number of members were present to hear the address delivered by Mr. W. Hale, F.R.I.B.A., the newly-elected president. The business of the meeting was opened by a hearty vote of thanks being unanimously accorded to Mr. T. Naden, the retiring president, for his able and untiring services to the association during the three years in which he had held that office. Mr. Hale then delivered his presidential address, in which he asked the members to consider that there is but one true meaning of the term architecture, and that the practice of architecture was an art resting on a scientific basis and not a mere business, and pointed out that a building might be well or ill-planned and soundly constructed, and yet be devoid of architecture; but that it was essentially a part of good architecture that the building should be well planned and built. Mr. Hale then urged that good architecture could not be obtained by mere antiquarianism, and that the study of old work should be made with the view of adapting the principles which produced good results to the needs of modern times, and this could not be done by mere following of precedent, and that good results could only be obtained by basing the artistic elements of architecture on the scientific laws which should govern the planning and construction of modern buildings. In looking to the future, Mr. Hale thought that there was much reason to hope for better things, for though architecture could not be considered level with the times, the work of to-day is greatly better than that of 30 years ago, and the junior members of the profession are enthusiastic, and have greater opportunities than their predecessors. Though, on the other hand, he felt that the general public understood nothing of architecture, and he would like to see some education given in schools in the elements of architecture. Mr. Hale also spoke in favour of a suggestion which had been made, that an "artist architect" should be appointed by city authorities to approve the designs of new buildings. The usual vote of thanks, followed by some discussion, brought the meeting to a close.

ARCHÆOLOGICAL.

Archæological Discoveries at Chester.—The Duke of Westminster presided at a meeting of the Chester Archæological Society on Monday night, at which Mr. F. F. Benson, of King's College, Cambridge, reported the result of his excavations during the past six weeks in the North Wall at Chester. The lecture was illustrated with representations of half a dozen tombstones found in the wall, from which Mr. Benson concluded that the Second Legion had undoubtedly been stationed at Chester. He also mentioned that while only one or two at most of coins of emperors earlier than Vespasian had been found during the excavations, no fewer than 17 Vespasian coins had been discovered, from which he concluded that it was in the time of Agricola that Chester first became a Roman station. He had come to the conclusion that the wall was undoubtedly Roman. Appeals were made for further support to enable these excavations to be continued.

New board schools for 1,110 children are about to be built in Beeches-road, West Bromwich, from plans by Mr. Alfred Long, of that town.

It was reported on Tuesday to the Artisans' Dwellings Committee of the Liverpool Corporation, that during the past year the Victoria-square dwellings had produced a net return of £2 11s. 9d. per cent., and the Juvenal-street buildings 4 per cent.

Building Intelligence

Coventry.—The request of the church au ties "That in order to preserve a permaner cord of the extent to which St. Michael's st leans towards the north-west, Mr. Coun Andrews be requested to mark two points the pavement of the tower," was carried effect on Thursday in last week by him assistance. The measurements prove tha attempt was made by the original builder t out the work exactly. For instance, the story windows appear to be of the same siz pattern; yet during the restoration it was f that no two were exactly alike. A similar of things is the case with the tower. Its walls are of unequal lengths, and consequen is not an exact square. The western wa about 3in. longer than the eastern wall. method of finding the centre of a squar drawing diagonals between the four co not being applicable in this case, the c of the tower was found by measuring at angles from the centre of the four side w Measurements were then made from the walls to discover the point occupied by plumb line when suspended from a point 2 from the ground, and the point beneath centre of the weathercock, 290ft. high, next adjusted, and two small holes drilled in pavement, one at the centre of the tower, the other under the centre of the weatherc these will be marked by brass plates. distance apart is 3ft. 5½in. Finally a true and west line was marked upon the paven The sides of the tower do not correspond the four cardinal points. The new Ordn plan of the city shows a deviation of degrees, and this being tested was found t exact.

Ebbw Vale.—Christ Church was reopene Tuesday week, after undergoing alterations improvements. The interior has been red rated, and the tower has been completed new wooden floors, large double doors, and ing windows glazed. The Welsh church un neath the chancel has also been renovated. church consists of a large nave and aisles, massive columns to arcades, and apsidal cha raised a good height above the nave, approa by a flight of bold steps. The works have carried out from designs, and under the su intendence, of Messrs. Kempson and Fowle Llandaff; the builder was Mr. Morgan, of E Vale, and the decorator was Mr. J. E. Mor of Canton, Cardiff.

Leeds.—Two new Board schools were mally opened on Tuesday. One of these day industrial school, situated in Czar-st Holbeck; and the other an elementary scho Harehills, Roundhay-road. The Czar-st day industrial school is of two stories. ground-floor contains the dining-room, kitc scullery, store-rooms, disinfecting closets, b rooms, and shallow swimming-bath. The u floor provides an assembly-hall and schoolro certified for 300 children. There are sepa approaches for the boys and girls, and sepa staircases. The dining-room is 76ft. by 3 and 16ft. high. There is a large workshop, covered playgrounds beneath it. A caretak house has been erected in one corner of the The heating is on the low-pressure steam syst this school being the first belonging to the L Board in which steam-heating is introdu The apparatus for cooking has been supplied Messrs. Benham, of London. The other plu ing work, as well as glazing, has been car out by Mr. Storey, of Leeds. The princ contractors have been — for the brick masonry and carpentry and joinery, Mes Gould and Stevenson; for the ironwork, Mes Taylor and Parsons; for painting, Mr. Thompson; for slating, Messrs. Atkinson Son. The furniture has been supplied by Mes Illingworth, Ingham, and Co. The works h been carried out from the plans of Mr. Landl architect to the board. The cost of buildi and fittings was £7,000.—Harehills Schoo planned on the central-hall system, and is stories in height. The central halls mea 74ft. by 32ft., and have lofty ceilings. classrooms on the ground-floor have 16ft. c ings, and the upper-floor classrooms are 16ft the collar-beam. They are planned to hold s scholars, and in some instances, by mean sliding partitions, two classrooms can be thr

ether. The total accommodation is for 1,410 olars, exclusive of the central halls. The lding is constructed of brick, with stone ssings. The principal contracts have been ried out by Mr. James Wood. The whole s been carried out under the superintendence Mr. Landless.

Morriston.—The new church of St. David s consecrated on the 15th inst. by the Bishop St. David's. It was designed by Mr. E. M. uce Vaughan, Cardiff, and accommodates 600 rshippers. Mr. Wormleighton, of Cardiff, ried out the carving. The pulpit was made Mr. Wm. Clark, of Llandaff, and the reredos d altar were made by Messrs. Jones and illis, and are both executed in oak, from the signs of the architect. The work has been rried out under two contracts—that for the ndations by Messrs. Jenkins Brothers, of ach-street-yard, Swansea, for £250, and for e main structure by Mr. Joseph Gwyn, of etty, Swansea, for £3,380; but the total cost the work, including boundary-wall and drain, ll be about £3,700.

Newport, Salop.—The parish church was re-ened on Thursday, the 8th inst., on the com-etion of the second section of restoration. The st portion, completed six years since, cost ,600. The present work comprises the re-uilding of the north aisle, the erection of a new stry, and the re-fitting of the chancel. In the rth aisle, the old brick walls have been taken wn and rebuilt from the foundation, divided to six bays by buttresses, surmounted with ocketed pinnacles, the walls being finished ith battlemented parapets. In each bay is in-rted a richly-traceried triplet-window filled ith Cathedral glass. The roof is framed in k timber, and covered with lead. The new k benches stand on a floor of pine blocks, and e passage is laid with Terrazzo marble. The me description of flooring has been laid through-ut the church. The new walls are built of odsall stone. Formerly the nave level was rried right through, but the new floor of ancel has been graduated in three levels. The nctuary is floored in Roman marble mosaic. he altar dais is of marble, the front being in-id with an inscribed text. A canopied double dilia is built into the south wall, and a cre-ence niche on the north side. A reredos in aen stone has been erected. The deal roof has een re-placed by a new one of oak divided into ur bays by hammer-beam trusses supported on rved stone corbel heads. The roofs through-ut, as well as the seating, are now of oak. The ntire work of restoration from the commence-ent of the first portion has been carried out y Mr. G. I. Muirhead, of Newport. The work as been under the direction of Mr. John Norton, .R.I.B.A., of London. The cost of the second ortion of the restoration is £5,000.

North Stainley, Yorkshire.—This church as just been consecrated after being closed for me months for alterations and additions. The ortion existing prior to enlargement was built in 840, and consisted of a square room 36 by 24ft., vith flat ceiling. This is now the nave, and to t have been added a chancel 24 by 17ft., vestry 13 y 8ft., organ chamber, and south porch. The vork is simple 14th-century Gothic, the chancel idge being kept same height as nave, and which dds to the internal effect. The old east window s transferred to the west gable, which before vas a blank wall. The new chancel is lighted y a three-light east window, with similar one n south side. Under the east window inside is plain stone panelling forming a reredos filled vith mosaic in three divisions of the Annuncia-ion, by Davison; below comes the altar shelf, nd in south wall are placed double sedilias redence, and piscina. The roof is of pitch-pine, eft clean, formed with principal trusses and offits of rafters panelled, the old roof over ave being similarly treated. The stalls are of Carter and Co. A new moulded stone arch eparates nave and chancel; also a low stone screen. The altar is raised five steps, and the church warmed and lighted throughout. The cost has been £1,000. The work has been carried out by Messrs. Kay and Sons, of Rainton, and Messrs. Metcalfe and Sons, of North Stainley, Mr. Withers being the architect from whose de-signs and superintendence the work has been carried out.

Shorncliffe.—Operations have already com-menced in the Cavalry and Artillery lines, Shorn-cliffe Camp, by the Reconstruction Department, some of the buildings already commenced being new officers' quarters, mess and residences, en-largement to sergeants' mess and recreation esta-blishments, these works being carried out by Messrs. Wallis, of Maidstone. A riding-school, granaries, and six blocks of troop stables are also in course of erection by Messrs. Patrick, of Chatham. Other works are in the course of pre-paration to follow. These works are being carried out under the supervision of Mr. Walter Mitchell, C.E., Clerk of Works to H.M. Government, under the direction of the Commanding Officer of the Royal Engineers.

Welsh St. Donat's Church.—This interest-ing 14th-century church was reopened on Wednesday week, after undergoing a thorough restoration. The roof has now been restored in oak, the walls newly plastered, the tower pointed and rebuilt where necessary; new wood floors and ceiling have been furnished in the tower. Godwin's tile floors have been placed in the chancel, and a wood-block floor under the chairs on concrete. A new oak pulpit, altar, lectern, font-cover, and chair have been fur-nished; all the windows have been newly glazed in fret lead. New seats have been placed in the chancel; two new windows have been provided, as also altar-cloth and hangings. A new stove for heating, and hanging coronas fitted with lamps for lighting the edifice, and new oak doors with wrought-iron hinges. The exterior has also been pointed. The nave has been fitted with chairs, in place of the old high seats. The cost of the work has been £700. The contractor was Mr. W. A. James, of Cowbridge. The archi-tects were Messrs. Kempson and Fowler, of Llandaff.

COMPETITIONS.

Cotfold Asylum, Somersetshire.—At the meeting on Thursday of the Somerset County Council, formal approval was given to the plans of Messrs. Giles and Gough for the erection of the proposed Western Lunatic Asylum at Cotford, near Taunton, and the asylum committee was given authority to take the necessary steps for the carrying out of the building, with any altera-tions suggested by the Commissioners which might meet with the views of the committee. The Council also authorised the committee to raise a further sum of £50,000 upon debentures when necessary.

Widnes.—In a recent limited competition the plans of Mr. Thomas W. Cubbon, architect, of Birkenhead, have been unanimously adopted for new lecture-hall and Sunday-school buildings in connection with Milton Congregational church, Widnes, accommodation being provided for 550.

CHIPS.

The parish church of St. Olave, Hart-street, E.C., will be opened by the Lord Mayor, after ex-tensive restoration, on Friday in next week.

A scheme for draining the slate quarries in Nantlle Vale, which have been flooded by the Llynfi river, has been prepared. The estimated cost is £12,000, which is to be applied to the opening of the river from the lake for a distance of three miles, thus diminishing the force of the water. Extra hands have this week been taken on at the Penrhyn quarries. The demand at the Llanberis quarries keeps brisk.

St. Michael's Hamlet Church, Liverpool, which has been redecorated, was reopened on Sunday. The decoration has been carried out by Messrs. G. H. Morton and Son, Bold-street, from the designs and under the personal supervision of Mr. G. H. Morton, jun., M.S.A.

At a special meeting of the rural sanitary authority of the Wakefield Union, held on Wednes-day, the 30th ult., it was unanimously resolved that the salary of the engineer and waterworks manager, Mr. Frank Massie, Assoc.M.Inst.C.E., be increased to £250 per annum from the 29th ult.

The Lord Mayor of London on Friday opened the new buildings which have been erected by the Norwich Asylum and School for the Indigent Blind. The original building in Magdalen-street, which dates from 1805, has been reconstructed and considerably enlarged at a cost of £6,340.

At a meeting of ratepayers of the township of Frodsham, on Thursday night in last week, it was resolved to recommend the Runcorn rural sanitary authority to reject the proposed scheme of water supply for Frodsham. The scheme is one submitted by Messrs. Timmins, the estimated cost being £3,600. No alternative scheme was suggested.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contribu-tions.

Cheques and Post-office Orders to be made payable to J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertise-ments, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertise-ments) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Pub-lisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure inser-tion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., L., LI., LIII., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back num-bers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—W. B. W. and Co.—W. G. and Son.—B. of B.—D. D. and Co.—L. R.—J. C. E.—B. T. Co.—W. W. B. H. C.—R. Bros.

"BUILDING NEWS" DESIGNING CLUB.

Received.—F. German, D. McCubbin, Jas. H. Shaw, Otis D. Black, J. T. Lawrence, F. E. Bagshaw, E. M. Robson, T. H. Pope, Sidney Naish, J. Llewellin Smith.
Anxious One.—(The award will be published next week, as usual.)

Intercommunication.

QUESTIONS.

[10650.]—**Floor Joists.**—In a back number of the "B. N." (July 15, 1881), I find the following formula for the size of floor joisting, which also gives the distances from centres :—

$$d^3 = i\,b\,d^3$$

c = distance apart
l = the length of beam } in feet
i = a constant
b = breadth
d = depth.

Would some of your readers work out the depth of joists over 14ft. span, at 18in. from centres, and 2½in. thick, by this formula?—Journeyman.

[10651.]—**Rome.**—Would any of your readers kindly say which are the best books on Rome, and where the most complete history and description of St. Peter's is to be found?—A. W. J.

[10652.]—**Lofty Buildings.**—What are the laws now in operation as to the heights of ordinary buildings in the Metropolis, and can compensation be claimed by opposite owners for loss of light and air in the case of newly erected buildings of unusual height? If so, how can a claim be established?—Mavis.

REPLIES.

[10634.]—**Brick as a Building Material.**—If "M. M." reads my remarks aright, he should find that the sense intended to be conveyed is, that as there are gene-rally more joints in a brick-built wall than in a stone-built wall, there is consequently more likelihood of there being more possible defective joints in the former than in the latter—and where is the building that has no defective joints? Good, hard, well-burnt bricks are incomparably superior to stone as a building material.—Brickwork.

[10640.]—**Sea-Sand in Mortar.**—It is a well-known fact that sea-sand in mortar (or plaster) does attract

hygrometric moisture, especially when the atmospheric moisture is excessive, as just prior to a rainfall. The resulting bad effects are: Damp walls, injury to plaster and wallpapers, unsightly efflorescences, and possible rot to timbers in actual contact with walls.—Brickwork.

[10642.]—**Strong Room.**—I have built several strong rooms, and have found that cavity walls with air-bricks close to the floor inside, and discharging outside under the arch skewback were always successful. Windows are inadmissible, and gas-jets inside may cause escapes and explosions. It is therefore better to hang a portable lamp on a fork outside, with a flexible tube long enough to reach inside. Hobbs, Chubb, Milner, and others will supply strong-room doors. Never fix these till the building is thoroughly dry. Tooth out the brick-work to the rough opening. Build all in cement, and do not lay your floor or turn your arch till the roof is on, the rain will then soak away: otherwise it will saturate your arch and walls, and will take years to dry out. Build all brickwork in cement, and provide an extraction-flue with cast-iron grating built-in half-way up, to stop burglars; and if there is any danger of undermining, put a cast-iron grating under the floor, in the centre of 2ft. thickness of lime concrete. These are wrinkles obtained in building thirty strong rooms.—Robert Phillips.

[10644.]—**Joists.**—"Sap" asks the question, Which sort of three diagrams showing the patterns of the grain at the end, would be the best joists for strength and durability, and why? I can dispose of one of the questions—viz, diagram No. 3, by saying there is no such pattern in joists of deal or plank sizes, and in smaller sizes, such as battens, it would be a rare exception—one so rare that it would not merit a place in this question. I give herewith two diagrams, showing the ordinary modes of converting deals or planks from fir-trees in the Baltic, from which he will see that his Fig. 3 could not be produced. The best wood for strength is the heartwood nearest to the sap ring, from being the newest formed wood. The most desirable is the heartwood as a whole as compared with the sapwood. Diagrams Figs. 1 and 2, show the top or small ends of logs of timber, in which the sapwood freely enters into the converted deals or planks. The butt-ends would be larger, and the sapwood

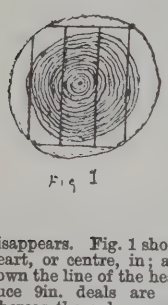


Fig 1

Fig 2

disappears. Fig. 1 shows a deal or plank cut with the heart, or centre, in; and Fig. 2 with the saw passing down the line of the heart. Trees large enough to produce 9in. deals are invariably sound at the heart, whereas those large enough to produce 11in. deals are shaken. The centre plank in Fig. 1 would have the newest and best wood on its edges, and being the most free from sap would be more acceptable than the side plank. The heart being in the centre of this plank, means that it would contain all the faults or shakes natural to the living tree, and all the "drying shakes" associated with seasoning, for if the heart is left in a piece of wood it is bound to shake or split. A better and more perfect joist would be one of those produced from the central part of Fig. 2, where the heart is practically inoperative, and the sap-wood is not pronounced. The question of quality, and the presence or absence of knots and twisted grain, has far more to do with the strength of joist than has the pattern of the grain on the end section; but as "Sap's" question does not travel to these points, any notes thereon would be out of place.—W. Stevenson, Queen's Dock, Hull.

[10644.]—**Joists.**—Fig. 1 would be the strongest section; but as it is a heart scantling, and as it is seldom they are found without heart shakes, it would not be accepted for first-class work. Fig. 2 would camber towards the heart in three directions of its length, and get hollow on the side where the annular rings are concave. Fig. 3, though not the strongest section, is far the best, as both sap and heart are cut out, and the annular rings are across the section, causing shrinkage and warping to be uniform, and enabling every defect to be seen on the largest outer surface.—Robert Phillips.

The foundation-stone of St. Andrew's (Burslem Memorial) Church at Malmesbury-park, Bournemouth, was laid on Tuesday week.

The Waterlow Park at Highgate, opened by Sir John Lubbock on Saturday, is an undulating and well-wooded area of 28 acres, forming the grounds belonging to Hertford and Lauderdale Houses. The former of these mansions has been demolished, and Lauderdale House is also condemned, being in an unsafe condition. The park has been laid out for the London County Council at a cost of £4,900, under the immediate supervision of Mr. Sexby, the surveyor of parks and open spaces.

The town council of Leamington have recently been utilising river water, under the scheme prepared by the borough surveyor, Mr. W. de Normanville, for street watering, sewer flushing, and other purposes. A committee having ascertained that the railway companies, livery-stable keepers, and those possessing gardens would be willing to use the supply if it were available, the town council decided at their last meeting to extend the mains connected with the river, to erect a tank on Newbold Hill, and lay river-water mains in the centre of the town.

Legal.

ABOUT BUILDING CONTRACTS.

It is essential that building contracts should be unlike most others, and that they should contain clauses and conditions which, to a lawyer unused to them, seem very remarkable. Where two people make a bargain about a thing they both understand, then to reduce it to a written agreement is easy enough. But where, as in building contracts, neither side really knows exactly what is going to be done, the position is peculiar. The building owner really leaves it to his architect, and the contractor, in effect, relies upon the same person for his instructions and directions; so we have the curious result that, although the contract is, in form, made between the two parties, the owner or employer and the actual builder or contractor, the architect is really a third and most important party to the whole transaction. He is the agent of the employer, besides being the judge in all things of the work to be done, and through him alone can the builder get his money. The architect works for his employer or client, the owner, and desires to please him in all things, if possible; and yet the builder is placed in his power in every respect. Perhaps the most remarkable feature of the whole arrangement is that the architect should be paid by a commission upon the total amount expended, and which total it would seem to be more to the interest of the builder than of his client, the owner, to make as large as possible. It says a great deal for the honour and honesty of all parties to this curious arrangement that it should work so well as a rule, and should so rarely bring about disputes.

The present form of an ordinary building contract is the result more of traditional usage and professional custom than of law or of logic. One could often wish that these agreements were both shorter and simpler. But the fact is that as the need arose fresh clauses and conditions have been added without much regard to what went before. Somewhat the same thing has happened in some common forms of mercantile contracts and documents, which have, however, acquired a definite meaning by long use; so with building contracts, which though curious and often confusing to the ordinary lawyer or man of business, are pretty well understood by those who are in the habit of handling them. The point is always the architect's central position between the parties as judge of both, though agent only of one, and as really the only person who knows exactly what is going to be done under the agreement that the other two have signed. Still and although these contracts are in practice construed by the custom of the profession and of the trade rather than by definite legal rules, there yet are rules of law which must and will be applied to them if they get into Court, and it is upon some of these rules that I shall hope to throw out a few useful hints in my future notes.

Fred Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by Thursday morning each week.

Young Beginner.—Work Done.—As your work was really done upon extras which were not included in the quantities supplied by the architect, and which were outside your sub-contract, you are not bound to get the work certified by the architect, for, as he rightly says, he has had nothing to do with what passed between you and the builder. Summon the builder for the balance as owing to you for work done and materials supplied, in the County Court.

Architect.—Agency.—Where an architect represents himself as having the authority of his employer, the building owner, to engage a quantity surveyor, when, in fact, he has not, he himself becomes personally liable to that surveyor for his charges, and could be made to pay them in an action. But if the architect could prove either an expressed or implied authority from the building owner, he would then be only acting as an agent, and so he would, of course, escape all personal liability to the quantity surveyor.

At a general meeting of the Royal Society of British Artists, held on Monday night, Mr. F. W. Davis and Mr. Sutton Palmer were elected members.

The 13th-century chancel of the parish church of Helpringham, near Newark, is about to be restored at an estimated cost of £500. Mrs. Tomlinson, of Thorpe Latimer, has offered to carry out the restoration as a memorial to her late husband.

LEGAL INTELLIGENCE.

Serious Charge of Fraud.—William Fred[e] Fryer, surveyor, Arundel-street, Strand, and s[t] to be the proprietor of a periodical called *British Building Journal*, appeared on Friday [w] an adjourned summons, before Alderman S[i] Knight, charged with obtaining money by pretences from Mr. John Frederick Edell, solic King-street, Cheapside, and he was also cha with offences under the Debtors' Act. C plainant said that the defendant came to hi July with an introduction, and stated that he interested in an estate at Greenhithe, which had purchased for £6,200, and upon which required a loan of £5,000. Defendant asked a loan of £200, but this was refused. The e was surveyed, and on July 17th a loan of was made to the defendant upon his dist assurance that there were no judgments pen or out against him. He also said he was on the surveyors of the London School Board for Lewisham district. It was afterwards discov that the whole of the defendant's statem were untrue, and that there were a numbe judgments against him, including a committa twenty days for the non-payment of a loan of issued on the 16th of July. Another judgm was registered against defendant on the 18t July, a receiving order being made against on the 12th ult. Defendant gave a chequ repayment of the loan, but it was returned paid. In cross-examination, complainant st that he had obtained judgment against the fendant in the High Court for this amo Defendant, who reserved his defence, was c mitted for trial, but allowed bail in two sur of £50, and himself in £100.

The Serious Charge against an Archit—Arthur Mucklestone Leach, 38, architect surveyor, of London Joint Stock-buildings, Sm field, and Henry Cove, coffee-house keeper, Bermondsey, were charged, on remand, at S bury, on Monday, with having, in conjunction w a man named Adams, obtained £550 from Liverpool and London and Globe Insurance C pany by false pretences. The man Adams has yet been apprehended. We gave particulars of case in our last issue, p. 561.—The case was ag adjourned, bail being refused.

Advertising Hoardings and the Build Act.—W. Terry, advertising agent, appeared Lambeth Police Court, on Friday, to a summ taken out by Mr. Thomas Chilvers, on behal the London County Council, for having erected advertising hoarding in the Station-road, W worth-road, without having first obtained license from the London County Council. Chilvers said the defendant had, without obtain a license from the County Council, and with notice, erected a large hoarding for advertis purposes. The structure in question was, many others of the kind, liable to give way dur rough weather, and perhaps cause serious inju to persons passing. Mr. Hopkins said by the the defendant had rendered himself liable to he penalties day by day. The defendant said assistant had failed to let him know the circu stances of the case.—Mr. Hopkins ordered defendant to pay a penalty of £5 and £1 3s. co

In re J. M. Ross.—The debtor, John Morgan R carries on business as a timber merchant at Cannon-street and Swedish Wharf, High-stre Peckham, under the style of J. M. Ross and Co. first meeting of creditors was held on Tuesday. T liabilities are returned in the accounts at £11,8 of which £5,740 are unsecured, with assets £2,6 The debtor ascribes his failure to depreciation in value of timber, to depression of trade by reason strikes in the building industry, and to bad deb A scheme of arrangement was agreed to un which the debtor's property becomes vested i trustee acting on behalf of creditors, a claim £2,150 being withdrawn. The creditors a appointed a committee of inspection.

A Contractor's Claim for Commission f Superintendence. — At the Alfreton Cou Court, on the 13th inst., the case was heard Henry Flear v. Mary Cupid. Plaintiff is a join residing at Somercotes, and this was a claim f £30 19s. made up of two parts, £13 9s. being d for ordinary work done, and the remainc (£17 10s.) was for superintending the work of t building of seven houses, being 2½ per cent. on t cost of them. Plaintiff had acted as contract after the first contractor (one Ashling) had faile —Walter Towson, contractor for plumbing a painting in the houses, said defendant said he w to receive instructions from plaintiff.—Mary Cupi of Basford, Nottingham, said she decided to bu some houses at Alfreton last year. She had pla prepared by an Alfreton architect. She nev authorised plaintiff to act as her agent, and did n agree to pay him 2½ per cent. on the value of t buildings. She made a contract with plaintiff to the joinery for £6 per house. She had paid hi £43.—Deputy Judge Lowe said with regard to t

m for £13 19s., he found that the plaintiff had ;ived £43, and not £38, and as the difference been paid into court, that was settled. Then h reference to the £17 10s. for superintendence, charge of 2½ per cent. was as high as that of architect; it was extortionate, and he could allow it. Plaintiff had made out his claim in h a way that he should give judgment for endant, with costs.

ARCHITECT'S CLAIM FOR RE-PREPARING PLANS.—LLS V. POLLARD.—A claim by Mr. A. H. Wills, hitect, of No. 2, Higher Belmont, Exeter, was rd at the Exeter Quarter Sessions, against Mr. derick Pollard (of the firm of W. Pollard and stationers, of North-street, in that city). The larations stated that Mr. Pollard was indebted Mr. Wills for £60 16s. 5d., balance due for work ıs and services rendered by Mr. Wills as archi- and surveyor. The defendant (Mr. Pollard) aded that, with regard to the sum of 11s., which comprised the first two items he claim, he had paid into Court 25s. in full sfaction of the claim. With regard to the residue, Pollard pleaded that he was not liable for thing at all. The defendant instructed plaintiff prepare plans for extended premises, which e accepted; but, unfortunately, very shortly er that, the strike occurred in the Exeter build- trade, and consequently no tender could be got carrying out the work. Some months after- rds, Mr. Pollard gave Mr. Wills further tructions, and he proposed so many alterations t it became necessary to make almost entirely w plans, specifications, and quantities. Mr. lls made those plans, fresh tenders were ob- ned, and one was provisionally accepted, after luctions had twice been made, but eventually scheme was abandoned. The defence was that intiff exceeded his instructions in obtaining sh tenders, and performing other works; but jury returned a verdict for the plaintiff for 3 15s., and costs, beyond the amount paid into rt (£1 5s.)

ARBITRATION AT CANTERBURY.—An important bitration case was held at the Guildhall, Canter- ry, on Wednesday and Thursday in last week, Professor Henry Robinson, M.Inst.C.E., sitting arbitrator. The action was brought by Mr. nnings, as engineer for certain sewerage works, ainst the city corporation. The latter body thheld certain moneys on the ground that as sir counsel contended that Mr. Jennings had led to use his skill in executing the work, and at he was liable either for the ignorance or want want of skill he showed in neglecting to dis- arge his duties properly. For the claimant it as admitted that this was his first independent dertaking, but it was urged that he was in the sition of a *quasi*-arbitrator, and that if fraud ere not alleged, the corporation could not go hind his certificate as engineer. The arbitrator s reserved his decision.

IN RE J. REED.—John Reed, a builder, of ymouth, has passed his examination in bank- ptcy; but on the application for his discharge, presentations were made to the judge, who dered a further examination into the affairs of e estate. That took place on Friday at Stone- use Bankruptcy Court, before Mr. Registrar ridgman. Debtor said he first proposed to sell his siness to a company in February, 1890. He did t enter the payments on account of mortgages in s cash-book, as he did not wish his clerks to be gnisant of the transactions. He made private emoranda of them. He did not inform Mr. John ysaght, of Bristol, a sub-contractor, that he had ld his business to a company, and he allowed Mr. ysaght to go on executing work for him. He ceived for work done by sub-contractors the sum £4,300, £2,800 of which was for work by Mr. ysaght. He did not pay the money to the sub- ntractors, as the engineer condemned the work. is insolvency was due to the delay of the sub-con- actors at Bristol and the severity of the engineer. his closed the inquiry. Bankrupt will apply again the judge in November for his discharge.

RECOVERY OF ARCHITECT'S FEES.—WRIGHT V. ALMER.—The plaintiff, Mr. C. P. Wright, an ccountant in the City, sued the defendant in the ord Mayor's Court on Tuesday, to recover 85 6s. 10d., being the amount of his charges and xpenses in acting as arbitrator in a case in which ıe defendant was then the plaintiff. Mr. Spokes, opening the case, said that up to about three ears ago there was considerable doubt whether an rbitrator could recover any fees; but a case was ecided about that time in which it was laid down ıat a barrister could not recover fees under any rcumstances, even if he acted as arbitrator, but a y arbitrator could. The present defendant had rought an action in this court to recover £1,250 ommission, arising out of the profits on a trans- ction in land in Victoria-street, Westminster. The laintiff was appointed arbitrator. He held ten ttings of three hours each and wrote many letters, ıd finally he made his award, which was in a sealed ıvelope in court, and would be opened on payment of the plaintiff's fees. The plaintiff had charged 60 guineas for his own fees, and £22 6s. 10d. expenses for legal assistance. Under the direction of the learned Judge (Mr. Roxburgh) the award was opened, and it was found to be against the present defendant, who was condemned in the costs of the arbitration. There was no appearance on behalf of the defendant. The jury found for the plaintiff for 40 guineas, and for the £22 6s. 10d. for legal expenses.

CHIPS.

Steps will be shortly taken for carrying out the long-contemplated reflooring of the nave of Manchester Cathedral. It is probable that the reflooring will be carried out in black and white marble.

An ornate oak lectern has just been presented to Brooking Church, Totnes. It was designed by Mr. Edmund Sedding, of Plymouth.

The directors of the Blackpool Tower Company, at their meeting on Tuesday, accepted the tender of Messrs. Robert Neill and Sons, Strangeways, Manchester, for the massive concrete foundations for the tower. The work will be proceeded with immediately, under the direction of the architects, Messrs. Maxwell and Tuke, of Princess-street, Manchester. The contracts for the steel superstructure, 500ft. high, will be placed shortly.

A new theatre, concert hall, and assembly hall in the North Bailey, Durham city, was opened last week. It seats 700 people, and has been built from plans by Mr. William Rudworth, of London. Messrs. G. Gradon and Sons, of Durham, were the contractors.

The Walsall Town Council has sanctioned the purchase of 3,384sq.yds. of land in Lichfield-street from Lord Hatherton, as the site for public baths, at the price of £1 per yard.

Sir John Llewelyn, mayor of Swansea, has intimated to the vicar of that town his willingness to contribute £1,000 towards the proposed erection of a cathedral in the borough.

Mr. C. Purdon Clarke, C.I.E., F.R.I.B.A., has succeeded Mr. G. Wallis as Keeper of the Art Collections at South Kensington Museum. Mr. Clarke retains his appointment as Curator of the India Museum, in the Exhibition-road.

The London County Council have given the contract for the Blackwall Tunnel to Messrs. S. Pearson and Co., who tendered to do the work for £871,000. Only four tenders were received, the highest being for £1,112,000 6s. 3d.

The Swansea Corporation decided on Wednesday to go to Parliament for permission to spend £230,000 on a new water scheme, the new source of supply being the watershed of the river Usk. Thus an estimated additional supply of 5,500,000 gallons a day would be obtained.

The new wing of the Printers' Almshouses at Wood-green was opened by the Duchess of Albany on Saturday. The original buildings were erected from designs by Mr. Philip Welch, and the present and some previous additions have been made in harmony with the main structure under the superintendence of Mr. Charles Bell. The entrance-gates have been made by Messrs. Lockerbie and Wilkinson, Exeter-street, Birmingham.

The foundation stone of a new church at Barnardtown, Newport, Mon., was laid on Tuesday by Lord Tredegar. The designs, prepared by Messrs. Graham, Son, and Hitchcox, are for a building in the plain Gothic style, with random rock-faced Pennant-stone walling and Bath-stone dressings. The roof will be open timber and matchboard, covered with slates. Seating accommodation will be provided for 525 persons, and by making use of flat seats, there will, in an emergency, be room for 620. The internal walls will be stuccoed and the woodwork stained and varnished. The cost of the work will be £3,500, Mr. Charles Locke, of Newport, being the contractor.

A long and excited meeting of the Weymouth town council was held on Tuesday, to discuss a report of the borough surveyor recommending a scheme for the drainage of the borough at a cost of £18,000, the outfall to be into the sea near the Nothe Fort, instead of, as at present, into the backwater and harbour. The mayor proposed the adoption of the scheme, which was vehemently opposed on the ground that the scheme would increase the debt of the borough from £121,000 to £172,000, and was unnecessary, as the health of the town stood very high in the Registrar-General's return. The rejection of the report was carried by ten votes to six.

It was reported to the Paddington Vestry on Tuesday that the directors of the Regent's Park Canal Company had given instructions to have removed the advertisement hoarding erected beside the Regent's Canal in Bloomfield-road, which had been strongly objected to by residents in the neighbourhood.

Our Office Table.

A CORRESPONDENT complains that he finds it is impossible to consult, or even inspect, any mounted map of the Metropolis taken from the Ordnance Survey on the scale of 25in. to the mile, except by a fee to a private firm. Such a 25in. map, as is well known, exists; but even in the map department of the British Museum, it is cut up and bound in such small sections that measurements taken from it could scarcely be accurate. At the City Guildhall, the correspondent remarks, "there is a tattered representation of London on a scale of 4in. or 6in. to the mile, which would be a disgrace to the office of a fourth-rate solicitor." Such a corrected mounted map is, he adds, an urgent want, which some of our public or parochial bodies, or City companies could surely remedy. Such a chart would only occupy a wall-space of 14ft. by 20ft. By the way, it will be remembered that the London School Board find it impossible to procure an up-to-date map, even on the six-inch scale, the outlay on a surveyor and staff for keeping such a map abreast of improvements and new streets within the metropolitan area being officially estimated by Mr. Stanford at £500 a year, and negotiations have been in progress between the School Board and the London County Council, the proposal being that each of these bodies should contribute £100 per annum to Mr. Stanford for revising his map year by year, so as to render it available for municipal and departmental purposes.

THE School of Art Wood-Carving, City and Guilds Institute, Exhibition-road, South Kensington, has been reopened after the usual summer vacation, and we are requested to state that one or two free studentships in both the day and the evening classes are vacant. These studentships are maintained by means of funds granted to the school by the City and Guilds Institute. To bring the benefits of the school within the reach of teachers, a remission of half fees for the day and evening classes are made to them. Forms of application for the free studentships, and any further particulars relating to the school, may be obtained from the manager.

MR. LOUIS FAGAN, of the Print Room, British Museum, delivered a first lecture on line engraving at St. George's Hall, Liverpool, on Tuesday evening. Mr. Fagan began with some remarks upon the art in question, not from an archæological, but from a technical, point of view. Some of the earliest engraved portraits produced in England were reproduced by the optical lantern. Among these were shown likenesses of Matthew Parker, Archbishop of Canterbury, engraved by Hogenberg, perhaps the first engraved portraits executed in England. Mr. Fagan showed also plates by Elstracke, Delaram, the Passes, Rogers, Payne, and Faithorne, who inaugurated the era of English engravers. The lecturer proceeded with a series of engravings by Sir Robert Strange, born in 1721. The interesting and exceedingly scarce portrait of Prince Charles James Edward, the Young Pretender, though feeble in execution, afforded an example of what constituted the highest standard of art in Scotland at that period. The next engraver brought into prominent notice was William Woollett, of Maidstone, born in 1735, the son of a flax-dresser. The "Fishery," the "Death of General Wolfe," the "Battle at La Hogue," the "Niobe," and the "Solitude" were among the other illustrations projected upon the screen. Finally, the lecture finished with William Sharp, born in 1749. Sharp's works are marked by a vigour impossible to surpass. The illustrations included the delicately engraved portrait of George IV., when Prince of Wales, as well as the "St. Cecilia" and the "Doctors of the Church," a plate in which, contrary to his habit, Sharp scarcely put any etching work into the figures.

THE next general meeting of the Institution of Mechanical Engineers will be held on Wednesday, the 28th inst., and Thursday, the 29th, at 25, Great George-street, at half-past seven each evening. The following papers will be read and discussed, as far as time permits: "On some Details in the Construction of Modern Lancashire Boilers," by Mr. Samuel Boswell (Wednesday); First Report to the Alloys Research Committee," by Prof. W. C. Roberts-Austen (Thursday).

The yield of iron ore in the United States is shown by a census return just issued to be 14,518,000 tons yearly. Michigan is, in this respect, the Cleveland of the United States, its output being just about equal to that of the North Yorkshire district in this country. But, despite this large production, there is a considerable import of ore, especially for the Pennsylvanian furnaces. Spain and Cuba supply the largest part of the imported ore, but Italy, England, and Greece contribute also.

CHIPS.

A large clock has been erected in the tower of the parish church, Sawston. The clock has been made throughout by Messrs. Potts and Sons, at their clock factory, Guildford-street, Leeds, and shows the time on two external dials 5ft. each.

The Durban Corporation have recently formally appointed Mr. W. H. Radford, C.E., of Nottingham, consulting engineer for the new sewerage of the borough, to act in conjunction with the resident borough engineer, Mr. John Fletcher, C.E.

The school board for Llandilo Talybont, have adopted plans for new schools at Gorseinon, prepared by Mr. J. B. Morgan, M.S.A., of Lanelly.

A new free library has been erected at Birmingham, and special attention has been paid to the ventilation, the latest improved form of Messrs. Robert Boyle and Son's patent self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

An adjudication in bankruptcy has been made in the case of James Waterman, of St. Bene't-place, E.C., and Sutton, Surrey, timber merchant.

The work of laying down a new marble pavement in Peterborough Cathedral has been begun. The pavement of the choir will cost £2,000, which will be defrayed by Dean Argles. The design is being worked out in mosaic by a band of Italian workmen. The whole work will be completed by the end of next February. It is intended to erect a new reredos, which will be brought forward so as to restore the arrangement as it existed in the old Benedictine choir.

Probate duty has been paid on £27,787, as the net value of the personal estate of Mr. Keeley Halswelle, R.I., A.R.S.A., of Albemarle-street, Picadilly, and Stower House, Steep, Hants, landscape painter, who died at Paris on the 12th April last, aged 54 years.

At Tuesday's meeting of the London County Council a long discussion took place as to the correspondence between Captain Shaw and the Fire Brigade Committee, which has been published. It was charged against the committee that their unnecessary interference with their chief officer had led to his resignation; the committee denied that there had been any interference whatever. The announcement was made that the question of the appointment of a new chief officer would be considered this week, and that Captain Shaw's retiring allowance would be £966 13s. 4d., being the maximum pension of two-thirds of his salary. —Tenders were opened for the erection of a municipal lodging-house in Parker-street, Drury-lane. They varied in amount from £13,988 to £16,597. They were referred to the Housing of the Working Classes Committee.

The Storey Institute at Lancaster is to be opened by the Marquis of Hartington to-day (Friday). It has been built at the cost of Sir Thomas Storey, from plans by Messrs. Paley, Austin, and Paley, of Lancaster, and is Renaissance in style. It occupies the site of the old Mechanics' Institute and adjoining buildings, and has a frontage to Market-street of 43ft., and to Meeting House-lane of 160ft. Accommodation is provided for the School of Art and for technical schools.

A theatre is about to be built at the pier-head, Llandudno, from plans by Mr. Daniel Arkell, of Birmingham.

Shorland's patent warm air ventilating Manchester grates are being used in the new workhouse, Abergavenny, the same being supplied by Mr. E. H. Shorland, of Manchester.

The foundation-stone of the new R.C. church of St. Patrick was laid at Trim on Sunday week. The church will be Pointed Gothic in style, and will be 140ft. in length from east to west, and 70ft. wide across transepts. It will consist of a nave and aisles, chancel, transepts and sacristy, and nuns' choir. The tower and spire will rise to a height of 200ft. The walls are of limestone, with granite dressings. Mr. William Hague, Dawson-street, Dublin, is the architect, and Mr. Patrick Nolan, of Monaghan, has taken the contract at £16,000.

The citizens of York have this week decided, by a large majority, to adopt the provisions of the Free Libraries Acts. In 1881 and 1887 they had rejected a similar proposition.

Trade News.

WAGES MOVEMENTS.

The London Carpenters' Strike.—In accordance with the agreement to refer the questions in dispute between the master builders and carpenters to the arbitration of Mr. MacVicar Anderson, P.R.I.B.A., as announced by us last week, the men resumed work on Tuesday morning on the old terms pending the issue of the award. The arbitration was opened on Monday afternoon, at 9, Conduit-street, W., before Mr. Anderson, when there were present: for the employers—Messrs. Stanley G. Bird, J. Howard Colls, Frank May, G. H. Trollope, T. F. Rider, and J. Henshaw (secretary); and for the men: Messrs. J. G. Bowern (chairman United Trades Committee), W. Apperley (secretary), C. Matkin, J. J. Mackie, T. Abrey, A. Wilkinson, and G. Dew (secretary of the London Building Trades' Committee). At this meeting, which was held in private, it is understood the case for both parties, so far as related to the first two clauses of the memorial—those relating to working time and the minimum rate of wages—was placed before the arbitrator, who had before him the submission to arbitration, and also an agreement to abide by the award, signed by Mr. Stanley G. Bird and Mr. W. Apperley on behalf of the masters and the men respectively. The existing working rules agreed to in 1872-3, with the additional rule as to the two hours' notice and grinding-time to be given on discharge agreed to in May, 1887, were put in by Mr. Bowern, and accepted by Mr. Bird as binding. The arbitrator adjourned the court until yesterday (Thursday) afternoon at 2 p.m., when further evidence was given.—The United Trade Committee have issued an appeal to the organisations who have assisted them during the strike, asking for a continuation of support for a few weeks to enable the committee to pay the liabilities incurred, and to continue an allowance to men who have not yet found employment. This has been well responded to, and for some time to come the local branches will, of course, continue their contributions. The strike pay given on Saturday was 11s. per week for non-union men, and to union men 5s., the latter being increased to 20s. by the several societies. The United Trades Committee have spent about £30,000, which has been raised by a levy upon all the London men who have been in work of 3s. per head per week, besides subscriptions from most of the trade unions in the country. The Amalgamated Society of Carpenters and Joiners have also spent about £18,000, the Associated £250, the Perseverance £700, and the General £1,500. The Machinists have also supported their fellows, and have spent about £1,000, making a total of over £50,000, besides loss of wages. The strike has lasted for twenty-five weeks. During the great strike of 1872, which lasted fourteen weeks, about 2,000 men were affected, and they succeeded in getting a rise in wages with a reduction of hours, the amount of money expended being £7,277. The strike in 1859 lasted twenty-two weeks, and although the men were not successful in getting a rise in wages or a reduction of hours, they succeeded in getting the principle of trade combination recognised by the employers, who had threatened to dismiss every society man in their employ. The strike of Manchester carpenters, which lasted exactly a year (from May, 1877, to May, 1878), in which about 4,000 men were affected, ended in failure.

Carlisle.—An agreement was signed between the master builders and the masons of Carlisle, on Monday, settling the strike, which commenced a fortnight previously. The terms are a compromise. The men accept 8d. an hour, a reduction of ½d. (the masters had given notice of 1d. reduction), and the following arrangement as to hours:—January and December, 8 to 4.30, no breakfast half-hour; November, 7.15 to 4.45, breakfast half-hour; February, 7.15 to 5, breakfast half-hour; from 1st March to 1st June, 50 hours a week, from 6.30 to 5, and breakfast half-hour. It is also stipulated that if the trial of a 50-hours week from March to June be not satisfactory, the question be left to the arbitration of the mayor, whose decision shall be final and binding on all parties. The men resumed work on Tuesday.

On Sunday the Church of the Sacred Heart, Camberwell New-road, was reopened after enlargement, consisting of an addition of about 26ft. to the nave, a baptistery and organ-chamber, with a choir gallery and music-room, &c., new porches, and two towers with lofty turrets. The works have been in hand since April last, and have been much delayed by the strike of carpenters and joiners; even now the turrets are without their roofs, and chairs have to be used instead of the permanent seats. The architect is Mr. Fredk. A. Walters, of 4, Great Queen-street. The builders are Messrs. Thos. Gregory and Co., of Clapham Junction, S.W., and Mr. J. Newton foreman of works.

MEETINGS FOR THE ENSUING WE

Friday.—Architectural Association. "Pitfalls on mencing Practice," by W. H. Bi 7.30 p.m.

The Architectural Association, 9, Co street, W., and 56, Great Marlborough-street, W.

The Architectural Association Courses of Lecture Classes and Studio Instruction are now being carri The Courses are both elementary and advanced, a designed to provide a sound professional architec education, supplementary to that to be obtained prevailing system of pupilage. The Courses also as a means of preparation for the Intermediat Final Examinations of the Royal Institute of B Architects. The Course, which is divided into years, is progressive and consecutive, and the instru is given by Lecturers and Instructors of known abil

First Year.

LECTURES AND CLASSES.—The orders of Greek and Architecture, Building Materials, Geometry, Physics, Persp Mensuration, Chemistry, Geology.

THE STUDIO.—Drawings from ancient examples, Freehand ing, Drawing examples of Construction, Plane Geomet Perspective, Sketching and Measuring.

Second Year.

LECTURES AND CLASSES.—English Architecture, Pri of Construction, Strengths of Materials, Land Surveying, Ch of Building Materials, Elementary Ornament and Colour D tion.

THE STUDIO.—Designs based upon ancient examples, Fre Drawing, Drawings of Elementary Construction, Solid Geo Sketching and Measuring.

Third Year.

LECTURES AND CLASSES.—The History of Archit Materials, Stresses and Strains, Specifications and Quantity S ing, Ornament and Colour Decoration, Sanitary Science, Elem Natural Philosophy.

THE STUDIO.—Design of modern Buildings, Freehand D from Casts, Perspective and Sciography, Constructive Ma Modelling, Elementary Water-Colour Drawing.

Fourth Year.

LECTURES AND CLASSES.—The History of Archit Materials, Sanitary Science, Measurement and Valuation of ing Materials, Professional Practice, The Arts Allied to tecture.

THE STUDIO.—Design of Modern Buildings, Freehand D from Casts, Graphic Statics and Perspective, Modelling, Colour Drawing.

A pamphlet containing full particulars of the Curric and Fees may be obtained free on application t Hon. Secretaries, at 56, Great Marlborough-s London, W.

ERNEST S. GALE, F. T. W. GOLDSMITH } Hon Se

MEDICAL ESSAYS. VOL. I.
By Dr. T. R. ALLINSON

4, Spanish-place, Manchester-square, London, W.

Of the Author, for Postal Order for 1s. 2d.

It contains Articles on: Management of Infancy; Health; Longevity; the Teeth; Brown Bread Bread-Making; Food; Vegetarianism; Tobacco; the Drink Quest on; Fruit; Fresh Air; Exercise; Bathing; Light; Holidays, &c. Also the Cause and Cure of: Disease; Constipation; Biliousness; Eczema Blackheads and Pimples; Nervousness; Coughs and Colds; Chest Complaints; Deafness; Thread Worms; Long Worms; Tape Worms; The Itch, &c.

MEDICAL ESSAYS. VOL. I.
Of the Author, for Postal Order for 1s. 2d

Containing Articles on: The Healing Power of Nature, Clothing, Electricity in Disease; The Urine; Apparent Health; Vegetarian Experiments; The Pig as Human Food; Popular Fallacies about Flesh; The Beef Tea Delusion; Salt; Saline Starvation; Tea Drinking; The Hair and its Management; Sleep and Sleeplessness; Want of Energy, &c. Health Hints for Workers, for Shop Assistants, and for Servants; Advice for the Thin, for the Stout; and on the Proper Treatment of: Simple Fever, Measles, Scarlet Fever, Whooping Cough, Ringworm, Hypochondria, Bloodlessness, Diarrhœa, Ulcerated Legs, Tumours, &c.

Price ONE SHILLING each, by post 13 stamps.

BOOKS ON LAW, by FRED. WETHERFIELD, Solici

A.B.C. LAW of LANDLORD, TENA and LODGER. Leases, Agreements Repairs, Ejectment, and Agricultural Holdings, &c., with *Useful For*

USEFUL LAW for Men and Wom
Business, relating to every kind of COUNTY COU ceedings, Agreements, Liens, Guarantees, Income Tax, Hou Wives, Husbands, Children, Life and Fire Insurance, Sett Deeds of Gift, Mortgages, Trustees' Duties and Defaults, B and all about BANKRUPTCY; comprising 45 Articles.

HINTS UPON LAW, or Practical H in Legal Matters affecting Landlords, Tenants, and Debtors and Creditors, Deeds of Arrangement, Employers' I Bills of Sale, I.O.U.'s, Bills, Notes, and Cheques, Partnersh Executors, Divorce, Desertion, &c., and comprising 40 Article

THE LAW OF PARTNERSH
Being the Code of 1890, with full notes explaining the tion of Partnership, its Dissolution, and all the Rights, Du Liabilities of Partners.

Price Sixpence, by post 7 stamps.

THE PATENTS, DESIGNS, TRADE MARKS ACTS, 1883 and 1888. Incorporate Statute.

To be had of the Author at his Offices, 1, Gresham-build Guildhall, London, E.C.

ARCHITECTS' PUPILS.

FACILITIES for the education and equipment of the architectural student in matters of professional practice are more numerous than they were a short time ago. The old apprenticeship, with its many shortcomings and its inevitable office routine, has no doubt failed in supplying competent men qual to the requirements of the day; but a few questions arise as to how the new system is to be made to co-operate with the old *régime*. It cannot be denied that the pupilage system is more or less of a business compact between the master and his pupil, one agreeing to instruct in the mystery and craft of the profession, and the other to render such assistance as he can give to his master. How this mutual understanding is to be carried out when outside educational schemes are in full operation is a question that concerns not only architects, but pupils. Under the scheme, for instance, of the Architectural Association, the student is required to attend at least three times a week for the evening lectures and classes and the studio courses, the hours of attendance in most cases being from 6.30 to 9.30. These attendances are reasonable enough; but it must be remembered that a student to profit by the classes and studio ought to be able to devote some of his time to private study and preparation. The earnest-minded and industrious pupil will not begrudge the time and study thus bestowed for preparing him for the examinations; but we are afraid a large number will look upon these extra hours to their daily labour as rather arduous and exacting. We know by experience the average class of young men who become pupils; they are not very prone to study or to occupy their hours after the office is closed by applying themselves to hard work. If it could have been arranged to hold the lectures and classes during the office hours of the pupil, he would doubtless have been more satisfied; but, on the other hand, the master would not readily agree to an arrangement which would deprive him of the services of his pupil. Here it must be admitted we have one of the hindrances to a supplemental scheme of instruction. Those who take pupils, as well as the pupils themselves and their guardians, will do well to consider this question in the future. The profession are morally pledged to render every assistance they can to their pupils, and it would not be too much to require that architects who take pupils should undertake to allow them an hour or two on certain days of the week, and undertake to inform the parents of their pupils before they receive them the responsibilities and duties imposed upon masters. But they are not of legal obligation. A statutory or compulsory scheme of instruction would have overcome this obstacle; for we cannot shut our eyes to the fact that voluntary organisations, however excellent they are, have no power to inculcate duties on those who are not parties to them. The profession can, however, by their appointed channels, do something towards obtaining the co-operation of masters, especially in the way of drawing attention to the importance of placing the educational requirements of students before parents and others. For instance, it will be doubly hard on the young apprentice if he discovers that his three or five years' term of pupilage might have been more profitably spent, or that his office training has not qualified him to pass any of the examinations. If his guardians had known, they would have made it a condition of apprenticeship that every facility should be given. We can well imagine cases of this sort. Many young men are articled to architects, understanding that architecture presents an easy means of obtaining a livelihood suitable for those who have a "taste for drawing," but no inclination for anything else—for a lazy, non-studious lad, to whom the other professions are inaccessible for more than one reason. To such, and there are still many of this kind of young men, the temptation to become architects is great; but it is time they were undeceived. Those who advertise for pupils do not take any trouble to inform parents; they rather hold out expectations of certain appointment, and in this way encourage the overstocking of the market with young men of this class. The premium is too often a bait. Men who have little to do take pupils to help them along. Others who wish to dispense with salaries take pupils. One question under the new educational system will have to be considered besides opportunities for joining classes and lecture courses—that is, expense. The old premium covered everything except board, when this had to be provided for; but now the pupil who expects to keep pace with other students will have to find extra fees to pay for his course of lectures. Many young men—at least, their parents—will have to defray the cost of these. To take, for instance, the fees of the Association, ten guineas for each year's course, or 40 guineas for the four years, added to the expense of board, will increase the cost of instruction. Architecture will thus become a more expensive study than it has been, and we may expect these costs will increase year by year as acquirements multiply. But a more efficient body of men will be the result. Instead of mere tyros, the profession will be recruited with young men who have gone through every branch of the art, who know how to design, make working drawings, and write specifications for any kind of building.

Mr. Baggallay's inaugural address before the Association, of which we gave a full report in our last issue, deals with a few points of interest to the younger members of the profession. The old apprenticeship is not so all sufficient, he says, in the latter half of the 19th century as it once was, and there is an urgent call for something in addition. The pupil must bear this in mind. He can no longer content himself with being able to set out any of the five Orders, or to be able to draw Greek temples of various columnar arrangements, which were at one time the Alpha and Omega, like the Greek and Latin of the universities. Modern science and applications to various purposes are absolutely necessary. Then as a qualification draughtsmanship occupies no longer the chief place in the modern curriculum. It is now recognised as a medium of expression; a means, not an end of itself, as it once was. Practical acquaintance with materials and construction in their various applications is now of as much value as the history of styles and artistic construction. But the apprenticeship system taught, and still teaches, only the preparation of plans and designs; hence the need of supplemental teaching, such as that afforded by classes and workshops.

The advantage to a student of advice and instruction is great. How many masters give the time and attention to the pupil he ought to have; give him reasons why certain arrangements and methods of construction are adopted, or take the trouble to explain the theory of any plan or detail? In the contemplated studio course, the value of advice will be equally necessary; in fact, the pupil working out, say, a set of drawings for a hospital or a school from data supplied in the lecture will have frequent need of guidance. As Mr. Baggallay said, students of architecture are poor readers; they read but little, and the books they do read are of the wrong kind. They are too apt to use their pencils for their brains; to take up an illustration or an example when they ought to be reading the laws of mechanical stresses, or treatises, statutes, and Blue Books. Very valuable papers read at the different societies, which give principles and practical results, often, we fear, go unread by the student, who ought to take every opportunity of reading what specialists have to say. Private study and reading are, unfortunately, not the inclinations of the average architect's pupil: he takes more interest in copying drawings and photographs, making sketches of old buildings and scrap-albums for young ladies.

A great weakness of the ordinary pupil's training in the office is that he is deprived of visiting buildings in progress; it falls to a salaried assistant or clerk to do this in the absence of the master. But why should not the indentures contain a proviso that the pupil is to be taken to see works in progress, or be permitted to visit them at certain times? An educational scheme to be perfect will have to make such a provision in the future. This has been a strong point in the Association, and in the new scheme of instruction will be made a part. Much has been learned by the visits to new buildings, and we think that those visits should, if possible, be made concurrent with the studio instruction. It is during the stage of making plans, sections, and detailed drawings that the young student needs the acquaintance of actual workmanship to be able to consult methods and details. By this examination he quickly learns how to make working drawings, how framed work and joinery or mason's work are fixed or set, and the dimensions of parts. One hour of inspection of actual work is worth days of labour on paper. In questions of brickwork and bond, the value of such reference is great. The addition of workshop practice to a curriculum is on the same ground very necessary—in fact, we can hardly understand how a student is to learn the trades without having the advantage of seeing the mechanical operations, such as those of sawing, planing, framing, and the modes of putting joiner's work together. Up to a certain point an architect should be trained as a craftsman. But all these matters are now reversed; he is taught first to be a professional man, and afterwards to become an expert in the arts of construction. Technical knowledge is learned last of all, being generally picked up by experience after many experiments have been made and mistakes committed. These are all questions which have a deep meaning for those who intend to enter the profession. It is quite time the profession as a body begin to realise the weak points of the present system of apprenticeship, and endeavour to make it obligatory on those who take pupils to promote their education, as their own credit and the prospects of their pupils will depend entirely on the opportunities they afford them. It is no longer a question of high premium or of being the pupil of an eminent man, but of qualification and ability.

THE ROYAL SOCIETY OF BRITISH ARTISTS.

THE Winter Exhibition of this Society in Suffolk-street, the private view of which took place last Saturday, contains a few characteristic works by members and others. Beginning with the north-west room, we meet with some well-known pencils. Jas. E. Grace's "Grey Day" (2), a small study, recalls the style and qualities of this inimitable painter of birch woodlands and

forests. A more important picture is No. 38, "Green Leaves among the Sere," a delightful landscape, with the delicate tints of early autumn. The figure of a girl, by John Cooke (6), in a dark blue dress, seated, her hands clasped on her lap, her hair lit up by the sun, is simple, natural, and quiet. The reflected light on the face and the dark background make an agreeable study. In another picture, "Is it Genuine?" (8), by Herbert J. Finn, an elderly man is asking a painter the value of a canvas which the latter is examining in his studio. The latter is full of artistic "properties," and the light and shade cleverly managed, but the composition is too crowded. A rather mannered landscape by Arch. Webb (10) is less important than other subjects by the same painter of Dutch scenery. R. W. A. Rouse has a large number of pictures. "Sunshine and Showers" (14) is full of atmosphere, the grey water and sky, and distant cliffs with the gleams of sunlight are truthfully depicted. "October Afternoon" and "Evening" (26 and 35) are pleasing studies, and Arnold Priestman's "Summer's Evening" (25) is exceptionally good in sentiment and colour. Three gentlemen in the picturesque garb of the 18th century, comparing different versions of some old work, compose a clever picture by W. D. Almond. Two of the bibliophiles sit at a small table discussing the merits or interpretation of a book, while the third companion leans intently over; the expressions of the critics are cleverly drawn, and the interior and accessories painted with knowledge of the period. The meadow and brook of E. W. Waite (23), "The Truant," is a sunny landscape bright in colour, though we can hardly understand the title applied to a youth fishing by the stream—quite a subsidiary object in the landscape.

John Cooke's shadowless landscape of hilly pastures (31), G. Sherwood Hunter's "Market Girls on the Zuyder Zee," and H. Maurice Page's large, silvery-toned landscape with a flock of sheep, "Homeward at Eve" (44) are works of certain qualities of expression and sentiment that call for notice. The two *virtuosi* examining a statuette, by John A. Lomax (44), is also of merit for its drawing, colour, and execution. In the same vein is Chas. E. Marshall's "Old Cronies" comfortably enjoying their pipes in an old, handsomely-furnished parlour, the host lighting his companion's pipe by a cinder applied by the tongs; the composition and details are admirable. We may admire the feeling treatment in Henry Zimmerman's "The Dying Day" (83), a hillside view, and F. H. A. Parker's "On the Road to Bettws-y-Coed." The cold, purple shadows in the road and landscape are a little out of focus with the conventional mode of shadowing; but they represent one of the soundest principles taught in the creed of the apostles of naturalistic painting, of which Mr. Parker is an admitted disciple.

The president, Mr. Wyke Bayliss, has, in the next room, given us one of his grand interiors—this time of Bourges Cathedral. The massive shafted piers and springing of vaults round the noble chevet, with the view of the lofty arches of the inner aisle have been selected by Mr. Bayliss, who gives thus a glimpse of the majestic beauty of the cathedral; the "dim religious light," the high altar in the chord of apse, a group of kneeling worshippers, and the falling shadows with the glimmering candles, add mystery to the scene. The glimpse of lofty shafts round the apse seen under the lower range of outer piers makes a delightful perspective, the drawing and colour of which are full of charm and poetry. A grand piece of colour and perspective is to be seen also in the view of the Duomo, Florence (207), representing the high altar, with its blaze of light and colour. In a lower key of colour, full of majesty and grey tones, in harmony with Cisalpine Gothic, is the president's interior of "Westminster Abbey" (321), in the larger room. The sedate and colourless procession of surpliced choir and clergy in the ambulatory are in keeping with the more Northern example. The drawing and perspective are both admirable, and the work is one of the finest we have seen.

Nelson Dawson's "Sundown," an expanse of blue sea (115), and G. G. Kilburne's "Gossip" (119) are clever. Perhaps one of the most pleasing bits of old-fashioned *genre*—a reminiscence of the last century—is L. C. Henley's "En Passant," a pretty girl in a high-waisted grey silk gown standing listlessly touching the keys of a pianoforte. Elegant and quiet in composition and colour, this is one of Mr. Henley's best. A humbler subject is Haynes King's "Local News" (132), two cottage maidens discussing gossip. Chas. H. Kerr's "Portrait of a Lady" (134), jauntily seated on a writing desk, with a cigarette in hand, is clever; and there is nice sunlight effect in E. H. A. Parker's "Skylark" (142). The water-colours on the screen comprise a few drawings by T. B. Hardy (158), J. S. Noble (167), a fresh piece of river scenery. We must note E. J. Patey's pastel portrait (175) of Miss Cusins, a lady artist; and Dudley Hardy's delightful "Breezy Day, Boulogne" (200), a strong piece of colour, fresh and full of fisher-folk.

In the large gallery we find a new arrangement—the mixture of water-colours with oil. We cannot object to a rule which enables both vehicles of expression to be honestly estimated as art, as the arbitrary distinction between these two classes is not in itself desirable, though we have no doubt that many water-colour painters will disapprove of a plan which places them at a disadvantage with those who paint in oil. Carlton Smith's "The End of the Day" (219) is excellent in composition and sentiment, and the scheme of light and shade good. W. H. J. Boot's "Winchelsea Church" and W. Ayerst Ingram's luminous seascape, "Surf," in oil colour, are notable. The fine architectural drawing of the president (234), "Cathedral, Aix-la-Chapelle," W. Harding Smith's "Church of S. Zeno Maggiore, Verona" (235), and especially his "Canterbury Cathedral from the Baptistery Garden" (415) possess qualities of much merit. Mr. Harding Smith, we need hardly say, has lost nothing of his masterly touch and technical power. The water-colour drawing of the tower of Canterbury is charming in grouping truthfulness. The point of view chosen brings into pleasing sequence the adjoining buildings with their Norman detail. Delightful colour and drawing appear also in Ernest George's small views of the "Doorway and Chapel of St. Andrew's College (259 and 273). Albert Kinsley's large water-colour picture of "The Year's Decline" (244), exhibits breadth and conscientious workmanship in the birchwood and mass of tangled fern, and some delicate handling is to be found in his "Early Spring-Time" (248). H. C. Fox sends two clever subjects (245 and 246). Over the fireplace, R. B. Nisbet's small landscapes "In Perthshire" and "A Moorland" (263 and 269), deserve attention. A vigorous seascape, "Breaking Waves," by Chas. S. Mottram, and works by A. Glendenning, A. W. Weedon (291), and V. P. Yglesias (288) are examples of meritorious treatment. "Old Cronies" (283), by W. J. Morgan, three elderly villagers seated at an inn-table smoking, is a large picture, well grouped, with pleasant faces; but there is a lack of naturalness in the handling. Nice tone and feeling are evident in Val. Davis's "Withered Leaves" (316) and Adam E. Proctor's landscape (324). A clever harbour sketch, "Home Again," is by Nelson Dawson (328). A large oil picture by F. Cayley Robinson (343), "The Ferry," has a touch of the romantic school, strongly pre-Raphaelite in treatment of the aquat plants and lilies which border the river half-screened by the stalks of the latter, gondola, with a swain and his sweethear glides by. The colour is rather in a lo key, which the white canvas frame intensi fies. Leopold Rivers's "Village Street (338) is picturesque and quiet in sent ment; and we notice clever studies b Stuart Lloyd (348) and J. L. Pickering (352 Edwin Ellis's large and powerful seascap "The Kingdoms of the Sun" (363) is in oi Mr. Ellis has this time abandoned headland and coasts, and given us a wide expanse sea, strong and deep in its blue-reflectin mass of white clouds, traversed by a darke one. Imagination may see in these luminou masses of vapour the forms of angels, an the darker cloud that of a dragon; but th motive was to portray the solitary grandeu of sky and sea. The title is indeed a imposing one, and the painter has ver cleverly depicted the effects of bright light the sun's rays pierce the luminous cloud and are reflected in the blue sea. Th shadows of the cumuli are well painte and the whole is a masterly conception light and colour. "Amries Garden," b A. Birkenruth, is a subtle piece of impres sionism, the girl in white among the lilie is prettily conceived. Frederick Jackson "Launch of the Lifeboat" is a fine study coast life; movement in the group and th colour are admirable. Nice colour, too, i seen in Harry Van der Weyden's "Conwa River," in A. Kinsley's "Late Autumn, and dramatic power is shown in W. A Pike's "Too Late," a lady arrived to see onl the death of her lover, who has just fallen i a duel. The group of figures are clever i drawing, but the distant figures look a littl out of scale. In the other rooms, we notic a strong piece of colour in Flora M. Reid' "Step by Step;" a clever, small study b W. H. Pike, "Hunted Down" (486). E. M Bakewell has an interior of St. Augustine' Kent (515); G. Holmes a vigorous land scape in the New Forest (518); Bertra Priestman a touching incident, delicate i colour and drawing, "Parted"; and we ca also mention with approval, Davidso Knowles' "Fading Day" (576), and som works by R. W. A. Rouse; and a weir subject, "La Sorcière—Brittany," by G Sherwood Hunter. Mr. Charles Marsha (28) sends a clever study of the head an shoulders of a woman, well modelled an painted. One thing to notice in this rathe unequal collection are the large number white picture-frames and glazed oil-picture a craze which might be carried easily to a excess. Mr. Ellis's great landscape, fo example, has a wide, plain frame of ston colour, with a gilt margin inside. Th contrast is not ill-judged.

NONCONFORMIST CHURCH BUILDING.*

By James Cubitt.

CHAPTER III. (*continued*).

3. Architectural Style.

BY those who are neither architec nor architectural students, the wo "style" is often misunderstood. If, f instance, they see a church with a nav and aisles, they say it is "in a differe style" from an aisleless one or a poly gonal one, and if they see a tow finished with battlements and a flat roo they suppose it must necessarily be in different style from one which is crowned b a spire. It is quite possible, however, every tyro knows, for all these, and a mult tude of equally diverse designs to be carri out in one and the same style: just as it possible for the same design to be successive

* All rights reserved.

lated into a great variety of styles. e same melody may be transposed into keys, and many very different tunes be played in one and the same key.

le, therefore, is quite a different thing design. Design is the essential under- idea of a building, which settles its form, composition, and grouping. Style rather with the subordinate details. gn is the thought; style is merely the iage in which that thought happens to pressed. Or, otherwise, design is the and style the clothing. Design is, fore, a more vital and essential thing style, and if the design of a building be the particular style adopted is a matter condary, though still of considerable, rtance.

this is universally recognised now. A ation ago it was otherwise; style was studied to the exclusion of all beside. -called "battle of the styles" was g, and the Greek style, the Italian the Romanesque style, the Early c, Middle Gothic, Late Gothic, and issance styles all had their champions. has shown that very good buildings, ery bad buildings, can be produced in ese styles, and in many more. The tle of the styles" has, therefore, prac- y ceased, and the question now is not uch "What style does an architect ?" as "What does he make of it?"

is not well, then, for those who con- ate the erection of a church, to pick me particular style, and to make it a tion that designs shall be in that style, no other. Yet in choosing between in different styles, it is worth while to in mind that, with equally substantial onest materials, some styles will be more economical than others. With roviso, the Roman style, with its por- and pilasters and its immense cornices, prove more costly than most of the eval or Renaissance ones; and from ause it has happened that where the n style has been insisted on for Non- mist churches, it has rarely got beyond ody in stucco. The English variety manesque, again (commonly known as an), needs great massiveness to bring s true character, and this massiveness h inconvenient and expensive. This k, however, does not apply to the r and more refined types of Roman- which are found on the Continent, and have many points of value for modern ses.

se varieties of Gothic, again, which a very lofty, vertical, and aspiring ter do not adapt themselves well to ied churches, in which the windows he columns are usually short, and hich a horizontal tendency is the l result of the conditions. The earliest or "Transitional" Gothic, its nearly round arches, and the Gothic, with its flat, four-centred are much more accommodating in espect, and so are also the refined ies of Romanesque above referred to. rick buildings, there is much to from the Late Gothic and Renaissance architecture of Holland and Belgium, t less, perhaps, from that of Norfolk, , and Essex.

course, whatever style is adopted, it be followed consistently. The reason is not reverence for precedent, but to harmony. Though we can scarcely oo much originality, it should never originality of ignorance, and only who have a thorough knowledge of a re likely to succeed in adding fresh s to it, when they venture beyond its g limits.

ly, it is to be remembered that styles of fashion, and ornaments go out of ; but that good proportion and beauty eral form never go out of fashion. Imagine all the decorative details of an architectural work removed: if it was really admirable, there will still remain a beautiful design; but if it was commonplace and weak, there will only remain a shapeless mass of haphazard building. Hidden under the finery that happens for the time to be in vogue, this shapelessness may pass unnoticed for a while. But some day people will be tired of that particular sort of finery, and then they will only see the formlessness of the building, aggravated by its unfashionableness. It is not so with the works whose pervading idea is a fine one. These will take their place with all that is really excellent, and, after being in fashion, and out of fashion, they end at last, like the masterpieces of art, by being permanently set above fashion.

4. ACOUSTICS.

The theory of sound has been pretty well worked out; but the difficulty lies in applying it to the endlessly varying sizes, shapes, materials, and details of different buildings. It is not so much that the principles of acoustics are unknown, as that the working out of their results in any but the very simplest cases forms too complicated a problem for practical solution. Some writers on the subject, though not usually the scientific ones, profess great faith in strict numerical relations between the length, width, and height of an interior. They would have us believe, for instance, that if a building is 80ft. long, 60ft. wide, and 40ft. high (or if its length, width, and height are other multiples of 4, 3, and 2), it is sure to be successful for speaking in. Practice, as might be foreseen, does not support this fancy, and in the case supposed everything would really depend on the materials, and on the treatment of the internal surfaces. Moreover, the taking away of 2ft. or 3ft. either from length or width of such a building, which on this supposition ought to destroy its acoustic merits altogether, is, in fact, more likely to improve them. And, again, the principle, such as it is, becomes unworkable when one has to apply it to any but a plain, oblong room with a flat ceiling, a room which, of all places, is apt to be the worst for speaking in. What, for instance, are we to consider the length, and what the width, of such a plan as A or K or L, and at what points must they be measured? Yet such plans as these are incomparably better, as regards acoustics, than the plain oblong which the hypothesis presupposes.

But, on the other hand, a building which is to be successful for speaking in must have all its dimensions within certain *general* limits, regulated by the distance to which an average voice can be distinctly heard. Sir Christopher Wren considered this distance to be at least 50ft. in front of the speaker, 20ft. behind him, and 30ft. on each side. This is doubtless, as regards the length, a very moderate estimate, and might fairly be increased by 20ft. or more. At the Metropolitan Tabernacle, Newington, which is 80ft. wide from wall to wall, and 150ft. in extreme length, internally, an exceptionally good voice is audible throughout. In this case there is, in the upper part of the building, a length of nearly 120ft. in front of the speaker. On the ground floor and lower gallery, however, the extreme distance from him is only about 100ft.

In buildings of a length like this, the chief difficulty is to conduct the sound to the further end, and by all practicable means to prevent its being lost and deadened. For this purpose, wooden linings to the walls have been employed, and a ceiling semicircular in section. Echoes have also to be carefully guarded against, especially from the end facing the speaker. But, in places of a smaller size, and of moderate height, means for conducting sound are not required, and echo and reverberation are the real dangers to be feared. In an interior where the furthest seat is not more than 60ft. or 70ft. from the minister, everybody may be considered within direct range of his voice. Wooden wall-linings would do more harm than good, but careful study is needed to prevent the voice from being reflected back.

Echo, and reverberation, which is only an echo, or series of echoes, within too small a compass to be clearly heard as such, come mainly from even and unbroken surfaces. The surfaces may belong to either walls, roofs, or floors. Echoes from a floor, which are very common, are much lessened by chairs or pews, and destroyed by the presence of a full congregation, and by the use of carpets, cushions, &c. These, therefore, are comparatively harmless. The troublesome echoes are those from walls, and roofs or ceilings.

A flat, unbroken end-wall, facing the pulpit, is pretty sure to reflect sound unpleasantly. This fact is so well known that an end gallery is often put in, less for its utility than with a view of preventing this evil. Any scheme, however, which will break the wall surface up into projections and recesses will answer the same purpose, and perhaps in a more architectural way. The corners of an oblong building, too, are great lurking-places for echoes, particularly if the building is destitute of columns. For this reason, corners of this sort are sometimes cut off obliquely, and at other times are broken up with projecting piers, which will have the same effect in a different way. The sides of deep transepts, again, facing the speaker, are likely to act as a flat end-wall does if proper precautions are not taken. And if, as occasionally happens, the building narrows, even a very little, from one end to the other, or, in other words, is slightly wedge-shaped, there will be much danger of reverberation from the side walls, if the pulpit is put at the wider end. With a pulpit at the narrower end, wedge-shaped buildings have the reputation of being acoustically good.

A curved wall facing the speaker is commonly as bad as, or worse than, a flat one, provided, of course, that it is not effectually broken up by projections or recesses; and the same thing may be said of a polygonal one. It has been assumed, so far, that the building is without columns. For though columns when ill-placed cause much obstruction to sight, they do make considerable atonement for this fault by breaking up and doing away with echoes. Moreover, it is quite possible to get the good from them without the evil, although, on the other hand, with unskilful treatment, it may happen that the evil remains without the good. The same principles that apply to walls apply to roofs and ceilings. All planes that face the speaker should be thoroughly broken up, and no flat or concave surfaces should be allowed in this position. The right angle between a wall and a flat ceiling is usually as bad for sound as the right angle between two walls, and should be got rid of in analogous way. An angle at the ridge of a roof also leads to confused echoes, unless the pitch of the roof or ceiling be extremely low. Very obtuse angles are not objectionable. Anything like a large internal dome should be greatly broken up by ribs, coffers, or similar features, or it will be likely to reflect the voice like a concave mirror. And internal roofs or ceilings should not be too high. A lofty space behind the pulpit is particularly bad, unless it has an open or closed screen across it, or is occupied by an organ.

REMOVAL OF SNOW FROM TOWN STREETS.

SNOW as it lies when fallen measures, according to the state of the atmosphere at the time, from 12 to 8 times the depth of

water into which it melts. In very dry states of the atmosphere it measures even more than 12 times its depth of water. But by the time it is removed it has generally become compressed, either by its own settlement or by traffic over it, and in this condition it may be more properly taken at 8 times its depth of water. A cubic foot of water being 62½lb. weight; a cubic foot of snow at the time of removal is thus 7·8, or say 8lb.

It has been the usual practice to remove snow from the streets of towns by carting it away, at great expense, or to let it lie upon the streets, other than the main streets of traffic, to the great inconvenience of the inhabitants. But there is usually a great outcry and complaint against the streets authority when they venture to let the snow lie in any street while they remove it from another, and they are often at their wits' end, as it is said, to know what to do or which way to turn to satisfy everybody. Snow is sure to fall every year, and it is usually as frequent as it is certain, every winter, yet when it comes it puts the street authorities into commotion. They have horses and carts to look up and men to employ in unusual numbers all at once, and the expense of clearing the streets has been frequently enormous. A better way, if it were possible, would be to melt the snow *in situ*. The following are but a few instances of the many which have occurred. On one occasion there fell a depth of snow estimated at 12in. in general depth over the one square mile of the city of London, the area of the carriageways being 468,950 square yards, and of footways 328,608 square yards—together 797,558. The streets, courts, and alleys of the city measured at the same time 46 miles. To clear the snow from this area there were employed, in addition to nearly 80 carts belonging to the Commissioners of Sewers, about 300 extra carts and horses and 600 men, over and above the ordinary staff of scavengers and street-cleaners, numbering between 300 and 400 men and boys. The snow, so far as it was tolerably clean and free from the refuse underlying it, was carted to Blackfriars Bridge, and there thrown into the Thames. The remainder was carted to vacant ground to which the Corporation had access. The late chairman of the Metropolitan Board of Works stated that on the 117 square miles of the metropolitan area there fell, in one storm, 8¾ million tons of snow. Somebody else estimated the weight at 7½ million tons, taking the depth at 12in., and the corresponding depth of water at 1in.

In the parish of St. George, Hanover-square, there were from 250 to 300 men working night and day with snow plough, removing 1,800 loads, equal 4,500 cubic yards daily. One great difficulty was the absence of places conveniently situated for its disposal, the whole having been carted to the Thames, at an expense of nearly £1,000. The area of the streets only from which the snow was removed was more than a million square yards. Including the roofs of houses the quantity of snow removed was at least 400,000 cubic yards. To remove this in ten days 4,000 horses and carts, it was said, would be required each day, and would cost at least £35,000, or an extra rate of 6d. in the pound. A fall of snow at Leeds, removed by carting it away, took three days and nights continuous work, not only of the regular staff of 150 men and 40 horses and carts, but 150 extra men with 20 additional horses and carts, were at once set on. These continued all day and were relieved at night by 168 men and 50 horses and carts, continuing all night. The next day 200 extra men were employed, with 100 horses and carts. It took 150 men and 50 horses and carts 8 hours to clear Briggate alone, an area of 11,000 square yards. One of the difficulties here also was to find places where the carts could be emptied. The snow was mostly carted to the river. The report of Colonel Haywood to the City of London Commissioners of sewers in 1881 was that one fall of snow was 8in. to 9in. in depth, and that before compression there were 500,000 cubic yards on the entire area of the City, of which about 133,000 cubic yards fell upon the public ways. The 350 men and boys employed by the Commissioners began work on the snow at its commencement, and 233 extra hands were taken on during the day. During the night the men rested; but on the second day a total number of 1,287 men and boys, and 288 horses and carts were employed. The work was carried on night and day for eight or nine days.

The average number employed was 1,429 hands, 502 horses, 490 carts. The extra hands were nearly all adults, and were engaged for six hours and then paid off, that being the amount of continuous labour that could be done in the snow. The rate of pay was 6d. per hour for the first seven days, and afterwards 4d. per hour. The greater part of the snow was carted to London Bridge and Blackfriars Bridge, and thrown over the parapet into the river. Attempts were made to melt the snow by sprinkling upon it rock salt, but failed, owing to the severity of the frost.

On the occasion of a previous fall of snow, experiments were made in melting by steam. For this purpose, the boiler of a 10H.P. portable engine was taken to a piece of vacant ground near the Holborn Viaduct. A wooden trough was provided, and placed near the engine. It was 7ft. 4in. long, 2ft. wide, and 2ft. deep. At the bottom of the trough was a hole for the escape of water. Six inches above the bottom of the trough were four lines of 1¼in. pipes, connected by a transverse pipe with the boiler. The pipes in the box were perforated with holes 1¼in. diameter, 1½in. apart. The experiments extended over five days, which included getting up steam. The mean pressure in the boiler was 45lb. per square inch. Snow was brought in carts and shot down near the engine, filled into a measure of 1 cubic yard, and thrown into the trough. It took three men to keep the trough constantly full of snow. The quantity melted in five days was 204 cubic yards. As the snow was thrown into carts from the streets, and further compressed by filling into the measuring boxes, each cubic yard experimented upon was probably equal to 3 or 4 cubic yards measured on the ground after the fall.

After the first day, the snow became mixed with street refuse, and, at times, the steam had to be shut off while the bottom of the trough was cleared of the mud. The total cost per day for the five days was:—

	£	s.	d.
Hire of engine, including attendance and fuel	1	15	0
Three men filling, at 4s.	0	12	0
Cost of water	0	10	8
	£2	17	8

which is at the rate of 1s. 5d. per cubic yard.

This does not include the cost of filling the carts and bringing the snow to the spot, nor the three men measuring the snow, nor the cost of bringing or removing the engine. If the cost of these were added it would be 1s. 7d. per cubic yard, and if the pay of the three men measuring be added, it would be 1s. 10½d. per cubic yard. There were defects in the construction of the trough; but in any case the cost of melting the snow by steam in this manner would not be less than 1s. 3d. or 1s. 4d. per cubic yard.

A gas apparatus was tried, consisting of a series of gas-burners, by which coal-gas is largely mixed with air and then consumed, the burners being covered with a series of corrugated-iron plates with iron flues, which distribute the heat in the chamber in which the apparatus is fixed. The apparatus was placed in the manhole chamber of the entrance to the sewer in Fore-street, a corner of New Basinghall-street. The was generally of the same character as melted by steam, but perhaps more pressed, and probably more dirt with i was not in this case placed in mea before melting; but the number of loads brought to the side entrance o sewer was counted. The quantity mel 32 hours was 285 cubic yards, or 89 yards per day of 10 hours. It took men to keep the side entrance of the sufficiently charged with snow to utili full power of the apparatus. The ga sumed in 32 hours amounted to 20,7 The price was 3s. 9d. per 1,000ft.; but the gasworks of a town belong—as th in many towns—to the municipal auth it would not be charged at more th cost price, say 2s. per 1,000ft. At th the cost of gas would be £2 1s. 6d. labourers at 5d. per hour, £2 13s. 2 gether £4 14s. 8d., or at the rate of 4 cubic yard of snow melted. But t must be added a proportion of the fir of the apparatus and the alteration side entrances of sewers for its adap The apparatus would cost about £3 the adaptation of each side entranc Each season, also, the apparatus be removed and stored, and perhaps re and taking all contingencies into ac the cost of melting snow in the comp state in which it would be brought melting place, would be 6d. or 7d. pe yard.

Falls of snow 2in. or 3in. in depth materially inconvenience the road traf beyond 3in. it becomes a hindrance. of 4in. deep, measured as it lies, wou for the entire public way of the London about 77,697 cubic yards, o about 36,365 would be upon the ma of street.

A fall of 6in. deep gives about cubic yards, of which about 54,548 w upon the main lines of street. If yards, measured as it lies, are carte as 1 cubic yard, a fall of 4in. wou 12,122 cubic yards for the main stre 25,899 for the whole city; and a fal would give 18,182 cubic yards for th lines of street, and 38,848 for the who These quantities do not include th thrown on to the public ways from t of houses.

THE SYMBOLISM AND I GRAPHY OF EARLY AND ÆVAL CHRISTIAN ART.—X

By George Ashdown Audsley, F.R.

(Author of "Handbook of Christian Syn and several works on Architecture and

Third Subject.

Text.—"And God said, Let there be ment in the midst of the waters, and le the waters from the waters. And God firmament, and divided the waters wh under the firmament from the waters w above the firmament: and it was so. called the firmament Heaven. And the ev the morning were the second day."

THE artist of the mosaics at Mon treated this subject with con force, and in the very simplest manner He represents the Creator, seated circular orb or disc, moving as it w the waters, and with His right hand forth, apparently in the act of raisi thing up or moving something—th dividing "the waters which were u firmament from the waters wh above the firmament." The firm represented by the lower half of a ring, within which is shown a mass divided from the water beneath on Creator is apparently moving. centric circles of blue tints within t circular feature are intended, in t

lic methods of the Middle Ages, to
s heaven.
artist of the series in St. Mark's, at
, appears to have experienced some
xity over the events of the Second
and has devoted two pictures to them.
e first he has depicted the youthful
r, bearing a sceptre, and accompanied
o angels; before Him is a dark globe
midst of waters. This evidently is a
ring of the words, "Let there be a
nent in the midst of the waters."

Fig. 54.

e second subject the Creator is separ-
the waters. The dark globe appears
e side, whilst the waters, on the other
are divided by a piece of land which is
form of a cross. This is by no means
ccessful a rendering as that at Monreale.
might reasonably be expected, the
s of the Second Day of the Creation
never favourite subjects with the
eval artists. Art failed in representing
the mind could not comprehend. All
ould be done was to depict two masses
ater divided or separated in some
er; the figure of the Creator appearing
commanding their division. Art, how-
aided by imagination, could go no
er here.

Fourth Subject.

T.—"And God said, Let the waters under
eaven be gathered together unto one place,
t the dry *land* appear: and it was so. And
alled the dry *land* Earth; and the gathering
er of the waters called he Seas: and God saw
t was good. And God said, Let the earth
forth grass, the herb yielding seed, and the
ree yielding fruit after his kind, whose seed
self, upon the earth: and it was so. And the
brought forth grass, and herb yielding seed
his kind, and the tree yielding fruit, whose
was in itself, after his kind: and God saw
was good. And the evening and the morn-
ere the third day."

e difficulties which met the mediæval
s, at almost every turn, in their essays
forth the earlier events of the Creation,
not repeated in connection with the
s of the Third and three succeeding
. They had merely to represent, in
graphic manner and under simple con-
ns, objects which surrounded them in
daily lives, and were perfectly familiar
eir eyes—objects easily represented in
ing, mosaic-work, and carving.
inspection of the accompanying illustra-
Fig. 55, will show with what simple
and directness of purpose the Monreale
t has set forth the events of the Third
The figure of the Creator, in the
l attitude, seated upon the zoned globe
se, and with right hand stretched forth,
troduced on the left of the subject. In
t of the Creator is what may be looked
n as an arm of the sea running into the
land, its shores clearly defined by dividing lines. The feet of the Creator rest, for the first time in this series of subjects, upon dry land; and close to them grass is depicted as springing from the ground. Beyond the water are represented trees of quaint and curious formation; and in the background is shown what is evidently intended for a rocky mountain. The whole treatment is of the simplest character. In the first place, the waters are gathered together and confined, and the dry land is shown: and, in the second place, the newly created grass, the herb yielding seed, and the fruit tree yielding fruit, are depicted as if springing from the earth at the Creator's command.

In the St. Mark's series, the youthful figure of the Creator, accompanied by three angels, is depicted calling into existence the grass, herb, and fruit trees. The apple tree is clearly indicated.

There is not any great diversity of treatment possible in the artistic representation of the events of the Third Day of the Creation. Water, dry land, and vegetation are all the artist has to depict, arranged in some simple manner in relation to the figure of the Creator. The chief diversity is to be found in the portraitures of the Deity, as previously pointed out.

Fifth Subject.

Text.—"And God said, Let there be lights in the firmament of the heaven to divide the day from the night; and let them be for signs, and for seasons, and for days, and years. And God made two great lights; the greater light to rule the day, and the lesser light to rule the night; he made the stars also. And God set them in the firmament of the heaven to give light upon the earth. And the evening and the morning were the fourth day."

It is somewhat remarkable that of all the greater acts of Creation, that of calling into existence the heavenly bodies—the sun, moon, and stars—should have been entirely omitted from the series of subjects in the Cathedral of Monreale. It is not an easy matter to account for this missing link; for we can scarcely attribute it to any difficulty connected with the subject itself. It would be a very simple matter, following the methods adopted by the Monreale artist in his other subjects, to fill up the hiatus in his series. We can imagine the figure of God the Creator, seated on the zoned orb, with feet resting either on the earth or on clouds, and with right hand elevated towards the firmanent of heaven; and appearing therein representations of the sun, moon, and stars, created at the word of the Deity.

In the series of subjects in St. Mark's vestibule, this Day is very graphically set forth. The youthful figure of the Creator is depicted standing, attended by four angels: before Him is a globe, representing the firmament of heaven, studded with the sun, the moon, and numerous stars. This treatment is simple, and accords with that which obtains in the subject setting forth the creation of light and its subsequent division from darkness, alluded to in our remarks on the second subject, or the First Day.

In the Greek "Guide to Painting," we find no instructions for depicting any of the acts or Days of Creation prior to the creation of Adam; accordingly, we are without direct and written directions respecting the accepted Greek methods of setting forth the creation of the heavenly bodies.

In the West, artists showed a very general preference for the subject under consideration; and they frequently depicted the Creator in rather undignified attitudes. The Deity is represented, in some instances at least, as if undergoing considerable exertion, with extended arms, and holding, or supporting, in His hands the sun and moon. Speaking of this subject, Lady Eastlake correctly remarks:—"Another subject which also obtained the artist's preference was that of the Creation of the Sun and Moon. Classic impersonation lent its help here. An example from the 10th century is seen in a miniature in the British Museum (Cotton, Claudius, B. iv.), where the Creator appears in the most animated action, as if dancing, while He extends His arms to call into being two orbs, which are represented as bust-length figures, with torches, and drawn, both exactly alike, by red oxen. The action of the extended arms calling the sun and moon into existence on each hand, is a composition by no means unfrequent in miniatures (one may be observed in a bible at Brussels, in the Library

Fig. 55.

of the old Dukes of Burgundy, where almost the same animated action is preserved in the Creator), and was thus handed down to Michael Angelo, who adopted it in the Sistine Chapel ceiling. The same incident occurs in the mosaics of the cupola in the Baptistery at Florence."

(To be continued.)

"BUILDING NEWS" DESIGNING CLUB.

AWARD OF PRIZES, SESSION 1890-91.

THE following are the results of the several competitions held during last session by the members of "our" Designing Club, which has now completed its 14th year, seeing that we inaugurated it in January, 1877, since which time much good work has been accomplished, as published results bear witness; and not a few of the members who did so much to contribute towards that success have since taken good positions in the profession, and are now busily occupied in lucrative and artistic engagements.

During the session for 1890-91 the subjects set were eight in number, and were thus competed for:—

A.—A Small School of Art for a Village.—1, "Spider"; 2, "G." in a horseshoe; 3, "Multum in Parvo"; 4, "M.P."; 5, "Walmer."

B.—A Small Detached Country House.—1, "Philomath"; 2, "Forward"; 3, "Syphax"; 4, "Red Lion"; 5, "Granite City."

C.—A Mountain Church.—1, "Multum in Parvo"; 2, "Spectre"; 3, "Red Lion"; 4, "Syphax"; 5, "Old Michael."

D.—A Country Railway Station.—1, "Eighteen '91"; 2, "Charl"; 3, "Flint"; 4, "Syphax"; 5, "Multum in Parvo."

E.—A Village Free Library.—1, "Multum in Parvo"; 2, "Spectre"; 3, "Eighteen '91"; 4, "Black Prince"; 5, "Albyn."

F.—An Architect's House and Offices.—1, "Thinlin"; 2, "Eighteen '91"; 3, "Spectre"; 4, "G." in a horseshoe; 5, "Streona."

G.—A Country Gentleman's Stables.—1, "Eighteen '91"; 2, "Thinlin"; 3, "Flint"; 4, "Spectre"; 5, "Philomath."

H.—A Tennis Club Pavilion and Summer House.—1, "Eighteen '91; 2, "Spectre"; 3, "Albyn"; 4, "Smilash"; 5, "G." in a horseshoe."

"Eighteen '91" therefore comes first (Mr. Heber Rimmer, 6, Abbey-square, Chester); "Multum in Parvo" wins the second prize (Mr. L. Kitchen, 48, Thompson-street, Ardwick, Manchester); "Spectre" ranks third (Mr. C. E. Hutchinson, 20, Keppel-street, Russell-square, W.C.); hon. mention is awarded to "Thinlin," who obtains the fourth place; "Philomath" and "G." in a horseshoe (Mr. A. F. Milligan, Liverpool, and Mr. A. W. Newman, Bloomsbury-square, W.C.) are equal in points for the fifth place; and "Flint" (Mr. M. J. Hay, Leith, N.B.) and "Syphax" (Mr. L. E. G. Collins, Tonbridge) are also ties for the sixth position. The remainder we cannot further classify.

The prizes thus awarded are £10 10s. for the first, £5 5s. for the second, and £3 3s. for the third best series of designs.

CONDITIONS FOR SESSION 1891—1892.

The following list of rules must be observed in every particular by all competitors:—

1. Drawings to be sent in 28 days after the publication of the list of subjects.

2. Usually two subjects will be given every month, from which a competitor may choose.

3. The drawings to be executed in firm black lines on white drawing-paper, in sheets of the absolute size of 22in. by 14in., with no washes or tinting in colour whatever. Outline to be the first consideration; but drawings may be slightly shaded with shadows executed wholly in line. Sectional parts to be shown in ruled "hatching" or blocked in. The scale to be used will be given with each subject.

4. Drawings to be forwarded unmounted, by post, care being taken to roll the short way of the drawing, as packages over 18in. long are not transmissible by Book post.

5. On entering the class (which may be done at any time), each competitor is required to furnish his name and address, which must be written legibly on the back of each drawing, as a guarantee of good faith, the *nom de plume* the author intends to adopt being boldly marked on the front of each separate drawing.

6. Prizes of £10 10s., £5 5s., and £3 3s. will be awarded to the best series of designs, such series not to consist of less than six subjects. Our decision to be final.

7. Before awarding the prizes any contributor will be expected to furnish proof, if necessary, as to his age, and the time during which he has been engaged in professional pursuits, though no candidate need be strictly an architectural student.

8. We reserve the right of arranging the drawings for publication in any manner we deem necessary.

9. A critical notice of the designs sent in of each series will be given in an early issue following the receipt of the drawings.

FIRST LIST OF SUBJECTS.

A.—*A Small Convalescent Home* on a detached site at the foot of a cliff facing the sea. The frontage to be 100ft. long, and measuring 60ft. deep, with a fall from back to front of 5ft. The building is to set back 15ft. from the frontage line. Accommodation to be provided for twenty-four patients, equally divided among the sexes. The day-rooms and dormitories are to overlook the sea, and have open verandahs, reached from a glazed door either immediately out of or adjoining the several rooms. A bath-room, lavatory, cloakroom, and two w.c.'s in each of the two departments, and also a nurse's bedroom commanding the dormitories. The administrative department is to be located in the centre of the block, and is to include a committee room, a matron's sitting-room, a dining hall entered from both departments, a kitchen, and its usual offices. Separate entrances and staircases to be provided. A small turret for bell and clock to form a feature in the design, which is to be treated in red brick and tile hanging, with tiled roofs. Scale 8ft. to the inch for elevations, and 16ft. to the inch for the plans. The block plan may be smaller. Send two plans, two elevations, one section, and a sketch.

Portrait busts of the late Bailie Harris and of his sister, Miss Harris, who gave munificent bequests to further the cause of the higher education in Dundee, are about to be placed, one in the High School for Boys, and the other in the High School for Girls, which benefited greatly by their liberality. The busts have been executed by Mr. John Hutchinson, R.S.A.

HOT-WATER ENGINEERING.—XX.

Supply of Hot Water for Baths and Domestic Purposes.

Low-pressure Boilers.

NEARLY every range which has but one oven has a boiler at the opposite side of the fire, this boiler nearly always being merely of a square cistern shape with a cover; usually it is cast iron. This is termed a low-pressure boiler, the general meaning of the term being that it is a boiler which can only supply hot water at or below its own level. There is, however, another kind of low-pressure boiler which is used with ranges having an oven upon each side of the fire. In this case the boiler goes at the back of the fire, and is boot shaped, as Fig. 68. This boiler, it will be seen, is very

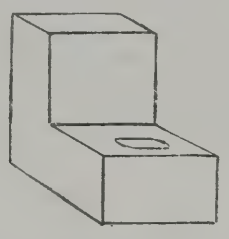

Fig. 68.

similar to a high-pressure boiler, but it has no flues; its contents are heated by the fire which rests against its toe portion (which forms a back to the fire-box). This is quite sufficient to keep the water nearly always on the boil; in fact, the only complaint against these boilers is that they heat too rapidly, and the constant boiling proves an annoyance. This boot boiler is made of wrought plate, and it "furs" very rapidly with hard waters. It must be cleaned out regularly, or it will become fractured, like a high-pressure boiler.

Both descriptions of boilers should be connected with an automatic or self-filling apparatus, particularly the latter, which cannot be filled by hand. The self-supply apparatus, as everyone knows, consists of a small cistern, placed at the side of the range opening, and connected with

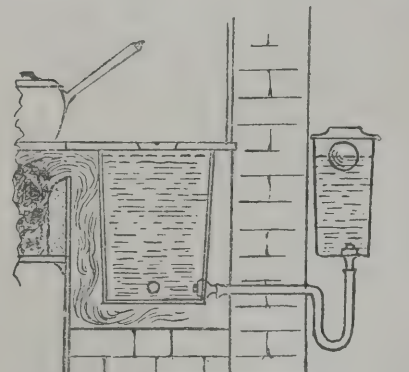

Fig. 69.

the boiler by a short service, as Fig. 69. The cistern is kept supplied with water by a ball-valve. It will be seen that the boiler is kept filled with water by the mere fact that water finds its own level in two or more vessels, whatever their shape or size, provided there is free communication between them. It matters not how small the communicating pipe may be, provided it is clear. The level will be the same in all the vessels alike, whether water be added or withdrawn.

The chief error that is made in fitting up or

connecting these useful little appliances to side boilers is that the level of water is not made high enough. Commonly it is arranged for the boiler to fill up to about 3in., sometimes 4in., of the top, and this leaves the part of the boiler which receives the greatest heat and wear unprotected, and the life of the boiler is greatly shortened. Sometimes it is argued that this space is needed for boiling; but such is not the case. For the actual expansion of the water in being heated, a ¼in. would suffice; but to allow for ebullition it is best to allow 1in. or 1¼in. space. This is ample, for the boiling is never very violent in these boilers.

It has been said that if the water level is low the steam from the water would protect the upper part of the boiler; but this is also incorrect. In the first place, we do not get steam except when the water is actually boiling, and when steam is generated, it is a gas, and in no way moist while at a high temperature. The last illustration shows the water level high, as it should be; and it also shows the flame leaving the fire-box and impinging directly against the upper part of the boiler, as happens with nearly every make of range. In the service between the cistern and boiler is shown the customary dip or siphon (inverted). The use of this is to prevent the contents of the cistern being heated, as was fully explained in an earlier paper.

Sometimes these boilers are made with a neck, as Fig. 70, the object of the neck being to admit of the flame passing across the top of the boiler, and then down the outer side. With these boilers there is a joint just where the neck joins the body of the boiler, and it is usually necessary

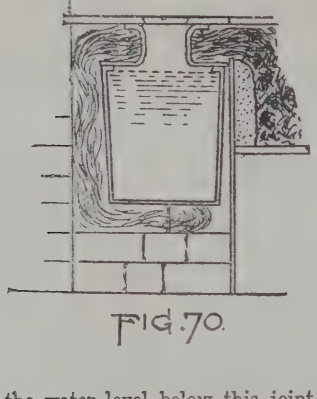

FIG. 70.

to keep the water-level below this joint, otherwise a leakage will, in the majority of cases, occur at this point.

Now every range with a side boiler has the tap inserted at a low point, within about 2in. of the bottom of the boiler. This is very proper, as it permits of all the hot water being withdrawn—in fact, the boiler emptied, supposing it is not connected with a self-filling apparatus. When a self-filling apparatus feeds the boiler, a quite new feature is introduced in the fact that cold water is introduced just as fast as water issues from the tap, and as the cold water enters at the bottom and the tap is at the bottom, what is more natural than for the cold water to flow in and pass across the bottom of the boiler and out of the tap, without disturbing the lighter hot water in the top of the boiler?

This is what really happens, and supposing we have a boiler quite full of hot water, it is impossible to withdraw more than a fourth of it if the boiler is supplied from a feed-cistern. Directly the tap is opened hot water issues; but the very same instant cold water flows in, and it will be found to take a direct passage to the tap, and the issuing water will then be cold, although by inserting the hand at the top of the boiler, the water inside will be found very hot. Properly speaking, when a boiler is automatically fed the tap should be inserted at a high position in the boiler, so as to draw from the top of the water, where it is hottest, and where the heated water will be found so long as any remains in the boiler.

This, however, cannot very well be done, and, fortunately, an easy (but very little known) remedy can be had in putting an elbow and a short upright pipe on the tap inside the boiler, as Fig. 71. This illustration shows the water entering near the bottom, as usual, but instead of finding an outlet at the bottom also, it has to push (so to speak) the hot water up and out, before it can pass through to the tap. This is, of course, all that can be desired. The want of this little arrangement has led to countless boilers being condemned as not getting hot, whereas

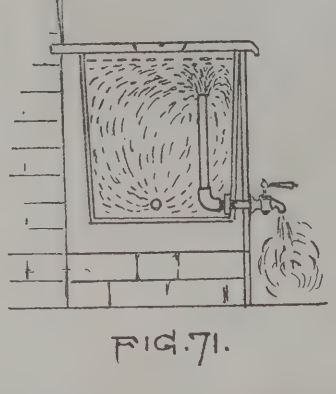

FIG. 71.

they have heated their contents well all the time, but it has not been known.

This means of drawing from the upper part of the boiler is desirable even for poor-heating boilers, as, supposing the contents of the boiler to be part hot and part cold, the hot will be found at top. Let it be noted that this upright pipe in the boiler must not reach too high, for the outflow of water at a boiler tap is always greater than the inflow of water from the ball-valve into the cistern. The pipe should terminate about 4in. below the normal water level. With ½in. and ¾in. taps, an ordinary iron (gas or steam) elbow and piece of pipe will do; but fully half the range taps used are ⅝in., and we have no iron pipe or fittings this size. To meet this difficulty, a brass-founder will make elbows ⅝in. by ¾in., or a ¾in. iron elbow can be soldered on to the nut of the range-cock.

In connecting up a boot boiler at the back of a range fire, a little different procedure has to be followed. Lead pipe ought not to be used for this work, as, it being nearly all situated behind the range, any leakage or trouble would necessitate the removal of the range to remedy it. Iron pipe should be used wholly, or at least for all those parts that come in the range opening.

Fig. 72 shows a boiler with all necessary connections. The boiler is supposed to be at the back of a range fire, and the pipes extend each side at the back to clear the ovens. The supply to the boiler is carried out in a similar manner to that adopted with a side boiler, except that the customary lead pipe should not be used. With this boiler, however, the cistern is fixed so that the water level in the boiler is 3in. or 4in. from the top. This is directly contrary to what was recommended with side boilers; but it is correct in this instance. In the first place, no fire heat comes against the top of the boiler, so that the

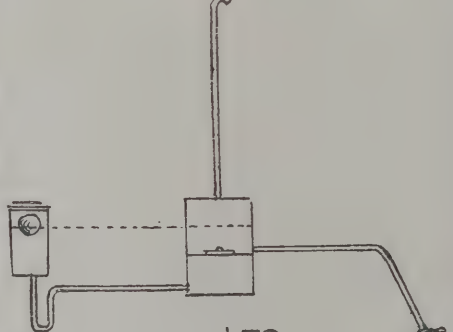

FIG 72

only objection to a low water level in a side boiler does not exist; secondly, with this boiler the water, as a rule, heats very rapidly, and the boiling is furious, and as the steam escapes by a pipe, it is necessary to prevent water entering the outlet, otherwise the escaping steam will eject it, a pint at a time occasionally. The ejected water is thrown into the chimney (as this expansion pipe is not usually taken outside), and consequently would come running down through the covering-in plate and flues of the range. It is therefore necessary to keep the level as low as stated.

The expansion pipe should be 1in., and it extends up about 2ft. above the range top. The upper end must be turned over as shown to prevent falling soot entering it. Sometimes when a fitter prefers to have his boiler fill higher than just recommended, he carries the expansion pipe up higher, to prevent water being ejected, but this is never a success unless the boiler happens to be somewhat poor in its heating capacity.

The draw-off service can be taken from either side or the back of the boiler, but upon the principle of drawing from the top of the water and away from where the cold water enters, the draw-off service should be connected about 4in. to 5in. below the water level—that is, about 8in. from the extreme top of the boiler. Both the draw-off and the cold supply services should be of good size, as these pipes fur up very rapidly. ¾in. pipe will become choked in a very short time in a busy house with a rapid-heating boiler, and 1¼in. should be used as a rule. A ¾in. tap is as that is needed, the pipe being reduced to take this. It is close to the boiler, where the furring is worst in these pipes.

It happens quite frequently that when a close top boiler—as these low-pressure boot boilers are—is used, a wish is expressed to have a service

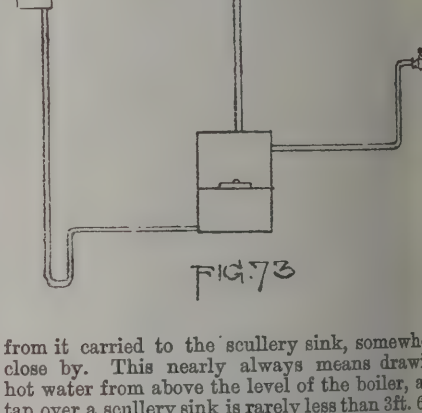

FIG. 73

from it carried to the scullery sink, somewhere close by. This nearly always means drawing hot water from above the level of the boiler, as a tap over a scullery sink is rarely less than 3ft. 6in. high. This is quite possible; but unless any precautions are taken, there may be perpetual annoyance experienced.

This is done by putting the supply cistern, say, 2ft. higher than the tap, and which will cause the water level to be up the expansion pipe some little distance, as Fig. 73. When doing this it is still desirable to connect the draw-off service into the boiler, and not take it from the expansion pipe. A better flow of water is insured this way. The particular trouble experienced is caused by the steam ejecting water from the expansion pipe in its efforts to escape, and as this pipe may have a fair quantity of water in it, there is no tolerating the matter. This is usually obviated by making the expansion pipe of unusual height, say 20ft. above the water level, but this is not always successful. This is, however, greatly assisted by putting a double bend in this pipe, as shown. This double bend is placed some 6ft. to 10ft. above the water level and its object is to arrest or retard the upward passage of the water thrown up by the steam.

CONTRACTORS' ESTIMATES FOR MERSEY TUNNEL.

THE Mersey Tunnel crossing of the Vyrnwy water main, which has been so disastrous to the contractors who undertook to construct for the Liverpool Corporation, is the subject of three lengthy reports to the water committee

PRINTERS' ALMSHOUSES, WOOD GREEN.

it body. The first is from Sir Benjamin ker, who states that, while the soil to be nelled through at Fidler's Ferry is more ying in character than that of any similar dertaking in this country, or in America, thin his experience, the great delays have en due, not to any inherent impracticability in undertaking, but are consequent upon the eral contractors underrating the difficulties d making an insufficient provision in the way of nt to overcome them. He recommends that the esent scheme should be carried out with certain difications in the shield. Mr. S. F. Deacon, the gineer of the Vyrnwy works, points out that the ginal proposal was to lay the pipes in the l of the Mersey, but that under pressure from ipowners the Board of Trade compelled the poration to construct a tunnel. The work s commenced in April, 1889, but the then ntractors, Messrs. Monk and Newell, deter- ned the contract in December, 1889, only the fts having been sunk, and a fresh contract s entered into with Messrs. John Cochrane and ns, of Westminster, for driving at a higher el than that originally contemplated, and these ntractors now in turn seek to be relieved of eir undertaking. Mr. Deacon adds that the ne required for the completion of the work not likely to be unreasonable, and that s belief is confirmed as to the practica- ity of the undertaking without immoder- e cost. It will be remembered that an bitration has been held with reference to e amount due to Messrs. Monk and Newell der their contract, which went against the verpool Corporation. It will also be fresh in e memory of our readers that Mr. John chrane committed suicide a few weeks since consequence of worry. A third report is made the chairman and vice-chairman of the water mmittee of the corporation. They state that hereas Messrs. John Cochrane and Sons under- ok to complete the tunnel for £12,000 plus the st of fresh castings and ironwork (estimated at ,000) over and above those taken over from essrs. Monk and Newell, they expended up to e 24th September last in all £18,228 0s. 10d., d received under the engineer's certificates ,303 7s. 9d., thus showing a sum of £13,924 13s. 1d. as the amount which they are out of pocket in expenditure on the works up to the 24th September last. As a set off against this loss is the retention money and the cost of castings on the ground, in all £2,117 10s. 3d., which, if paid to the contractors, would reduce their loss to £11,807 2s. 10d.; but the loss would, on the other hand, be further increased on the re-sale of plant. The work done by the contractors comprises the Lancashire shaft and 185ft. of tunnel, and on the Cheshire side the shaft has been sunk to the required depth. The work remaining to be done is the completion of the shafts and the driving and the lining of 620ft. of tunnel. The contractors have informed the committee that they are not in a position to carry out and complete their present contract, and desire to be relieved therefrom, and make an arrangement with the corporation. Two questions therefore arise—first, whether it is desirable for the corporation to endeavour to complete the works according to the present scheme; and, secondly, if it is desirable to do so, whether the work can be carried on by the present contractors more expeditiously than by some other contractors. The chairman and vice-chairman recommend, in accordance with the engineers' reports, that the works be completed according to the present scheme, and that the present contract be determined, the contractor to assign the retention money, deposit, and all plant, castings, and ironwork now on the ground, the corporation to pay the contractors £1,041 13s. 4d. as the value of all ironwork on the ground but not fixed, and the actual cost of all work done since September 24. They further recommend that a new contract be entered into with Mr. Harry Herbert Cochrane and Mr. Arthur Hamilton Cochrane (the surviving partners of the firm of John Cochrane and Sons) that they shall complete the works so far as possible with the present staff, Mr. Arthur Cochrane to give personal supervision, the corporation to pay the contractors the "prime cost" of all work done by weekly or fortnightly payments, and to provide all additional ironwork and plant. If the contractors shall complete the works to the satisfaction of the engineer, then the corporation shall pay them £4,800, and in case the expenditure incurred from the 15th October on the works included in "prime cost," and implements and materials (other than castings and ironwork), shall amount to a less sum than £8,428, then the corporation shall also pay the contractors the difference between the two amounts.

PRINTERS' ALMSHOUSES, WOOD GREEN.

THE central block only of these buildings was erected in 1847, from the design of the late Mr. W. Webbe, a well-known architect of his time. It contains a board room and residence for 12 married couples on two floors. In 1870 the late Mr. Henry Wright, of Kingston, left a sum of £2,000 for the erection of a wing in memory of his wife and mother, and a further sum of £1,000 was subscribed by the friends of the institute, which enabled two wings to be built, accommodating six widows and eight married couples respectively. A space was still left for four houses (eight inmates), and these have been erected, and opened last week by the Duchess of Albany. The architect of the wings in 1870 and the recent additions is Mr. Charles Bell, F.R.I.B.A., of 3, Salters' Hall-court, E.C. The builder in the former case was the late Mr. W. Henshaw, and in the latter Mr. John Mills, of Blackfriars. The buildings are very compact, in the Tudor style, of red brick and Bath-stone dressings. Our illustration shows the very effective entrance gateway with wrought-iron gates by Messrs. Lockerbie and Wilkinson, of Birmingham. The total cost of the wings, including external repairs to the old building, is about £2,500.

The town council of Guildford have received 152 applications for the appointment of borough surveyor, rendered vacant by the retirement of Mr. Henry Peak. The testimonials have been referred to a committee, who will make a selection of six.

It has been decided to apply for a faculty to restore the interesting parish church of Sevenhampton. Mr. F. W. Waller, of Gloucester, has presented a report which shows that the cost is expected to be nearly £1,000.

WAYSIDE NOTES.

THE Naval Exhibition is now closed, and people begin to venture suggestions for a future show. "Why not an Ecclesiastical Exhibition?" writes one. We talk of the army, navy, and the church, it is argued; then why not a Church or Ecclesiastical Exhibition? The proposal does not seem to me a very brilliant one. If the Church of England is to be mixed up with brass bands, open-air cafés, and three-and-sixpenny dinners, and all the rag-tag and bob-tail of the popular promenading exhibition, as it has developed in this country, then every sober-minded person, who has, withal, some feeling of veneration, will revolt at the idea. There is a special form of religion, with mob and music, pretty wide-spread nowadays, which might be left to take full care of matters of this kind. "Ancient churches, cathedrals, the colleges of Winchester and Eton, schools, and hospitals," and "architecture, painted glass, embroidery, &c.," would be all very well in their way; but even a churchman travelling on the broad-gauge will hesitate before putting "translations of the Bible . . . Books of Prayer, breviaries, and various forms of the Prayer Book, Ecclesiastical dress, cartoons, rites, and ceremonies and vestments" before a crowd of cheap-trippers, loungers, and average time-killing exhibition-haunters. What day the dignitaries of the Church of England might be found consenting parties to such a proposal we shall be warranted in talking in one and the same breath of religion and Punch-and-Judy shows, and mentally reverting to the times of the Pharisees. I trust that the reader will not think that I "fash" myself unnecessarily. When one of the foremost morning papers, commenting on the suggestion, says "We are far from thinking the suggestion of our correspondent unreasonable," it seems seasonable, for those who *are* thinking the suggestion unreasonable, to say a word. [Later. I find I might have saved myself the trouble of this paragraph. The "Reserve Forces" seem more likely to be on show next year. Still, I leave it in "as provision."—G.]

Your report of the steps taken at Coventry to mark the inclination of the spire of St. Michael's Church on the pavement under the tower must have been perused with considerable interest by all students of the ways of old Gothic builders. I allude not so much to the inclination of the spire as to the further facts discovered in connection with the setting-out of the original building. It seems very clear that the old builders were often exceedingly inexact in laying out the plans of churches, for it only needs a 5ft. rod and a little patience to ascertain this for oneself by measuring a number of ancient buildings. From the results it is evident, very often, that discrepancies have not—as might at first sight be imagined—arisen from settlements intervening since the building was erected, but are referable to an "original sin," the setting out having been inaccurately performed, according, at least, to our enlightened 19th-century views. It would be as interesting as it is impossible to know the exact causes of many of these irregularities in plan. Were the builders careless or indifferent, incompetent, or working "of malice aforethought"? One hardly likes to think that anyone setting out a plan would intentionally throw out the measurements; the idea seems incompatible with the simple honesty of Mediæval workmanship and design. More probably these inaccuracies have been the result of rough-and-ready methods of setting out and the absence of the perfected measuring devices of later days. Anyhow, it would be foolish for a modern builder to give an inch or two here and a half-foot there, thinking thereby to be more Gothic in spirit, although a noble carelessness of this sort might oftener—as many writers have pointed out—be observed in the detail which nowadays has more than a tendency to be mathematically executed, and, as a consequence, machine-like in effect.

It yet remains for some enterprising country gentleman to provide himself with an up-to-date moated grange. Regarding the Mediæval mud-bottomed and mud-banked moat as altogether behind the times, and seeing how really beautiful water looks when perfectly pure—which is not very often in London, by the bye—in swimming-baths constructed of glazed ware, light in tint and simple in design, the *fin-de-siècle* moat should be similarly constructed. This, as I say, remains to be done; but the owner of that beautiful old English home in the Kentish Weald—to wit, Ightham Mote—is showing the way. Some two months or so back I was looking round the old place and found divers works in progress thereat, learning, furthermore, that it was contemplated to *line the moat with cement*. It is currently reported that the new owner of the Mote disposed of the old oak furniture and re-upholstered with the assistance of Maple or one or another of the big furnishing houses. Providing that both the report and the information as to the cementing are correct, then to learn the one is to be prepared for the other.

Lauderdale House, in the newly-opened Waterlow Park, is condemned as unsafe. Consequently, one can imagine that the old house forms all the more charming a picture, and that the supposition is not unwarranted, may be seen from Mr. Railton's sketch in the last number of the *Illustrated London News*.

So the Blackwall Tunnel is to be proceeded with, and not remain merely a paper scheme, as I ventured to remark last week. I trust that it will be found more useful to Londoners generally than a study of the map of London, showing Blackwall opposite a bare stretch of Greenwich Marshes, would lead one to suppose, and that that long-suffering individual the London ratepayer, will not awaken one fine morning to find that he has expended £871,000, plus extras, in providing a means for facilitating the commercial operations of a few large manufacturers who have their works in the immediate neighbourhood of the proposed tunnel. Respecting the tenders, there is more than twenty shillings difference between £871,000 and £1,112,000 6s. 3d. (I thought it was "six and threepence three-farthings," but I see on referring again that "six-and-three" are the exact figures), so that the public will have another list of tenders enabling them to further badger the architectural profession in the matter of tenders, and propound once more the unanswerable question, "Why the difference?" They might, for a change, ask of the £1,112,000 6s. 3d. tender, "Why this thusness?" Not that I can myself do anything to solve the enigma, further than to suggest that there was a clause in the bill of quantities something like this, and under the heading "Excavating":—"Extra only: allows for navvies treading out of the way of earth-worms." Anyhow it is wonderful estimating. The gentleman who estimates so finely as to consider that to be just and fair the sum of 6s. 3d. should be retained in a gross amount of over a million sterling, ought to get shown some little respect by the estimating profession.

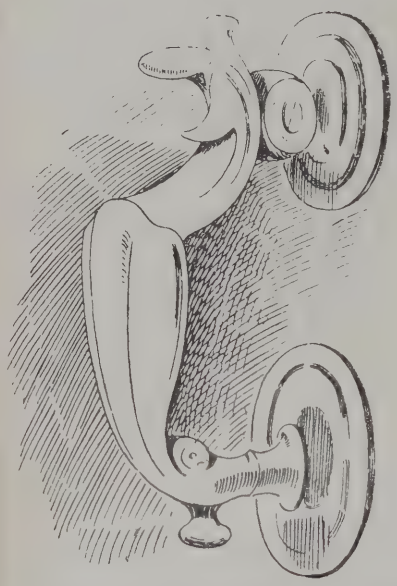
"An old complaint" crops up again. The sufferings of residents in parts of the West of London from the evil odours of brick-burning may be remembered, practically and concretely by some, theoretically and of hearsay by others. An inhabitant of Hammersmith writes to the *Standard* of the 28th complaining again of the stenches from the brick-fields of Wood-lane, Hammersmith, stating among other details, that although a mile away from the brick-fields he has been "awakened many times in the middle of the night by the horrible smell pervading the house throughout." "It seems useless," writes the correspondent, "to expect the Hammersmith vestry to take this matter up seriously, the brick-making interest being too strongly represented upon it." If this statement is wholly warranted, here is a matter that should receive the attention of the Local Government Board. It is something more than a nuisance when the inhabitants of a district like Hammersmith and Kensington have to put up with an evil because the vestry is so composed as to prevent the means of redress taking effect.

The carpenters being back to work, there is now some chance of getting roofs framed and floors fixed with something like despatch. Had the strike continued, and another severe winter set in, stopping the execution of brickwork, the result must have been deplorable to building artisans generally. What with a bad winter, and strikes and lock-outs, there has been a trying time for all workers of late, and I can only home that now matters will go on smoothly for the future, and a mild winter make up a little for the stress of last season. Works during the past wint were stopped for ten weeks, owing to fro which, I suppose, is a longer period than a within the memory of living architects. Al gether, taking stoppage by frosts and by strik and lock-outs, there must have been wonde fully little work done on many jobs since t time last year—about the beginning of th winter which, with its iron-bound country, i blocked Thames, and still, clear Arctic nigh will not quickly fade from our memories.

Goth

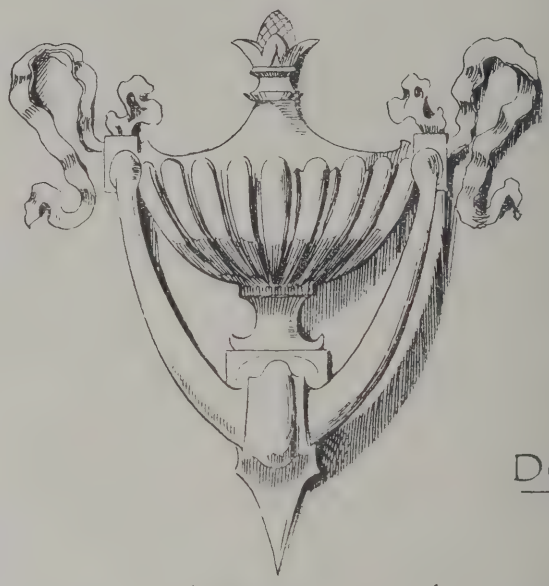
CHURCH FURNITURE.

A NEW Catalogue of Church Furniture issued by Messrs. West and Collier, Hambleden, Henley-on-Thames, Oxon, co taining designs of woodwork and furniture churches, vestries, and parish-rooms by A. Mardon Mowbray and other church arc tects. The number and variety of the furnit and articles—from altars to hassocks and kneelin pads—illustrated preclude any detailed account the publication. Church furniture, designed u ecclesiastical lines and truly architectural pr ciples, has made a considerable advance upon old-fashioned, ugly, and unchurchlike fittin which once were tolerated by the apathy a indifference of our forefathers. Indeed, 18th-century furniture of our churches reflec very accurately the apathetic churchmanship the age. Messrs. West and Collier's illustra catalogue gives us a pretty good idea of the p gress made in ecclesiastical fittings and acc sories of worship generally, executed in de pitch-pine, and oak.



The designs for altars and their accompa ments, pages 1 to 4, show structures in th materials, the prices for the former rang from £11 in deal to £15 in oak. The fronts divided by moulded stiles into three comp ments, cusped, and carved with appropri ornaments. The tops measure 7ft. long 2ft. 6in. wide, and 3ft. 3in. in height, and shown with super-altars. Altar crosses pitch-pine and oak, plain or gilt and painted, candlesticks of the same materials, turned, shown on another page. Frontal presses for s of frontals of the colours of the seasons, presses for vestments in deal, pitch-pine, oak, altar book-rests, credences, both in table and bracket form, sedilia, choir-seats, pl and carved; kneeling and prayer desks, other sacrarium and chancel fittings are il trated by perspective sketches. Many of th are from good old examples and types, as in case of the kneeling and litany desks and lecte Several examples are given of nave seats w plain cut and chamfered and carved ends. Th are priced in deal at from 6s. 6d.; in pitch-p from 7s. 6d.; and in oak, from 9s. 6d. per foot up to 13s. to 16s. per foot. Open framing is suitable for mission churches, examples of wh are given. The catalogue includes other adjun to church worship, such as processional cros banners, hymn frames, &c. Several descripti of chairs, rush and wood seated, are illustra and some flattering testimonials from the cle are appended as to their quality and comf Messrs. West and Collier show two good exam of lych-gates. We can recommend their ca logue to architects who are designing or speci ing the furniture of churches, as well as to th of the clergy who are undertaking similar wo The illustrations are well drawn, and the pr affixed in each case.

The electric lighting committee of the Glas Town Council have, on the recommendation of William Thomson, decided to have a scheme electric lighting on the "low tension system," p pared for the city by Prof. A. B. W. Kennedy London.



An arrangement has been arrived at by which Great Northern Railway will not again oppose Edward Watkin's Bill for his new trunk lin London from the North. Negotiations have b going on for some time between Sir E. Watkin Lord Colville of Culross, as chairman of the G Northern, and a definite agreement has b come to. A fiercer opposition than that of session is, however, threatened by the resident St. John's Wood, the present proposals being clared to be more objectionable than the scheme.

Sir Douglas Galton has been requested by Sindaco of Florence to investigate the sani condition of that city, and report what impro ments he would suggest.

D BITS FROM NORMANDY.—OAK LAWN, CRAWLEY DOWN.—ELLINGTON CHURCH, HUNTS.—LANCASHIRE AND YORKSHIRE BANK PREMISES AT BURNLEY.—THE RED LION HOTEL AND SHOPS, LEYTONSTONE.—PARK LODGE, ALBERT GATE.—OLD EAST ANGLIAN FIREPLACES AND DETAILS.—PRINTERS' ALMSHOUSES, WOOD GREEN.

Our Illustrations.

D BITS OF NORMANDY: RUE DES MATELAS, ROUEN; RUE DE L'HOMME DE BOIS, HONFLEUR; RUE DE PARADIS, LISIEUX; RUE PORTE AU BERGER.

HESE pictures were taken by the Rev. Precentor ann, of Bristol Cathedral, in August, 1890, with Optimus" rapid rectilinear and wide angle nses. They were printed by the platinotype ocess (hot bath), and exhibited and medalled the Crystal Palace Photographic Exhibition st spring. Rouen and Caen have suffered uch from modern alterations, and it is now fficult to find in them (and especially in the ter) two or three old houses so grouped gether as to make a picture. Their fine urches, however, are well preserved. In sieux and Honfluer, whose commerce has not ade such advances, the antique appearance of the iddle Age Domestic architecture has been less rongly disturbed. There are still some very e specimens to be found in Lisieux, notably in e Rue aux Fèves, or Bean-street, where is the use of Francois I., of which the front is richly rved. This town is one of the most picturesque Europe, and abounds with subjects for the ist. No. 1 was taken in one of the oldest arters of Rouen, not generally visited by the rist, and close to the church of St. Vivien, ose spire appears in the picture. No. 2 resents a street in Honfleur, full of the quaint l timber structures which are still plentiful in t once thriving seaport—*e.g.*, in the Rue mbetta and Rue de Puits. No. 3 shows some l buildings in Lisieux, situated close to the thedral, at the junction of the Rue du Paradis th the Rue Grande. This view was taken on dull day with a very rapid plate; exposure out half a second. No. 4 is a corner bit in the lest quarter of Caen, just behind the church St. Pierre, and near the castle. There is now ry little of the kind to be found anywhere in s town. These interesting old gabled houses the 14th, 15th, and 16th centuries, with their ries projecting on corbels, and sometimes namented with elaborate carving, are fast disppearing out of the country. It is well that thful reminiscences of them should be preved, as they now so easily may be by the proved processes of photography.

OAK LAWN, CRAWLEY DOWN.

IS house has recently been erected at Crawley wn, East Grinstead, Sussex, for Mr. T. H. ckley. The accommodation on ground floor sists of dining-room, drawing-room, library, siness-room, kitchen and offices, and small conservatory; and the upper floors contain eight drooms, two dressing-rooms, bath-room, &c. cal sandstone from the quarries of Mr. R. Whitehead, of Old Paddockhurst, has been used for the dressings of entrance front, and Rowfant bricks are used throughout. The outer walls are hollow, and tile-hung on second floor. The heating of house is supplemented by the extension to various parts of the hot-water system of conservatory. Stables were also erected near the house, and both from the designs of Mr. T. Maclaren, 10, Great Queen-street, Westminster. Mr. Samuel Webber, Crawley Down, was the builder. The drawings reproduced herewith were exhibited in this year's Royal Academy.

ELLINGTON CHURCH, HUNTINGDONSHIRE.

ELLINGTON is a village in Huntingdonshire, five miles west of the town of Huntingdon. The church is chiefly of the Perpendicular period; but there are two good doors of Early English, or perhaps Very Early Decorated, date—one being the north door of nave, and the other the priest's door on the south side of the chancel. The chancel was rebuilt by Sir G. G. Scott in 1863, and is entirely modern, with the exception of a door just mentioned and a Perpendicular window on each side. The old chancel had also a two-light square-headed window on each side, and an east window of four lights, square-headed, all of Debased 18th-century character. The present east window is based upon fragments of an old one found in pulling down the walls. The roof of the old chancel was of flat pitch; but it had every indication of having been lowered at some time. The nave is very excellent Perpendicular work, with tall piers and moulded arches, a good clerestory, and a splendid oak roof with carved figures of angels with outstretched wings at the feet of the principals. There are similar roofs over the aisles. These roofs are in very bad condition, and will soon fall in if not attended to, and this in spite of a magnificent endowment left expressly "for the necessary repairing and ornamenting of the church"! There is, therefore, urgent necessity for the vicar and churchwardens and the Charity Commissioners to take the matter in hand without delay, as it would be a pity if so fine a church were allowed to go to ruin. A few years ago the churchwardens took off the lead from the south aisle roof, and replaced it with slate. The tower and spire are of Very Late Decorated character. The tower has good double belfry windows and a band of quatrefoils below the spire, the height to top of which is about 120ft. There are four bells, with the following inscriptions:—No. 1. Sancta Margareta ora pro nobis +. (in Gothic letters, and with a shield, England and France, quarterly). No. 2. Robt. Taylor, St. Neots, fecit 1788. Thos. Ladds and Henry Hanger, Ch. wardens. No. 3. R.D., 1699. No. 4. Vox Augustini sanctin aver Dei +. (in Gothic letters, and a shield with monogram TL. W.) The north porch is very good Perpendicular, with good spandrels over doorway, and the windows of north aisle are richer than those on south. The pulpit, seats, &c., are modern, but the altar is a good oak table of Renaissance design. In 1863, when the old chancel was pulled down, the ancient altar slab, with five crosses incised on it, was found under the floor. The font is a good octagonal one, with panelled sides and moulded stem and base, of the Perpendicular period. Bacon, in his "Liber Regis," gives the dedication as All Saints; but I have heard both Holy Trinity and St. Barnabas mentioned, and the village feast is kept on the first Sunday after Trinity. There are two Perpendicular high tombs, with panelled sides, in the churchyard on the south side of the church. There is a tradition that underneath are the remains of two old ladies, who bequeathed the endowment before mentioned of sixty acres of land for the repairs, &c., of the church.

JOHN LADDS.

LANCASHIRE AND YORKSHIRE BANK PREMISES AT BURNLEY.

MESSRS. BELL AND ROPER are the architects of these branch premises of the Lancashire and Yorkshire Bank at Burnley, of which we give back and front elevations, and ground-floor and first-floor plans.

THE RED LION HOTEL AND SHOPS, LEYTONSTONE.

THESE buildings, the property of Messrs. W. Brown and Son, of Leytonstone, are within three minutes' walk of Leytonstone Station, G.E.R., at the corner of the High-road and Harvey-road, the site lately occupied by the well-known Old Red Lion. They are designed in a Late Gothic style, freely treated, the idea being to keep as far as possible from the usual façades which buildings of this class so often present. The materials at the architect's disposal were malm facings relieved with dressings of Monk's Park Bath stone, and red granite shafts with grey plinths to the ground story. The buildings comprise, on the ground floor, a spacious bar, bar-parlour, kitchen to serve bar, stores, &c. Under the bar are the cellars, so designed that they can be kept at a uniform temperature winter and summer. On the first floor are a suite of Masonic rooms, consisting of lodge-room, ante-rooms, &c., and a banquet hall 31ft. by 58ft., which is also available for entertainments, when the lodge-room can be thrown open to the hall, giving an extra 775 superficial feet of floor space, besides which an end gallery is provided. The rest of the building is occupied by private apartments and the kitchens, of which there are two, both top-lighted, one 26ft. by 20ft., and a smaller one. Adjoining the Red Lion, four shops are in the course of erection, and stables for thirty horses are being proceeded with in the rear. The contract for the whole of the buildings is let to Mr. Holland, of Brunswick-road, Poplar, and the bar fittings to Messrs. W. H. Lascelles and Co., of Bunhill-row, E.C. The pewterers' work was executed in a most satisfactory manner by Messrs. Hayward, Tyler, and Co., of Whitecross-street, E.C. The whole of the buildings have been designed by Mr. W. D. Church, architect, of 12, South-place, Finsbury, E.C., who has superintended the carrying out of the work.

PARK LODGE.

SITUATED at Park-place, Hyde Park, it fronts the drive and Rotten Row, and overlooks the Serpentine and Tropical Gardens. The elevation is built of red brick and stone, with balconies for every floor. There are six self-contained suites, each occupying a complete floor, thereby securing the strictest privacy. Each suite comprises an excellent dining-room, with bay window and French casements, opening on to glass verandah, and overlooking the park; a bedroom, also in the front, with similar advantages; a third room, which can be fitted to meet the requirements of tenants, as boudoir, study, or extra bedroom; a bath-room, well lighted and ventilated, containing a douche as well as a Roman bath and lavatory, the whole with hot and cold water; w.c. fitted with latest sanitary porcelain apparatus. In the basement are private wine and coal cellars pertaining to each suite; also the housekeeper's apartments and kitchen, fitted with every requisite to enable the chef to supply the most recherché cuisine, with a service lift to each floor. The ceilings are panelled and painted throughout. Every contrivance known to modern club life is brought into requisition, such as telephone, electric light throughout and gas as an auxiliary, speaking-tubes, electric bells, asbestos stoves, handsome passenger hydraulic elevator, and every item of comfort to render these suites luxurious. Special precautions have been observed in the construction, rendering Park Lodge absolutely perfect from a sanitary standpoint and thoroughly secure in case of fire, there being a fire-escape ladder from the flat roof easily accessible. The works have been carried out by Mr. Frank Kirk, contractor, of Abingdon-street, Westminster, and under the superintendence and in accordance with the plans and elevations prepared by the architects, Messrs. Martin and Purchase, of 11, Queen Victoria-street, E.C.

EAST ANGLIAN FIREPLACES AND DETAILS.

THE three mantels delineated herewith are of excellent design, and all come from two quaint towns in East Anglia, neither of which is far from Bury St. Edmunds. Lavenham, with its old-world air, was once a prosperous town, and a centre of the wool trade; but that was in the 15th and 16th centuries. Though, however, it has lost its commercial importance, it has undoubtedly lost none of its picturesqueness, and still possesses much that sprung from its period of affluence, in the imposing stone and flint Church, the Market Cross, and the beautiful old half-timbered Guildhall and kindred buildings. Amongst the latter we may mention the Old Grammar School, which contains the Mantel shown on our illustrated page, and of which we give some details to larger scale. That, and the two fireplaces from Mildenhall, a town situated

in a district rich in historic memories, are much of the same date. There is some good carving on the frieze of the left-hand Mantel, while the centre one, drawn in perspective, owes much of its charm to the curiously-shaped pilasters. The two Knockers are both good pieces of detail, the one from Hingham possessing great beauty of outline. We commend both designs to the manufacturers of modern door furniture. We also give a sketch of a quaint old Thumb Latch.

COMPETITIONS.

Manchester Royal Infirmary.—Although plans have been invited in competition for the reconstruction and enlargement of the Royal Infirmary on the site now occupied by that institution, it is by no means certain that the work will be carried out. There is a strong feeling in Manchester and Salford that it would be unwise to occupy with buildings the whole of the ground now vacant, and that a far preferable plan would be to remove the hospital to a less confined space outside the city. At a meeting held on Monday of the board of management, a memorial was received from an influential body of the trustees, urging that whilst it is important that the infirmary should be retained on its present site in the utmost state of efficiency, any extension of the accommodation thereon is very undesirable. It was unanimously agreed to reply that extra accommodation was pressingly required, and adding:—"On the 1st January next the Board expect to receive from the selected architects plans for the additional accommodation proposed. Should the Board approve of any of the designs, they venture to hope the memorialists will give to such plans their impartial consideration when submitted to the judgment of the trustees, in fulfilment of the pledge given by the chairman at the annual meeting in July last."

CHIPS.

The Wesleyan chapel at Penketh, near Warrington, was reopened last week after enlargement, including a new front brought forward to the high road, and new seats, platform, and vestries. Mr. William Owen, of Warrington, was the architect, and Mr. R. W. Collin, of the same town, carried out the works at a cost of £1,100.

The St. Agnes' Industrial Home, which is in course of erection at Knowle, near Bristol, from plans by the late Mr. John D. Sedding, was visited by the Duke of Edinburgh on Saturday. It is intended to provide additional accommodation for the work carried on by the Sisters of St. Raphael's, Bristol. In the new home accommodation will be provided for 60 children, and the structure will afford a home for the Sisters and a laundry for poor women. The buildings will stand in grounds four acres in extent, and will be in the Queen Anne style. The cost will be about £12,000.

Classes under the auspices of the District Council for Edinburgh and the East of Scotland for the Education of Plumbers were inaugurated at Galashiels on Saturday, when an address on "Modern Sanitation" was delivered in the Burgh Hall by Mr. James Thomson, C.E., Edinburgh.

On Saturday a memorial stone was laid in the domestic chapel connected with the house now being erected at Westfield, St. John's, Wakefield, as a residence for the Bishop of the Diocese. The cost of the bishop's house will be nearly £10,000. The plans were prepared by Mr. William White, F.S.A., Wimpole-street, London, W., and the contract for the whole of the work was let to Messrs. Gould and Stevenson, of Hunslet, Leeds, who are carrying it out under the superintendence of Mr. Sentance, of London, the clerk of works. The domestic chapel, which is under the examination hall, and adjoining the bishop's library, wil accommodate about 40 worshippers.

The new Roman Catholic Church of St. Mary, at Paisley, was consecrated on Sunday week. The building is in the Gothic style, from plans by Messrs. Pugin and Pugin. It is 120ft. long, 50ft. broad, and 60ft. high, and accommodates about 900 persons. The cost has been about £5,000.

A new town hall, with other buildings attached, is to be erected, at the cost of £60,000, by the vestry of St. Saviour's, Southwark.

Miss Eugenie Sellars will deliver a lecture, by permission of the Committee of Council on Education, in the theatre of the South Kensington Museum on Nov. 11, on "The Greek Theatre," this being accompanied by limelight illustrations.

The partnership heretofore subsisting between Messrs. Mills and Jones, of Regent-street, W., architects and surveyors, has been dissolved.

Building Intelligence.

Alnwickhill, N.B.—A new Industrial Home for Fallen Women was formally opened last week. The new building is designed by Mr. R. Wilson, Queen-street, Edinburgh. The main building is two stories in height, and has a frontage of 104ft.; but running backward at each end, and also in the centre, are one-story buildings forming an ⊓ on plan. The ground floor contains the administrative departments of the home, whilst the floor above consists chiefly of the dormitories. Extending backwards from the right-hand side of the building are the washing-house, laundry, drying rooms; to the left are the dining-hall, sewing-room, &c.; whilst in the centre behind are the kitchen and other offices. The exterior is in a very plain and simple style. The cost is £5,000.

Bootle.—The ceremony of opening the new police building in Oriel-road, Bootle, took place on Friday. Mr. C. J. Anderson was the architect. The contractors were Messrs. Woods and Son, and Mr. Worrall was the clerk of the works. The plan of the building is divided into two parts, the administrative department, which includes the two courts, magistrates' room, offices, and cells, and a living department, containing the housekeeper's rooms, police dormitories, day-room, and laundry. The large court occupies an almost central position in the building on the first floor, and is approached by a large stone staircase from the public entrance. The fittings of this court are executed in oak, dull polished, panelled, and moulded. The chief constable's office is placed on the ground floor. Adjoining the police entrance are the charge office detention-room, and from thence corridors lead to the cells and airing yard. The back of the building contains the housekeeper's rooms and kitchen, which are approached by a separate entrance and staircase from the drill-yard, as are also the three police dormitories, day-room, and laundry. The front elevation, facing Oriel-road, is of Classic design, and is faced with Minera stone. The north elevation is faced with buff-facing bricks, and all the other elevations are faced with selected common brick and strings and arches of Ruabon brick.

Bristol.—The Duke of Edinburgh on Saturday opened the new wing of the Bristol General Hospital, which has been erected at a cost of £25,000. The new wing has been erected on the north and north-east sides of the hospital, and the three new wards front Bathurst Basin. On the first floor there are two new wards for male patients, one containing thirteen beds and the other eight. On the second floor is a women's ward containing thirteen beds, and four smaller rooms for female patients. Another important addition to the buildings attached to the hospital is the Nurses' Home (for forty nurses), which fronts Guinea street. It consists of first, second, and third floors, and provides a room for each nurse. It also contains a common room and store-room for boxes. The additions have been built of stone to correspond with the older portion of the building. Messrs. Crisp and Oatley, of Bristol, are the architects, and the builders are Messrs. Brock and Son, of St. Philip's Marsh, Mr. Alfred Pritchard having acted as clerk of the works.

Denton.—St. Mary's Church, which was consecrated on the 22nd inst., has been erected from the design of Mr. J. P. Pritchett, of Darlington, in the Early English style. It comprises nave, 38ft. by 18ft.; chancel, 22ft. 6in. by 12ft.; vestry at west end, 15ft. by 6ft.; organ chamber, 9ft. by 8ft.; and south porch, 8ft. by 6ft. Externally the walls are built of Houghton Bank stone, with dressings of the same. Internally the walls are lined with buff bricks from Normanby brickyard, with stone dressings to jambs and arches. The roofs are of pitch pine, unvarnished, and covered with brown tiles from Ruabon, laid on felt. The floors are of wood blocks in the seats, and mosaic tiles in the passages and chancel. The fixed seats accommodate 100 adults. The total cost has been £1,500.

Drumcondra. — Last Monday Archbishop Walsh laid the foundation-stone of a new wing in connection with St. Patrick's College, Drumcondra. The existing college buildings were erected in 1884, and were designed by the architect to the college, Mr. John L. Robinson, A.R.H.A. They comprised large study classrooms, recreation rooms, library, kit refectories, and a large dormitory to accor date 75 students It was soon found nece to increase the accommodation, and plans prepared in 1887 for a new wing, the erecti which was suspended until the present time is to be erected in continuation of the exi building, and at right angles to it. The b ing is Classic in treatment, with a rusti basement and chiselled plinth. The upper are built of Kingscourt pressed red bricks, granite stringcourse, and massive coved course. Over the back stairs will be a camp 112ft. high, to carry the college bell and c The works are being carried out by Alde Toole.

Edinburgh.—The managers of the Infirmary have under consideration a pro extension of the building towards Lauriston Messrs. Sydney Mitchell and Wilson, archit of Edinburgh, have submitted a plan of the posed extensions to the managers, the features of which are the removal of the lau to the most northerly part of the new site erection of a surgical pavilion to the west c present surgical pavilions, and the erection large pavilion or pavilions on the rest of the site. The object aimed at is the provisi about 200 new beds. The treasurer estir the probable cost of the extensions—tha to say, site, new buildings, and furnishing £73,500.

Newcastle-on-Tyne.—The new R.C. ch of St. Michael and Holy Angels in Westmor road was solemnly opened on Wednesday. church has been erected from designs by, under the superintendence of, Messrs. D Hansom, and Dunn, of Newcastle, and is Decorated in style. Every window in the ch is varied in the design of its tracery, and octagonal lantern, with its eight window surmounted with battlements and carved en ments. The height of this lantern is 80ft. it is placed at the intersection of the nave transept roofs. In a niche rising from th of the east window in the apex of the ga placed a figure of St. Michael. Both north south transepts, which terminate the aisles utilised as chapels, the organ being placed o screen in the south transept. The roofs o church throughout are of pitch pine, mo and panelled, at the height of 50ft., with nices enriched with tracery and carving. lantern is open to the church, 73ft. abov level of the nave floor, the windows being with rich grisaille glass, and the ceiling rated with gold and colour. The contrac Mr. L. Gaby, of Gosforth; the internal stone was supplied by Mr. Jos. Bladwe Bath; the mosaic altar frontal has been exe by Messrs. Powell, of London, from car prepared by Mr. Jos. Pippet. Mr. Ri Robinson has acted as clerk of the works. total interior length of the church is 134ft. the width 48ft., the seating accommodation for about 700. The parquet oak block flo is by the Acme Woodpaving Company, Lo The church will cost £20,000.

Revesby. — Revesby Church, Lincoln was reopened on Tuesday, the 20th inst. new church consists of a western tower and a nave and north aisle of the same leng chancel with organ-chamber and vestry north side, and a south porch, all designed style prevalent in the latter half of the century. The spire, at present not built, rise from within a richly traceried parapet angle pinnacles, and will form a conspi object over the trees for a considerable dist The walls externally are entirely of An stone, and the internal dressings of the stone; but the internal walling is of red lington stone. The contractors are Messrs. Knight, and Co., of Sleaford. Mr. Wych has been the manager for the contractors the whole work has been carried out und supervision of Mr. T. Carse, clerk of works, the designs of Mr. C. Hodgson Fowler, F.S.A., of Durham.

On Saturday afternoon Mr. John Morle veiled a bronze statue of the late John B erected by public subscription, in the Town Square, Rochdale. The statue is the work o Hamo Thornycroft, R.A. It is 9ft. high stands on a granite pedestal 11ft. high. The the statue itself is about £2,000.

Engineering Notes.

LASGOW BRIDGE.—The town council of Glas- at their meeting on Monday received a es of important recommendations as to the nstruction of Glasgow Bridge, which they e recently been informed is urgently neces- . A sub-committee recommended that the bridge be constructed of steel, with cylin- al foundations and facings of granite; that ave two piers resting in the river; that it be wide, and that Mr. George Miller Cunning- ie, C.E., Edinburgh, be requested to provide liamentary plans and specifications for a porary service bridge, and also for a per- ient bridge. After a discussion, the motion eeing to the appointment of Mr. Cunning- ie as engineer was carried by 24 votes to 13 es.

CHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

A. LYRIC CLUB.—The fourth season of this was inaugurated by a smoking concert held the head-quarters, Mona Hotel, Covent den, on the 23rd inst The programme anged by the president, Mr. A. C. Bulmer th, was most successfully carried out, Messrs. th, Hunter, Smith, Perks, and Captain tson contributing songs, and Messrs. F. T. W. ler and Perks recitations. Mr. C. D. Imhof in proved a most efficient accompanist. The t concert takes place on November 20, and l be arranged by Mr. Earle, who promises a formance by the A.A. string band and other cial items.

LASGOW INSTITUTE OF ARCHITECTS. — The nty-third annual meeting of the Glasgow titute of Architects was held on the 21st inst., . William Leiper, president, in the chair. e report of the council, submitted by Mr. J. Maclean, secretary, stated that two new mbers had been admitted during the year. e number of ordinary members on the roll v stood at forty-nine, and there were eight norary members, making fifty-seven in all. In ving the adoption of the report, the chairman pressed regret that the proposal that the titute should have a home of its own had not nd favour with the majority of the members, ; he did not despair of the suggestion being adopted. The most important architectural ject in Glasgow at present was the new Fine t Gallery, Museum, and Music Hall, and he nsidered that a School of Design under the ne roof would be an immense advantage. ferring to the growing use of red stone and racotta in street buildings, he said this was her remarkable in a city where formerly only at was originally white stone was tolerated. doubt the fact that red stone resisted more ectually the deleterious results of the town nosphere laden with acids and smoke was the son for its more general adoption. He ought, however, that some better method of eserving white stone should be resorted to than inting, and remarked that in Paris jets of am were used once a year to clean out the t and dirt which had gathered on the fronts of e buildings. The report was adopted.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.— ne inaugural meeting of the present session of e Institute will be held on Monday evening xt, the 2nd November, 1891, when the opening dress will be delivered by Mr. J. Macvicar nderson, president. The programme for the ssion is:—November 16, "Modern Egyptian uildings," by Mr. H. Favarger, of Cairo; ovember 30, "Sculpture and Sculptors' ethods"; December 14, "American Theatres," Mr. Horace Townsend, of New York; nuary 18, award of prizes and student- ips; January 25, presidential address to idents, presentation of prizes; February 8, Revision of the Building Acts of the etropolis"; February 22, "Stained Glass"; arch 7, election of a Royal gold medallist; arch 21, "Byzantine Art," by Professor itchison, A.R.A., vice-president; April 4, Wrought-Iron Work: the Renaissance eriod," by Mr. J. Starkie Gardner; ay 2, report of council; May 16, "The 1891 ongress of Hygiene and Demography"; ay 30, "Castings in Metal"; June 13, election council; June 27, presidential address on esenting the Royal gold medal.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and SIXPENCE for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., L., LI., LIII., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

THE VICTORIAN ARCHITECTS' REGISTRATION BILL.

To the Editor of the BUILDING NEWS.

SIR,—The draft which you published last week, of the Victorian Architects' Registration Bill, and which seems to have every prospect of shortly becoming law, must have attracted the attention of a very large circle of readers, who will doubtless have noticed how closely the English Architects' Registration Bill has been followed. A General Council is to be formed, as is proposed in the English Bill, and is to be constituted upon similar lines, though much smaller—almost too small for efficient working, one would be inclined to think—and its duties are to be the same. No such officer as a registrar is mentioned, but one would obviously be needed. The qualifications of those who are to be entitled to Registration, both on the passing of the Bill and subsequently, are clearly taken from the English Bill, with certain modifications to suit Colonial practice, the right to Registration of all *bonâ-fide* architects practising at the time of the passing of the Bill being carefully recognised, as it is in the English measure.

Similarly, all the other clauses are founded upon the excellent draft Bill of our English Registration Act Committee, save one, which here it would be scarcely wise to introduce—that which fixes the rate of payment which architects in the Colony may demand.

Now, Sir, this shows two things. Firstly, it is found to be as necessary in our newest colonies as in the mother country, that such a Bill should soon be made law; and, secondly, it is accepted that the best model for such a Bill, even in so distant a part of the world as Victoria, is that of the English Committee. This must be most encouraging to the English workers, for a Bill which suits the needs of those who are far away, with but slight and unimportant modification, cannot be far from the right measure for those for whom it was intended.—I am, &c.,

REGISTRATIONIST.

Intercommunication.

QUESTIONS.

[10653.]—**Wainscotting.**—Some little time ago a surveyor issued quantities for certain works, in which he specified some wainscotting, but never mentioned "oak." The builder being a North-country man, said that in Yorkshire and various other parts wainscotting was done in pitch-pine and other woods (the term "wainscotting" being a general term for dado round a room or entrance hall). The question is this: Is the builder compelled to put the same in wainscot oak?—WAINSCOT.

[10654.]—**Frontage.**—Can any of your readers help me in the following matter? I own property in the main street, the building is set back from the street, say, ten yards. Many years ago the frontage was occupied as a garden. At that time the owner of an adjoining property purchased the right to restrain the erection of any building higher than, say, 5ft. For a consideration he has allowed the adjoining owner to build upon his front land, and he agreed to give me the same privilege, which agreement he (a lawyer) now refuses to carry out. What I desire to know is, are there any precedents to show that when the character of the neighbourhood has entirely changed, as in this case, I should be justified in fighting an action to sustain my right to erect a building similar to my neigbour?—AN EX-BUILDER.

[10655.]—**Mills.**—Where could I get any information on mills and their construction?—J. W. C.

[10656.]—**Model Farming.**—Can any reader inform me of a recently erected set of well arranged private farm buildings on a fairly extensive scale that might be seen at no very great distance from London?—A BUCOLIC READER.

REPLIES.

[10634.]—**Brick as a Building Material.**—I think I read "Brickwork" aright; but he overlooks the fact that bricks never have a drip-in on the top bed as stones so frequently have, particularly at the ends, where they so often slope or slant inwards and downwards towards the upright joints. If stones were always dressed or selected for, at least, the width of a brick, quite level or "full to the square" from the face—that is, with a slight drip-out on the top bed, the whole length, there would be fewer damp stone walls Brick joints seldom take wet unless the mortar is bad or partly omitted, or that the bricks are dusty on the surface when laid. Bad bricks no doubt absorb and pass moisture through, especially if in exposed places facing south and west. "Another Ignoramus" in a letter to the "B. N.," 16th inst., advocates hollow brick walls, and adds that with "stone throughs" (thorough bonds), when "left level or dripping down," the wet will follow them as he has noticed it. He is quite right as to that, but the joints need not be 1in higher inside than outside, a slight drip-out towards the outer face will do if continued all along. Other stones as well as "throughs" having a drip or fall-in, admit wet as freely if not quite as directly. Perhaps the worst are edgers or "looking-glasses."—M. M.

[10640.]—**Sea-Sand in Mortar.**—I fear I do not read "Brickwork" aright as to "hygrometric" and "atmospheric" moisture being "attracted" by sea-sand. If any moisture comes in contact with the saline matter on the surface or impregnating sea sand, it will absorb it, and, if "atmospheric," condense it, so as to cause damp. In Belfast—some years ago, at least—the best building sand was got on Hollywood Beach between high and low water, so that the pits were covered and filled in by each tide. The precaution taken when using this sand for walling or plastering was to spread a thin layer of the sand on the ground in proportion to the quantity of lime and sand to be then prepared, and to spread on the layer of sand also a thin layer of lime (unslaked) in proportion to the quantity to be prepared, and to throw just as much water on the lime as required to slake it, and so on, adding other layers of sand and lime until all is used, finishing by a layer of sand at top and sides, so as to inclose the lime, the heat from which in slaking dries and kills the saline matter of the sand. Walling with bricks or sandstone seldom, if ever, shows damp after this, and plastering only shows a hoar frost (Epsom salts) on the surface after some months, and when removed does not show again, or any other bad effect.—M. M.

[10642.]—**Strong Room.**—I am much obliged to Mr. Robert Phillips for information concerning above, but should like to be enlightened on one or two points: (1) If air-bricks close to floor inside and discharging outside under the arch skewback, are always successful, why is it necessary to provide an extraction flue!—which, I presume, would be in the centre of ceiling or roof. (2) What danger is there from explosions by having gas jets inside, if plenty of ventilation is provided as above? And could not the stopcock on gas supply be outside, with some arrangement for shutting off by closing the door? By using a lamp with flexible tape it wou'd be necessary to remove same every time anyone went to the strong room, and this would be very troublesome, as I want the iron door to be open all day, and to only use the ventilating gate during such time.—F.

[10644.]—**Joists.**—I am much obliged to Mr. W. Stevenson for his interesting reply to my query. I shall be very glad if he will give a few notes on what he says has far more to do with the strength of a joist than has the pattern of grain on the end section—viz., quality, knots, and twisted grain—so that I may know a good joist when I see one.—SAP.

Legal.

ARCHITECTS AS AGENTS.

Of course, speaking generally, the authority of an architect who is employed by a building owner in the carrying out of certain work, is coextensive with the scope and purpose of that employment according to the usual rules of the law of agency. But this implied authority is almost always limited by the written contract under which the work is to be completed, so that in any given case the contents of this contract have to be considered. Nor can vague rules of usage and custom amongst architects be allowed to have any weight when the limits of authority as agreed are set down in writing. In other words, the contract must be taken as a whole, and the architect's powers must be found within the four corners of that document, except so far as they follow by necessary implication from the works upon which he is employed. An architect is obviously the general agent of the building owner in all matters essential to the designing, obtaining tenders for, and superintending the building or works upon which he is employed. All this naturally flows from the very object and nature of an architect's business and profession, and follows at once on his employment.

Still, these general powers are liable to be governed by the written contract and often by the facts of the case. The architect is the agent of the owner in making drawings; but as he is bound to do them properly and accurately, he cannot get over omissions in them by ordering these things to be done as extras, under his general power to order extras, for this would only apply when such were really necessary. So, again, if his drawings turn out to be impracticable, and expense has to be incurred in making them practicable, he cannot throw this upon the owner under cover of an extra, even when the contract allows him to order extras. When an architect is merely asked by the building owner to get out plans for a proposed building, he is really only engaged so far as a draughtsman, and he has as yet no authority as agent arising from his position as architect. Until further instructed, he is not empowered to get in estimates or tenders on behalf of the owner, nor, of course, can he in any way negotiate for advances upon the suggested building. Certainly the scope of his agency may afterwards be so widened as to include these and other matters; but until this happens, an architect who went on so fast would do it at his own risk, and would need the subsequent ratification of his client.

Fred Wetherfield, Solicitor.
1, Gresham Buildings, Guidhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

Bedford.—Repairs.—If the landlord through his authorised agent instructed you to do the building work, he is of course liable to pay for it. But that is more a question of fact than of law, and will have to be decided upon the evidence if the case goes for trial. If the clause you copy from your lease is the landlord's covenant to repair, then he is legally liable; but if it is a lessee's covenant, that would not be so, and the answer would depend upon the facts as above stated.

S.—Stamp.—Yes. A sixpenny adhesive postage stamp, or several postage stamps amounting together to sixpence, can be used upon an agreement, and will do as well as the 6d. impressed stamp. But the adhesive stamp or stamps must be affixed at the time of signing, and it or they must be properly cancelled by the party first signing, writing his name or initials over the stamp or stamps, with the date of so doing. Adhesive stamps cannot be put on after signing, but the 6d. impressed stamp can be done any time within 14 days from date of agreement.

Anxious.—Lodger.—You can only distrain properly upon the things left in your possession for all rent in arrear and so sell them. But there is legally no power of sale in such cases without a distress; though, of course, you can sell them if you like, and take the risk, if any, of his some day turning up and claiming the goods.

The carpenters' shop recently opened at King Henry VIII. School, Coventry, is becoming, the local newspapers state, very popular amongst the boys. The building in which the instruction is given is a wooden structure at the rear of the school, 30ft. by 18ft., and accommodating twenty students. The instruction is given by Mr. Wright, foreman at Messrs. R. Smyth and Co.'s cabinet makers. The students have already made a number of articles. Their first business was to construct for themselves carpenter's benches. They prove themselves handy in the use of tools.

LEGAL INTELLIGENCE.

The Serious Charge against an Architect.—Arthur Muckleston Leach, 38, architect, and Henry Cone, 27, of Bermondsey, were again charged at Staines, on Monday, with conspiring with a man named Adams to defraud the Liverpool and London and Globe Insurance Company of £550. Further evidence having been given, the prisoners were again remanded.

Alleged Frauds by a Bankrupt Builder.—A Special Court was held by the Newmarket (Cambs.) Bench on Thursday, to further hear the charges against Francis Johnson, builder, Fordham, for that he, being a bankrupt, did not fully discover to the trustee administering his estate all his personal estate, to wit, a debt of £28 10s. due to him, and also three ponies, with intent to defraud his creditors, and unlawfully did not deliver up to the same certain stock-in-trade in his custody at Fordham and elsewhere, and with concealing the same, and also did omit in his statement relating to his affairs the debt and stock-in-trade, and did mutilate and falsify a ledger relating to his property, or was privy to its being done, and did make a false entry in his ledger and cash account. James Johnson, builder, Soham, was summoned for aiding and abetting his brother in the above offences. A further summons was taken out against defendant, to wit, omitting in his accounts a sum of £112 due to him, and also a sum of £20 1s. 11d. Fresh evidence was given for the prosecution, and the case was adjourned till Monday next, the 2nd Nov.

An Appeal Against an Award.—Smith v. Robson.—(County Court, Westminster, Monday, Oct. 26th.)—This was a case of a somewhat unusual character, being an appeal against an award made by Messrs. Walker, Allport, and Tidman—three surveyors under the Metropolitan Building Act—as arbitrators in a matter between the parties to the appeal. Plaintiff and defendant are owners of adjoining property in Marshall-street, Regent-street, and the case arose out of a dispute concerning the condition of the party-wall, which, on the plaintiff pulling down his houses in order to rebuild, he claimed to be in such an insecure state as to need rebuilding, in which event the cost would be borne by the respective owners. Defendant claimed that the wall did not need rebuilding, but only repairing, and also claimed that the cost of such repairs should be borne by plaintiff, as the Act directs; hence the dispute. Defendant appointed Mr. Allport as his surveyor, and served a notice upon the plaintiff to make a similar appointment, which, plaintiff failing to do, Mr. Tidman was appointed by the defendant under sub-section 9 of the Act, Mr. Robt. Walker, district surveyor for the Strand District, being eventually appointed as a third surveyor. These arbitrators decided that it was not necessary to pull down the wall, but that certain necessary repairs should be carried out with all despatch, and their award was made on the 27th of July. Against this, the surveyor's fees and the amount of solicitor's charges, the appeal was made. In his opening statement the counsel for the plaintiff suggested that an amount of hostility towards his client had been shown by the arbitrators, which suggestion was warmly commented upon by defendant's counsel, who proceeded to state that, as a matter of fact, the decision of the arbitrators was that plaintiff should do exactly what in his party-wall notice to defendant he had professed to be anxious to do. "In effect," said the counsel, "the award says: 'You need not pull down the wall, but you must do the work which you said in your notice you wanted to do.'" But this was really an attempt to set aside an award because of the alleged excessive fees of the arbitrators, a proceeding which he ventured to think would not be permitted. He asked his Honour to find that in this case there was nothing bad in law, and nothing to show that these gentlemen had acted otherwise than men of honour would act. Plaintiff's counsel submitted that the surveyors had acted on a mistaken view of their duties by ordering that the plaintiff should do this work at his own expense. The wall was defendant's, not plaintiff's. He submitted, therefore, that the expense should be apportioned between the two, or else that the award should be set aside. It was no award at all, but altogether a one-sided affair, and Mr. Allport, who seemed to be the leading spirit, had acted in a manner hostile to his client. He hoped his Honour would decide that the charges should be borne equally by both parties. The Judge decided that the award must stand, but directed the solicitor's charges of three guineas be struck out. There was absolutely no evidence, he said, on which to base a charge of hostility against the arbitrators, and it was a very serious thing to make such a statement against gentlemen of the professional standing and character of the arbitrators. Defendant's counsel having applied for costs, the Judge decided to allow taxed costs.

Apportionment of Paving Expenses.—The Queen v. Marsham.—(Court of Appeal, Oct. 28, before the Lord Chancellor, the Master of the Rolls, Lord Justice Fry, and Lord Justice Lopes.) This was an appeal from the decision of Mr. Ju Denman and Mr. Justice Wills. Adelaide- Brockley, being in need of paving and repai the works were done by the Lewisham Di Board of Works, and the expenses were apporti by the board among the adjoining owners u Section 77 of the Metropolis Management Act, The actual cost of the works was £737 9s. 3d. the amount apportioned to the New Land Dev ment Association was £54 8s. 6d. £29 18s. 6 this sum having been paid by a former ow there remained £24 10s. due, and the Boa Works proceeded to recover this sum from the ciation summarily as the owners of certain h in the road. The police magistrate dec to go into the question of or receive dence as to the actual expenses incurre the board in paving and repairing the road o ground that he had no jurisdiction to go behin apportionment made by the board. The ass tion thereupon applied for a mandamus to co the magistrate to entertain the question a receive the evidence. The Divisional Court re the application, but a rule nisi was granted by Justice Bowen and Lord Justice Kay in the of Appeal, and this now came on for hearing. Crump, Q.C., and Mr. Bramwell Davis sh cause against the rule. Mr. Horace Kent, in port of the rule, contended that the actual ex of the work was a subject to be determined b magistrate. He referred to sections 225 and 2 18 and 19 Vict. c. 120, "Nesbitt *v.* Green Board of Works," "Mile End Vestry *v.* W chapel Union," and "Poplar Board of Wor Love." The Court unanimously made the rul a mandamus absolute.

Is a Builder's Office a Structure?—Parte the London County Council.—In Queen's Bench Division, on Wednesday, b Mr. Justice Matthew and Mr. Justice A. L. Sm an application was made on the part of the Lo County Council to raise a question as to what be considered a "structure or erection" w cannot be set up without their authority unde Act 45 Vict. c. 14, s. 13. There is an excep from the enactment as to builders' tempo offices, set up only to be used during the erecti any house or building. In the present case, H ever, a builder had set up at his own residen wooden structure on iron wheels, to be by him as a "builder's office," and for the purpose of any house or b ing about to be or being erected. A s mons was taken out against him before Bros, the police magistrate at Clerkenwell; bu refused to convict, conceiving the case not within the enactment, as the structure w "builder's office," and he refused to state a to raise the question. Mr. Avory, upon the pa the London County Council, moved for a rule mandamus to the magistrate to state a case to the question, submitting that the magistrate mistaken in his view, as the exception only ap to such structures as were used as builder's o temporarily and during the erection of a hou building. The Court granted a rule *nisi*.

Employers' Liability.—Messrs. J. and Eborall, builders, of Queen's-road, Chelsea, the defendants in an action recently heard at Brompton County Court, when £100 damages claimed by James Lawlor, a workman in employ. On the 26th of March last the pla was working for the defendants at 87, Elizab street, Pimlico. In carrying materials he ha cross the floor of the kitchen. There was the hole which plaintiff and another man had cov with planks. In crossing the hole one of the pl broke, and Lawlor falling into the trench, rece serious injuries to his knee. In cross-examina the plaintiff admitted that it was impossible i kitchen to discover that the plank was eaten with dry-rot, though, after pressure from own counsel, he said that, before the plank brought to the kitchen, its state might have discovered. The jury gave a verdict for defendants.

Liability of Corporations for Floo Matthews v. Mayor, Aldermen, and Burg of Barrow-in-Furness.—Judgment was giv this case on Wednesday, by Mr. Justice A Smith, tried at Liverpool Assizes, without a j which raised an important question as to lia for the flooding of premises during heavy r owing to neglect on the part of the local autho or their servants. The plaintiff sought to re compensation by reason of the defendants' ne in the management of their sewers, whereb houses were flooded. They denied their all negligence, and also set up that, even if there been such negligence, the plaintiff's houses w have been equally damaged whether there had negligence or not. Several similar actions depe on the same facts, and were governed by the r of the present one. The plaintiff was the own 16 houses at Barrow, which were built in 1884 had never been flooded prior to the flood in que on December 31, 1890, when 15 of these h

e flooded by water and sewage to the depth of in the basements. In 1875 the municipal norities began to lay down a "dual" system of nage in the borough. This system, however, not been completed, so that the storm and te water had access to the sewage pipes. carry out the sewage system the de- lants had erected a pumping-station below n-water mark, to lift the sewage on to a higher l. The plaintiff's principal complaint was that pumps were not kept going, whereby the water sewage which collected in the sewage pipes ked up through the gratings and manholes, and s flooded his houses. The learned Judge now vered a written judgment in favour of the ntiff on the principal ground of action, the unt of damages to be hereafter assessed. It agreed that the same judgment should follow the other cases, and counsel stated that the unt of the damages (as it would not be above 0 in any case) would probably be settled.

ROPERTY OWNERS AND PROJECTING SIGN RDS.—At the Leeds town hall on the 13th inst., vard Wray, builder, Spencer-place, Leeds, ap- red in answer to a summons charging him with reach of the by-laws by allowing a nuisance to t over property owned by him near Leeds lge in the shape of a sign projecting from a o some 9ft. over the pathway. The case was ore the Stipendiary last week, and on that ision was remanded with the object of seeing ther the defendant, who is the owner of the perty, and who contended that he was not onsible for the alleged nuisance, as it had been up by his tenant, would have the sign removed. the case being called on, the town clerk inti- ed that the sign complained of was still over shop, and that nothing had been done. The endiary therefore ordered defendant to pay 2s. day extending over fourteen days, 28s. in all, the costs.

N RE H. VICKERS.—A deed of arrangement has n executed by Henry Vickers, Waterway- et and Wilford-road, Nottingham, contractor, the payment to his creditors of a composition of 3d. in the £, payable in three instalments. The ecured liabilities are £12,080 9s. 10d. The mated net assets are £5,300, and the creditors y secured are £21,836 5s.

N RE J. DAVISON.—At the Birkenhead Bank- tcy Court on Friday, John Davison, contractor, on, formerly a member of the Birkenhead wn Council, again appeared in custody of a der from Kirkdale Gaol, for his public examina- . The statement of affairs put in by the debtor wed liabilities amounting to £18,933 6s. 2d., of ch £4,090 would rank for dividend. The gross ts were stated at £4,712 14s. 6d., of which 50 consisted of equities which the trustee con- red of little value. The debtor stated that n he signed the statement of affairs he con- red it was correct, but now he found it was t incomplete. Ultimately, on the application Mr. Madge, the examination was again urned for six weeks, debtor being ordered in meantime to make up his books to the date of receiving order, and also to furnish a trading unt for the last two years. An application for ase from gaol was granted.

emorial stones of a new Welsh Wesleyan pel for Pontardulais were laid on Thursday rnoon in last week. The building is being con- cted by Mr. D. Williams, of Knighton, from the gns of Mr. E. Bath, Swansea, and will cost 00. There will be accommodation for 400 ons.

he directors of the Tower Company (Limited), se capital of £70,000 has been privately sub- bed, have entered into an agreement to lease ut 124 acres of the Wembley Park Estate, ther with the now almost completed founda- s of the proposed tower. The agreement for lease is for a term of 999 years, at a rental of 00 a-year, from October, 1892, in addition to -fourth of the annual profits after the lessees e received a dividend of 15 per cent. per annum. a lease has been taken by a newly-formed com- y, and whose proposed capital of £200,000 will wholly devoted to the erection of the structure ne tower above the level of the foundations.

n inquest was held on the 22nd inst. at Leicester he body of Shadrick Norton, master-builder, of town, aged 52 years, who committed suicide anging himself in his water-closet the same ning. Evidence having been given that deceased been moody since he fell from a ladder five ks since and hurt his head, a verdict of suicide le of unsound mind was returned by the jury.

he new Mann Memorial Institute at Moreton-in Marsh was opened on Wednesday week. It is of local stone, and contains an assembly hall, by 17ft., and club premises. Mr. J. F. ver, of Kendal, was the architect, and Messrs. ves and Son, of Milton-under-Wychwood, were builders. The outlay was £1,600.

WATER SUPPLY AND SANITARY MATTERS.

ALNWICK.—The Alnwick Local Board of Health have instructed Mr. D. Balfour, M.Inst.C.E., 3, St. Nicholas-buildings, Newcastle-on-Tyne, to report on a scheme of sewage disposal for the town of Alnwick.

THE CITY AND THE WATER SUPPLY.—A committee have presented to the Court of Common Council a report in relation to water supply. They recommend that a Bill be introduced next session for the following purposes—viz., To give statutory powers to the joint committee of the Corporation and the London County Council; to authorise that joint committee to give notices to treat to the Metropolitan Water Companies within four years, and to make the giving of such notices obligatory at the expiry of that period; to constitute a tribunal to ascertain the price to be paid, and to clothe such tribunal with the fullest powers of inquiring into and deciding upon all such questions as it may consider necessary with a view to purchase; to enable such tribunal to decide as to the purchase by local authorities outside London of the works of distribution within their district, and also to decide as to the supply of water in bulk to such outside authorities; and to pay for the undertaking by stock having the ultimate security of the county rate.

KEGWORTH SEWERAGE.—A Local Government Board inquiry was held on Wednesday, 21st inst., at Kegworth, by Major-General Carey, R.E., with respect to an application for sanction to borrow £5,000 for sewerage and sewage-disposal purposes. Mr. W. H. Radford, C.E., of Nottingham, is the engineer for the scheme, and he explained the plans. It is proposed to construct new pipe sewers to deliver the sewage by gravitation to the sewage-disposal site, where it would be pumped a lift of about 12ft., and purified by broad irrigation on eight acres of suitable land.

CHIPS.

A group of class-rooms and offices is about to be added to the Rochester Grammar School for Girls, from plans by Mr. J. W. Nash, of that city.

An Oddfellows' hall has just been built at Thetford, on the site of a schoolroom in Earl-street. It is red bricks, with stone dressings. Mr. S. Holden, of Station-road, Thetford, was the builder, and Mr. Remnant, of Bury St. Edmunds, the architect. The cost was £1,100.

St. David's Welsh Church at Cardiff was consecrated on Wednesday week. It consists of a chancel 38ft. 6in. by 22ft. 3in.; nave, 67ft. by 24ft. 3in.; and north aisle, 67ft. by 11ft. 6in., and vestry. The church will seat nearly 500 people, and cost £4,500. Mr. E. M. Bruce Vaughan is the architect. The reredos is of Caen stone, made by Messrs. Jones and Willis.

A peal of six bells, cast by Messrs. Taylor and Co., of Loughborough, was dedicated in Llandygwydd Church, in Tivyside Valley, on Wednesday week.

A meeting was held at Chester on Tuesday week, the chairman of the Flintshire County Council presiding, to consider the advisability of constructing a bridge over the Dee at Queensferry. It was resolved to push on with the project for a swing bridge, which is estimated to cost £10,000. There will be an additional £2,000 for constructing the approaches, and a private Act of Parliament must also be obtained.

The Leeds town council have adopted a scheme for the drainage of Rodley district, with a separate disposal on the broad irrigation plan, prepared by their engineer, Mr. Thomas Hewson.

At a meeting held at Thetford last week, it was decided to proceed with the restoration of St. Peter's Church, in accordance with a report prepared by Mr. Edward Boardman, of Norwich. The estimated cost will be £1,000.

The London County Council on Tuesday resolved, by 90 votes to two, to take steps for acquiring the undertaking of the London Street Tramways Company. By a majority of eight they also declared that they had no intention of working or seeking power to work the tramways.

The Mayor of Warrington laid yesterday (Thursday) the foundation-stone of the new corporation baths in that borough. The new baths will be an extension of the present ones, and will cost about £5,000. They will include a new swimming-bath, with a water-space of 73ft. by 43ft., as well as shower, soap, and vapour baths.

As a number of men in the employ of Mr. Ralph Clarkson, of Bolton, were engaged demolishing the ruins of Prestoke Chemical Works, near Bolton, on Tuesday, a building collapsed, and three of the workmen and a bystander were killed immediately. Mr. Richard Clarkson, brother of the contractor, was one of those who lost their lives. About 400 tons of *débris* have fallen.

Our Office Table.

THE dean and chapter of Norwich Cathedral have received a memorial from resident householders in the Close, expressing surprise and regret at the proposal to lease for building purposes portions of the Lower Close. They urge that such a course is for many reasons to be strongly deprecated. The erection of such buildings would shut out the sun and air from the lower square, and destroy one of the most admired and picturesque views of the cathedral. Other parts of the scheme would greatly curtail the open spaces nearer the river, upon the possession and preservation of which around the cathedral Norwich has been frequently congratulated. The land lies too low for healthy residential purposes, and building sites much more eligible for sanitary reasons than the Lower Close are available in any quantity. The memorialists ask that the entire scheme may be abandoned.

MR. GEORGE WALLIS, F.S.A., who only retired a fortnight since from the office of Keeper of the Art Collections at South Kensington Museum, died on Saturday at his residence at Wimbledon, in his eighty-first year. Mr. Wallis had been in failing health. His busy life had been wholly devoted to the promotion of art instruction. As far back as 1841 he was connected with the Government School of Design at Somerset House, the foundation of the Department of Science and Art. In 1843 he became the master of the Spitalfields School of Art, and in the same year went to Manchester as head master, a position he resigned three years later. For several years from 1846 Mr. Wallis was engaged in the advocacy of schools, museums, and exhibitions; he was prominent in the conduct of the Great Exhibition in 1851, and at its close was sent to Birmingham to reorganise the school of art, a matter in which, as head master for several years, he rendered essential service, and attained marked success. In 1853 Mr. Wallis was one of six commissioners appointed by the Government to visit the United States. Mr. Wallis's report on art and art manufactures was presented to Parliament in 1854. During the Great International Exhibition of 1862 Mr. Wallis acted in the same capacity as in 1851, and in 1867 he superintended the British section of the History of Labour in the Paris International Exhibition, and acted upon the juries. In 1858 he joined the South Kensington Museum, where, in 1863, he was appointed senior Keeper of the Art Collections, a position which he filled for 28 years. Two of his sons are now doing in other departments the work which their father did so well at South Kensington—Mr. George H. Wallis, as the keeper of the Corporation Museum and Gallery at Nottingham; and Mr. Whitworth Wallis, who holds the same position at Birmingham.

MR. ANDERSON'S church hat peg, a sample of which has been sent us, is a real aid to devotion, or ought to be, so completely is the usual anxiety of the male worshipper about his tall hat relieved by its use. By using the peg, a hat is preserved from the feet, knees, and dresses of ourselves or neighbours, and may be taken to church without risk, and brought out again free of all injury. The hat is liable to no dust, no danger; but is as safe as in a bandbox. The peg has a gimlet-pointed screw, which does not require a hole to be bored for it; but can be fixed by anyone in a few seconds, and a star-shaped rubber washer prevents the hat from slipping. Buy one at once—the cost is only a shilling—take it to church next Sunday and leave it there, and any sensible churchwarden will bless you for the hint, and adopt it at once throughout the edifice.

MR. GEORGE SIBLEY, C.I.E., Memb. Inst. C.I., F.R.G.S., died on Sunday last, at his residence, The Mount, Whitehill, Caterham, at the age of 67. On leaving University College School he was apprenticed to his father, an architect and civil engineer in London. In 1845 he was employed upon the Bristol and Exeter Railway, under Mr. Brunel, and afterwards under Sir Charles Hutton Gregory. In 1851 he went to India, and was engaged upon the East India Railway, under Mr. James Meadows Rendel. He gradually worked his way up, and in 1859 became the chief engineer of the North-Western Provinces Division, and, in 1868, chief engineer

of the whole line of 1,500 miles. He retired from the service and from the profession in January, 1876. Among the more important works constructed under his supervision was the Jumna Bridge, Allahabad, which was completed in 1866, and was, at that time, the largest bridge existing, being supported on 14 piers, and having a railroad above and a carriage and footway beneath. Mr. Sibley joined the Institution of Civil Engineers as an Associate in 1850, and eight years afterwards became a full member. He was the author of several contributions to scientific, engineering, and geographical journals, and it is understood that he has left a considerable legacy to the University of Calcutta for the purpose of founding engineering scholarships for the encouragement of native engineering students. He was nominated a Companion of the Order of the Indian Empire.

Mr. Deputy Edmeston, F.R.I.B.A., in a letter to a City journal, expresses his disapproval of the policy of laying down wood paving, on the score of the offensive odours it emits from being saturated with horse-manure. As he points out, it is of great importance to prevent water stagnating between the blocks, and even at the best it is absolutely necessary to constantly and liberally apply deodorising chemicals, while the blocks should, as Dr. Sedgwick Saunders suggests, be well impregnated with tar or chloride of mercury.

The first iron suspension bridge has just been constructed in Iceland. It spans the river Oloussa, near Reykjavik, the capital, and is 372ft. long by 9ft. wide, and 27ft. above the stream. The contract was taken by Mr. Tryggvi Gunnarsen, an Icelandic merchant, who relet it to a firm in Newcastle-on-Tyne, Messrs. Vaughan and Dymond, and Mr. Vaughan himself went over in June last to superintend the erection, with workmen from England. All the materials had previously been transported on sledges over the ice during the winter from the next harbour, Eyrarbakki. The six steel wire ropes, weighing $5\frac{1}{4}$ tons each, and 430ft. long, were carried upon the shoulders of 180 men, and took two days in transport from Eyrarbakki to the site of the bridge, a distance of about nine miles.

The tendering for the new Ramsgate front road improvements was of a very close character. With the exception of two tenders, which were evidently not meant for competition, they varied from £35,600 to £45,948, the average of the whole being £39,801, against the engineer's estimate of £39,149 for this part of the work. This speaks well for the correctness of the drawings, specification, and quantities. It will be remembered that the engineer's estimate for the total structural work was given in the first instance at £45,000, which sum was increased to £48,047 at the desire of the quantity surveyors, Messrs. Hovenden and Berridge, so as to leave a safe margin. By the price of the accepted tender, however, it seems that the original estimate of the engineer will not be exceeded.

Mr. John Wills, F.S.Sc., architect, of Derby, Eng., who is a delegate to the Methodist Œcumenical Conference at Washington, D.C., addressed a meeting of Methodist ministers in Toronto recently, says the issue just to hand of the *Canadian Architect*, on the subject of "Methodist Church Architecture." He also exhibited a number of his own drawings from which churches have been erected in different parts of England. Mr. Wills recommends that there should be at least four means of egress for all large churches. He thinks the Gothic, properly and carefully adapted to modern forms of worship, the most appropriate style of church architecture. He is of the opinion that the situation of the organ and choir should be either behind the minister or in the same end in one of the transepts. Concerning methods of heating, his preference is for the hot-water low-pressure system.

At a largely attended public meeting, held in the town-hall, Belfast, on Saturday last, under the auspices of the Ulster District Council for the National Registration of Plumbers, the following resolutions were passed:—"That this meeting is of opinion that an efficient system of registration of plumbers is essential to the protection of the health of the community, and, such a system having been established by the Worshipful Company of Plumbers, London, we believe the time has arrived when application should be made to Parliament for powers enabling a national council of competent jurisdiction and authority to take measures for promoting the technical education of plumbers, and regulating the practice of those registered." "That this meeting, having considered the Bill promoted by the Worshipful Company of Plumbers, hereby express their general approval of the principles of the same, and resolve to give it their hearty support." The clerk of the Plumbers' Company attended, and fully explained the objects of the Bill in question to the meeting.

CHIPS.

The deadlock between the contractors (Messrs. Lucas and Aird) and the directors of the new West Highland Railway is now at an end, a satisfactory settlement having been come to between the parties. The work is to be vigorously carried forward.

Mr. Felix Joseph has presented to the Derby Art Gallery specimens of old Derby Crown china, representing various periods of its manufacture. The gift is worth at least £3,000. In recognition of his munificence, the Town Council held a special meeting on Tuesday, and presented Mr. Joseph with an address, together with a handsome collection of the Royal porcelain at present manufactured in the town.

The new workhouse infirmary, Grantham, is being warmed and ventilated by means of Shorland's patent Manchester stoves and exhaust ventilating shafts, the same being supplied by Mr. E. H. Shorland, of Manchester.

The tower of Waddesdon parish church is being rebuilt from plans prepared by Mr. W. White, of Wimpole-street, London, W., the contract being taken by Mr. H. H. Sherwin, of Waddesdon. Mr. J. Beer, of Brixton, is the clerk of works.

The American Institute of Architects has been holding this week its twenty-fifth annual convention in the city of Boston, Mass. The congress began on Wednesday, and will close to-day (Friday).

The Huddersfield town council have appointed Mr. W. R. Herring, of Hastings, as assistant gas manager at a salary of £300 a year.

A new Roman Catholic Church is being built at Tranent, from plans by Mr. John Beggar, of that town.

A London correspondent states that Lord Esher, the Master of the Rolls, has erected a family tomb in Esher Churchyard with marble figures of himself and Lady Esher, both of whom are happily still in a position to apply the moral of this sermon in marble.

The death is announced of M. Vincent Labouret, architect of the Ministère des Affaires Etrangères, the Hôtel de Louvre, and the Grand Hôtel, Paris. He had much to do with the new portions of the Louvre. He was seventy-six years of age.

Three new lancet stained-glass windows have just been placed in the chapel of Ratcliffe College, Leicester. The first represents St. Robert, Abbot, the second St. Richard of Chichester, and the third St. Aloysius. All three windows were executed by Messrs. Hardman, of Birmingham.

At the Norwich Bankruptcy Court on Tuesday week the bankruptcy was closed of Wm. Evans, of South Walsham, builder and contractor. The liabilities were £1,800 3s. 10d.; the deficiency, £850 1s. 4d.

The annual report of the directors of the Metropolitan Industrial Dwellings Company (Limited) states that the gross revenue for the year has been £13,989, and the net profit £2,559. The directors recommend the payment of a dividend for the half-year at the rate of 5 per cent. per annum. The directors have recently purchased property situated in the densely-populated district close to the Tower, and known as Royal Mint-square.

At the meeting of the Middlesex County Council, on Friday, Mr. H. R. Williams presented, on behalf of the subscribers, a life-size portrait of Lord Strafford, the Lord Lieutenant of the county, which had been painted by Mr. Percy Bigland.

The memorial stone of new Catholic day-schools has been laid at Longsight, Manchester, by Sir Henry Roscoe, M.P. The schools are erected in Richmond-grove, consist of two stories about 100ft. by 35ft., are faced with Ruabon stocks, and accommodate about 500 children. The contractors are Messrs. Wilson and Toft, of City-road, Manchester, and the architects are Messrs. Heathcote and Rawle, of 6, Princess-street, in the same city.

A new Masonic hall has been erected at Bridgend, and special attention has been paid to the ventilation, the latest improved form of Messrs. Robert Boyle and Son's patent self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

MEETINGS FOR THE ENSUING WEEK

Monday.—Royal Institute of British Architects. Opening address by the President, J. MacVicar Anderson. 8 p.m.
Society of Engineers. "Corrosion in Steam Boilers," by J. H. Paul, B.Sc. Westminster Town Hall. 7 30 p.m.
Tuesday.—Glasgow Architectural Association. "The Stones of Venice," by L. D. Penman. 8 p.m.

The Architectural Association, 9, Conduit street, W., and 56, Great Marlborough-street, W.

The Architectural Association Courses of Lectures and Classes and Studio Instruction are now being carried on. The Courses are both elementary and advanced, and are designed to provide a sound professional architectural education, supplementary to that to be obtained by the prevailing system of pupilage. The Courses also serve as a means of preparation for the Intermediate and Final Examinations of the Royal Institute of British Architects. The Course, which is divided into four years, is progressive and consecutive, and the instruction is given by Lecturers and Instructors of known ability.

First Year.

LECTURES AND CLASSES.—The orders of Greek and Roman Architecture, Building Materials, Geometry, Physics, Perspective, Mensuration, Chemistry, Geology.

THE STUDIO.—Drawings from ancient examples, Freehand Drawing, Drawing examples of Construction, Plane Geometry and Perspective, Sketching and Measuring.

Second Year.

LECTURES AND CLASSES.—English Architecture, Principles of Construction, Strengths of Materials, Land Surveying, Chemistry of Building Materials, Elementary Ornament and Colour Decoration.

THE STUDIO.—Designs based upon ancient examples, Freehand Drawing, Drawings of Elementary Construction, Solid Geometry, Sketching and Measuring.

Third Year.

LECTURES AND CLASSES.—The History of Architecture, Materials, Stresses and Strains, Specifications and Quantity Surveying, Ornament and Colour Decoration, Sanitary Science, Elements of Natural Philosophy.

THE STUDIO.—Design of modern Buildings, Freehand Drawing from Casts, Perspective and Sciography, Constructive Masonry, Modelling, Elementary Water-Colour Drawing.

Fourth Year.

LECTURES AND CLASSES.—The History of Architecture, Materials, Sanitary Science, Measurement and Valuation of Building Materials, Professional Practice, The Arts Allied to Architecture.

THE STUDIO.—Design of Modern Buildings, Freehand Drawing from Casts, Graphic Statics and Perspective, Modelling, Water-Colour Drawing.

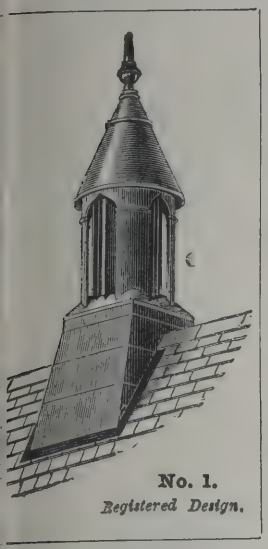
A pamphlet containing full particulars of the Curriculum and Fees may be obtained free on application to the Hon. Secretaries, at 56, Great Marlborough-street, London, W.

ERNEST S. GALE
F. T. W. GOLDSMITH } Hon Secs

Mr. F. T. Maltby, Assoc.M.Inst.C.E., engineer and surveyor to the Dorchester Corporation, has been elected by the council to the office of borough surveyor, Guildford, at a salary of £300 per annum. There were 154 candidates for the appointment.

The new pier at St. Leonard's was opened on Wednesday by Lady Brassey. The cost of the undertaking is about £30,000. The pier starts from the parade opposite the Western Colonnade and is carried out on three clusters of piles to the pavilion enlargement, which is only 200ft. from the parade. From this point the deck is carried out on six groups of piles to the pierhead, the total length being 950ft., a few feet longer than Hastings pier. Mr. Richard St. George Moore, A.M.I.C.E., Westminster, was the engineer.

At Tuesday's meeting of the Bristol city council a motion relating to the duties of the city surveyor was brought before the council the question of requiring officers of the corporation to devote the whole of their services to the city. This matter has been discussed in Bristol on several occasions, and the principle has been generally admitted, but in the case of the city surveyor there has been this difficulty—that the members of the council were not prepared to pay Mr. Josiah Thomas such a salary as would induce him to relinquish a very remunerative private practice which he has undertaken privately with the consent of the corporation. A definite statement was in fact made on Mr. Thomas's behalf, to the effect that he would be willing to give up his private practice. The rearrangement of the duties now assigned to the city surveyor and borough engineer, was referred to the Finance Committee to report upon to the council.



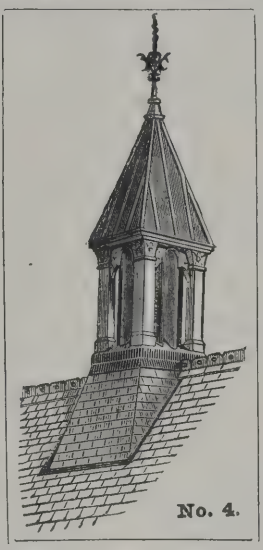
Mr. Wilson Weatherley Phipson, M.Inst.C.E., of John-street, Adelphi, and Long Clawson, Leicestershire, died very suddenly on Wednesday week, aged 53 years. Mr. Phipson was educated in Brussels and Paris, where, through the instrumentality of Earl Cowley, his father was enabled to enter him as a student at the Ecole Impériale des Ponts et Chaussées. After having done some work in Paris, Bordeaux, and Holland, connected with the heating and ventilation of hospitals, he came to England. There are few public buildings of modern date in Great Britain on which he has not been engaged in conjunction with many of our leading architects, more especially the Royal Albert Hall, the University of Glasgow and Edinburgh, the Natural History Museum, the Institution of Civil Engineers, &c. He had been a member of the latter institution since 1878, having nine years previously joined that body as an Associate.

ROBERT BOYLE & SON'S

Latest Improved Patent

SELF-ACTING AIR-PUMP VENTILATOR.

50 PER CENT. REDUCTION IN PRICE.



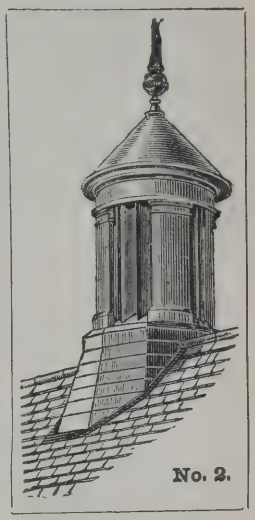
No. 1.
Registered Design.

The most Powerful Exhaust and

CHEAPEST VENTILATOR IN THE MARKET.

IMPERVIOUS TO WET AND DOWN-DRAUGHT.

Strongly made of the Best Steel, Galvanised, and Finest Workmanship.



No. 4.

CAUTION TO ARCHITECTS.

FRAUDULENT SUBSTITUTION.

Having received complaints alleging the failure in certain cases of the Air-Pump Ventilator, upon examination being made it was found in every instance that the contractor had substituted (to secure a greater profit to himself) a cheap and inferior Ventilator resembling, in outward appearance, the Air-Pump Ventilator which had been specified to be used.

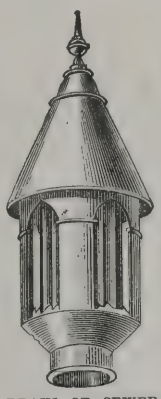
It is respectfully requested that, in specifying the Ventilator, the words "ROBERT BOYLE & SON'S LATEST IMPROVED PATENT SELF-ACTING AIR-PUMP VENTILATOR" be used.

No. 2.

ROBERT BOYLE & SON'S

Latest Improved Patent (1882)

OIL PIPE, DRAIN, & SEWER VENTILATORS.

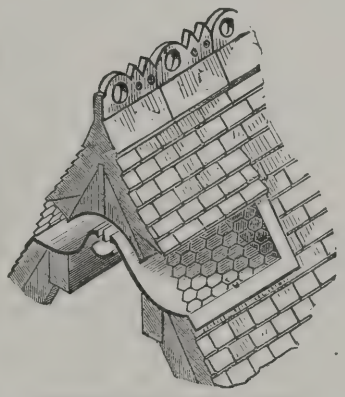


The Cheapest and most efficient in the Market.

FROM **12s.** EACH.

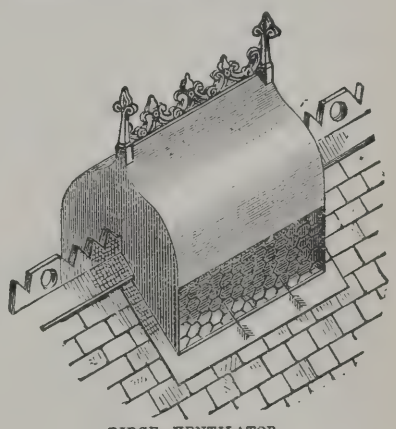
Approved of and used by Baldwin Latham, C.E., Bailey-Denton, C.E., W. Eassie, C.E., and by all the leading Architects, Sanitary Engineers, Builders, and Plumbers in the United Kingdom.

OIL PIPE NTILATOR.



DRAIN OR SEWER VENTILATOR.

ROBERT BOYLE & SON'S



Latest Improved Patent (1882)

WAGES MOVEMENTS.

Aberdeen.—At a meeting on Friday night of operative plumbers in Aberdeen, a letter was read from the Masters' Association declining to grant 1d. per hour increase for reduced time from November 1 till February 28, making the hours 46 instead of 51, and it was resolved, as the masters refused arbitration, to strike on Monday next.

The Arbitration in the Carpenters' Dispute.—Mr. J. MacVicar Anderson, P.R.I.B.A., the arbitrator in this case, held his fourth sitting on Tuesday afternoon at 9, Conduit-street, W., when the arguments for and against the chief points in the memorial were raised, and evidence having been called, the matters in controversy were fully discussed. A final sitting will take place on Tuesday afternoon, when the arbitrator will receive evidence as to the hours and rates of wage in the other building trades. The award is expected to be given at a very early date, and while, of course, no estimate of its probable purport can as yet be formed, both master builders and men are alike to be congratulated upon the expeditious and exhaustive mode in which the reference is being conducted.

CHIPS.

The London and South-Western Railway Company intend to apply next session for powers to construct an electrical railway in a subway from Waterloo to the City.

Considerable progress has been made with excavations now being carried out for the Marquis of Bute, under the superintendence of Messrs. Kempson and Fowler, of Llandaff, on the site of the old Blackfriars Monastery, which is within the grounds of Cardiff Castle. Many parts of the old foundations have been traced, a piece of the original consecrated altar slab has been found, also many interesting fragments of tombs, pieces of worked stone, glass, tiles, &c., all of which are being carefully preserved.

A new church is about to be built at Middleton-cum-Stourton, near Leeds. The site is in the Pontefract-road, and the architect is Mr. C. Hodgson Fowler, F.S.A., of Durham.

The foundation-stone was laid on Thursday of a new home for incurables at Spital Tongues, Newcastle-on-Tyne. It is being built for the corporation of that city out of charity funds at a cost of £13,000, and will house 68 patients. Mr. Edward Shewbrooks, of Newcastle, is the architect, and Messrs. Middlemiss Brothers are the contractors; Mr. David Reid is the clerk of works.

Two memorial brasses were uncovered on Tuesday in the south-east, or Artists' Corner, of the crypt of St. Paul's, to mark the place where Sir Edgar Boehm, R.A., was recently buried. One is a massive brass which covers the grave, and the other is fixed in the adjoining wall at the head of the tomb. The middle panel of the first brass contains a cross, with the name and date of birth, and the words which were suggested by the Queen, "Died at his work." The panel above contains the Bohemian coat of arms of the family, and the bottom shows Sir Edgar at work on a bust.

Holloway's Pills.—These famous medicines are blood renovating remedies, whose influence reaches the great centres of the nervous system, purifies the circulation, induces a healthy state of the bodily powers, gives tone to the stomach and brain, producing a desire for food, and all the proper requirements for health and vigour.

HAM HILL STONE.

The attention of Architects is specially invited to the Durability and beautiful Colour of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.

ASYLUM PLANNING.

ITH the exception of works on hospital construction, which in several im-tant particulars involve principles of ign that are equally necessary for lums, we have scarcely any treatises ich give information about this latter d of building. No doubt this want is tly owing to the experimental stage ough which asylum construction is pass-, and the very little knowledge of build- possessed by those who have made ntal diseases a special study, for to be e to lay down reliable principles for build-s of this character, it is necessary that the hor should not only be well acquainted h the mental condition and requirements insane patients, but be competent to ody them in a concrete form, and with nical knowledge of building. Very combine the requirements of hygiene, inistration, and structure. Till within last few years the construction of hos-ls was little known outside the circle of erts, because only those acquainted with principles of hygiene and administration ld properly deal with the subject, and same combination of attainments is essary in discussing asylums.

he main difference between a hospital an asylum for the insane has to be t in view. The former has to provide a large number of patients who have to p their beds; the dormitories must be modious, as a great many are put in one n; but in the asylum the day-room omes the most necessary provision, and sleeping accommodation must be largely ined by single-bedded rooms. This re-ement renders the planning of an um more difficult: a large portion of area of each block has to be ropriated to single bedrooms, and e have to be arranged so as to afford supervision and ready access to a mon day-room. For the purpose of architect, the subject may be considered er the following heads: 1, the principle rrangement of the blocks; 2, the plan- of each block as a unit in the design; ne administrative department and other ils. Our object now is not to enter into of those questions with any methodical pleteness, but to draw attention to a few ne essentials. Recent buildings of this s have shown a variety of plan, from a ple linear distribution of the blocks to drangular and the broad-arrow forms. w recent asylums have been arranged uadrangles, with the main blocks facing h, the end blocks east and west, and the inistration block on the north side. It serted by competent authorities that this llelogramic disposition of the blocks its of easy supervision, and the whole of uildings can be brought together in a pact form. Another modern development sylum planning is that in which the ks all arranged in *échelon*, that is, step- the whole arrangement resembling with a centre and two oblique arms or s or a broad arrow. Many large ms have been built on this form; but ctions have been urged against it, one that supervision and control are more ult. The *rationale* of this plan is that ables the blocks to be arranged economi- on the ground at the same time as it s each block to obtain the right aspect ut interference with those behind it. recently-erected Claybury Asylum, Essex, illustrates this principle. It is being built for 2,000 patients—1,200 females and 800 males—the former are provided in blocks on the east side, and the males on that of the west, and these blocks are arranged in *échelon*, that is, along the outer sides of oblique corridors. The chief point is to obtain easy access from either the male or female sides, or wings as we may call them, with the administrative offices in the centre. To accomplish this, it is necessary that there should be a corridor across from each wing to the administration block, about midway between the two ends of each wing, the areas so cut off from the sloping wings, and the central block being used as airing-yards, as in many recent asylums. One authority, Dr. Richard Greene, the medical superintendent of the Berry Wood Asylum, Northampton, in a useful paper read before the late International Congress of Hygiene, describes five ways in which the blocks may be arranged. First, the blocks may be placed on either side of a straight corridor of communication; second, they may be disposed in the broad-arrow form. Here the straight corridor is bent at its centre, and the blocks arranged in *échelon* with the administration-block at the junction. Third, they may be arranged in the form of the letter H, the blocks being attached to the free sides of the letter—an objectionable form; fourth, they may be arranged in quadrangles or parallelograms, the important blocks facing due south, and the other blocks having their ends south, and their sides east or west, the administration portion being to the north. Fifth, arranged on the horse-shoe form of corridor, the blocks placed round the outer edge.

Of these several forms Dr. Greene appears to give preference to the first, or "linear" arrangement, if not too strictly interpreted, the less important wards being placed in *échelon*, and to the quadrangular and horse-shoe arrangements; of the last of which, he says it is probable that this principle will be developed into the best plan of all. With regard to the *échelon* arrangement the same author thinks it is better adapted for a hospital than an asylum, as in large asylums the difficulty of supervision is great, and he thinks it not suitable for asylums exceeding 300 beds. Of course, every architect must use his own discretion; a great deal will depend on the shape and aspect of the site and the fall of the ground, as to which distribution is the most desirable. Many excellent buildings have been planned on the "linear" in combination with the *échelon* principle, where the site is extensive and other considerations are favourable. We believe the latter plan is a good one as regards the essentials of aspect, light, and air to each ward or pavilion, and provided also that easy reach of the administrative centre is kept in view.

Having decided upon the general arrangement, the next and equally important thought is: What is the best form of block? Now, both general arrangement and plan of block should be studied simultaneously—in fact, the idea of the "block" as the unit must be in the architect's mind while he is thinking of the distribution on the site. The block is, then, a very important consideration is asylum planning. It is generally agreed by all authorities that these should not, if possible, be more than two stories in height, and many think a one-story building is the most efficacious, as Dr. Greene observed at the Congress. He says: "I have no hesitation in stating that an asylum should never exceed two stories in height, and if any part of an asylum be three stories in height, the whole building may be described as faulty and unsuitable." As regards staff management, comfort of patients, and carrying out principles of modern hygiene, he observes, a one-story building is the best. We have no reason to dispute this fact; but circumstances and the value of land would render single-story asylums almost impossible. On this point, however, it is right to mention that Dr. Greene observes a one-story building for 500 or 800 patients would not require more ground-space than one of two stories for 1,000 or 1,600 patients, and many of our public asylums exceed the latter number. He thinks that no asylum should have more than 800 beds, and we believe those who have experience of the working of these institutions would agree to such a limit. In plan, the patients' blocks may consist simply of a parallelogram, with the attendants' and single rooms ranged along the back wall, and the remaining portion towards the south, forming a wide corridor or day-room, with bay windows. In the Plymouth Asylum, designed by Messrs. Hine and Odgers, of which we gave a ground-plan (March 7, 1890), this kind of block is used. There is one on each side of the central block, devoted to recent and acute cases. Let us take one of these. Nearest the centre block is a spacious entrance lobby, one end opening into the dining and recreation hall, which forms a projecting centre block in the front, and the other end of lobby opens into a wide corridor, lighted by windows to the south, with single rooms behind. A bay window, or recess, projects from the centre of the corridor. At the other end of patients' block is a day-room at right angles, making a slightly projecting wing corresponding to the lobby entrance, and a dormitory with single and attendants' rooms forms a receding wing. A little in rear of this comes a second block used as an infirmary ward, having a similar arrangement of corridor, with single rooms and day-rooms, and an epileptic ward or dormitory at right angles, so that we get something like the *échelon* plan. The other side of centre administration is a repeat. The lavatory, bath-room, and closets together make an isolated building behind each block. Each block is of two stories, the elevation simply consisting of the bay window of corridor the end of day-room hipped as a wing, and the projecting lobby entrance at the other end corresponding. The large dormitories at the ends of each block have windows on each side. The male patients are located on the west side, and the female on the east; the axis of administrative building runs due north and south. To sum up, one block may be a parallelogram divided longitudinally, the front portion facing south, as a corridor for recreation, and the back portion towards the north be divided into single rooms with conveniences projecting behind. At right angles to this parallelogram, at one end is a dormitory, the south end of which is a day-room in range with the corridor. One merit of such a plan is that it places the day-room towards the south with ample windows, and the dormitory is made a retiring wing, parallel to or at right angles with the same, and this mode of setting back produces a kind of *échelon*. This corridor principle admits of a continuous day-room along the best front, and can be broken by large bays. For the sick and infirm patients, who are often bedridden, it is desirable to make the dormitory face the principal aspect, and to place the day and single rooms in a return wing running north and south. For acute cases, an agreeable aspect is, on the other hand, essential in the day-rooms, and the same remark applies to chronic cases. One good form of block is that of the letter ⌴, the lower part of which represents three day rooms, the end ones coming out a little as wings, with bay windows on each front, and the two sides would represent single rooms, with a centre corridor access. Each of these patients' blocks will include an attendant's room, placed at the end of every dormitory and day-room in an accessible position, a bath-room, lavatory, w.c.'s, store-room,

boot-room, ward scullery, slops and brushes, coals. In many large asylums the blocks for acute and chronic cases are of three stories. Other plans of blocks will suggest themselves to the architect; his main care will be to see that the day-rooms receive plenty of light and air, with cross ventilation for the dormitories. As regards size, the latter can be made large enough for 100 beds; but those which hold 20 or 30 beds are preferred. About one-fourth of the dormitory space may be appropriated for single rooms. In county asylums 600c.ft. is given to dormitory, and 480c.ft. to day-rooms, making 1,080ft. in all. The floor area is calculated at 50ft. for the dormitory, and 40ft. for the day-room, and this allows a height of 12ft.; but these are details to which we may again refer.

Five classes of patients have to be considered: the sick and infirm, acute cases, epileptic, chronic, and laundry patients. These have to be disposed in the most desirable manner. Recent and sick and infirm blocks are those which demand careful consideration and watchful attention, and should be located on the south side or near centre, whereas the chronic cases and epileptics may be in more retired positions. In large establishments, workshops for male, and laundry buildings and sewing-rooms for female inmates must be provided round one of the rear or north airing courts on either side; the sewing-room should be in connection with the laundry patients' block. The medical superintendent's house might be placed near the centre in front on one side of the chapel, which is often made to form a prominent building, on the axis of the administrative block on the south side. Corresponding to the medical superintendent's block may be the waiting and board-room, superintendent's offices forming an entrance block. On the upper floor accommodation for assistant medical offices. Attendants and nurses for both sexes must be provided for by blocks in convenient positions on both sides of the administration centre buildings, and they may face the airing courts. Nurses and attendants ought to have ready access to the central and main corridors, with mess and day rooms and bed-rooms on the upper floor. It is needless to say that a complete plan ought to have a large recreation hall in the main administrative block, with a serving room communicating, with the kitchen on the north, and a scullery. There should be a stage fitted up at one end of the hall, with corridor entrances. The usual hospital arrangement of kitchen and offices may be followed in the administrative block. Many very complete buildings have been erected during the last twenty-five years for the insane poor. They are often situated in the most beautiful parts of the country, and the grounds are often laid out in the most attractive manner. On the planning and general distribution of the blocks very much depends. We must leave the consideration of details to another opportunity.

INSTITUTE OF PAINTERS IN OIL COLOURS.

SMALL and unimportant pictures may sometimes swamp a good collection, and this thought will no doubt be that of many who view the exhibition of oil pictures at the Institute in Piccadilly. There is much, however, on the walls that sufficiently counterbalance this idea; the landscapes are numerous and strong, while of the subjects of the *genre* class, many examples will meet with admirers. In the west gallery are hung several clever pictures of the latter kind. "Starting the Race" (118), by John White, is full of that natural English village life which is always popular with those who regard painting as a mode of transcribing closely and observantly. The sailor, whose jocular face and hand laden with oranges bespeak play, has collected a few village urchins together, and is about to witness a scramble. Three sturdy little fellows are standing in line ready to run, while one is tying up his boots. A group of village maidens at the pump, others at their doors, are merrily looking on. The bright, clean, plastered cottages, and the drawing and colour generally, make up a pleasant picture full of expression. T. B. Kennington's "Mischief," three bewitching maidens (108), is a study which was the least expected from the painter's known *penchant* for the gloomier features of life. The young ladies are in the best of spirits, and are, no doubt, plotting some little trick at the expense of someone. Their mischievousness is written in all three faces, which are all of the dimpled, "sweet-seventeen" type, decidedly pretty, especially the expressions on the visible centre and right-hand countenances. The colour and light are admirable. From this playful trio we may turn to Walter J. Cox's "Discharged," a picture of pathetic interest, such as we might have looked for from the last painter. The dejected husband seated in a chair, his head bowed down, his bag on the floor; the heart-broken wife at the fireplace, and the unconcern of the children enjoying their meal, are truthfully painted with a keen insight into the humbler phases of life. A figure subject of much power is Miss Elizabeth Nourse's "So dear a life your arms enfold"—a mother with her child in her arms, and cradle at side. A contrast is presented by Miss Henrietta Rae's "Memories," in which a young lady in evening attire sits at the piano touching the keys awakening a chord of reminiscences. The light of day and the lamp light seem to be struggling for mastery; the latter illumines the figure with a warm glow, which contrasts with the cold blue shadows around. The painter has succeeded in investing her subject with a glamour of its own; there is a fascinating charm in the elegant figure and the prismatic hues of the colouring, but the glass spoils the effect. C. N. Kennedy's "Close Hauled" (43) is a dexterous piece of handling and colour; the seaswept vessel, with the man at helm clutching for life's sake at his post, is masterly. Of less importance are the pretty little works of "Awake and Asleep," a child with cat and doll (13), by Carlton A. Smith; Thos. Davidson's "Heathcliffe and Catharine Linton" (55). Solomon J. Solomon (87) has a clearly-painted and modelled recumbent figure of a man's head and shoulders, with half-light. The face, which is upturned, is not pleasant. One of the most classically conceived subjects is "Pythia" (97), by the Hon. John Collier. The girl oracle, clad in green and dark red draperies, holds a bronze bowl in one hand and a twig of evergreen in the other, and, seated on her tripod, is inhaling the vapour which arises from a chasm in the ground. Her eyes are closed. The painter has thrown a spell of mysticism round the subject, which is treated with much skill and power. Other figure subjects include a beautiful angelic face, or half-figure, of a young maiden holding in her hand a cross, by William Wontner (129), full of spirituality and expression; and a nice study of the side face of a girl, "Phyllis," by T. Cowper, who also sends "Daphne" (1), another study of heads.

The landscapes are numerous. E. M. Wimperis, at the end of room, exhibits "A Yorkshire Moor" (54), which for breadth, freshness, and colour is one of the strongest. The stormy clouds and the broken ground, intersected by watercourses and stunted herbage, is vigorous and truthfully painted. Two other landscapes, "Going to the Peat Bog" (440) and "A Moorland Road" (567), are equally breezy and strong. Yeend King's "Mill Pool" (81) has the fault of over-greenness and lack of shadow. James E. Grace in "Untrodden Ways," is a large conspicuous example of half moss and wo land, to which we may add Chas. J. Lew "Old Fishing Village" (3), full of hazy s light; J. Clayton Adams's study of g on a common (4); W. W. Caffyn's "Br and Wild Flowers" (23); Edgar Barcl "Ring-a-Ring of Roses" (20); D Murray's "View of the Rother" (1 Alf. W. Williams's "Ewhurst, from L Hill, Surrey." J. L. Pickering's "Heart Oak," a road wending through a wood, a heavily laden timber waggon making way through a pool, is finely painted much power and feeling. Alfred Ea "A Dewy Morning" (147) is ideal, cha ing in its grey misty atmosphere; and Hughes Stanton's "Struggling Light" is also clever as a depiction of mist light, contrasting with John R. R strong and hard colour, as in 92 and Seascape and coast are well represented the luminous sea, glistening and fresh C. Napier Hemy (167).

A number of small canvases are so what distracting in the Central Gall Among the best of them are T. B. Kenn ton's study of child with a doll (Walter Tyndale's "The Holy Viatic (184); Frank Dadd's "Thirdly and Las —an old-fashioned clergyman in Ge gown chatting to a sportsman in hun scarlet; John H. Lomax's interior (1 G. G. Kilburne's "Sauve qui Peut!" (2 Mrs. J. T. Watts's "Old Farm, Susse Leopold Rivers's "The End of I (220); and Thos. Huson's strong-colo landscape (216). The President, Sir J D. Linton, has two figure-subjects, pying usual positions. "Jessica" is a dark style of beauty, presumably lock's daughter, of course exquisi finish, her corsage jewelled with p and in subdued colours. What is in "The White Rabbit" (358) cannot say, except that it is lessly painted in the details and text the setting of the little girl and her is simple and rather lugubrious; but is a sympathetic interest in the work. sombre, gloomy key a protest agains sensational school of colour? Much in sentiment and colour is C. T. Garl "A Mute Appeal," a little girl ami luxurious accompaniments of a dessert with her dogs. One of the most ple figure subjects is "L'Enfant de Mari Miss Helen H. Hatton (238)—colou expression both agreeable. Several *genre* subjects have rather too much engraving-print-seller motive. Such example, is J. Haynes Williams's cleve ture, "First of April," an 18th centur at a garden gate, who has evidently "fooled" by the young ladies who are ing at him over the wall. Watch in he is anxious, a basket of choice flowe on the ground. Also Edgar Brundy's picture of an old gentleman prepari punch bowl, while a party of gentleme side table are chatting (344). More s as works of art are E. Blair Leig "Society in Solitude" (349), a delig drawn and painted young girl seate window recess or seat reading. The and texture of the dress is inin rendered. "His Birthday," a lady arr flowers in a vase on a handsome loo by Roland Holyoake (372); and a sma delicately-finished subject, "Cave C by W. Paul Davis (290), which for tec is unsurpassed, as in the reflected l the carved cabinet, and the graceful of young lady entering through the casement. Nice pastoral feeling is T. Hope McLachlan's "Solitude" (29 a sense of touching reality in John delightful piece of sea painting, a sea and jetty, "The Last In" (25 landscapes, Frank Walton (239) ser of the best, which is favoured by a

sition; James Orrock has a small study "Windmill," in his own vigorous style; win Hayes's "View of Granton Har-ur" (355); Thos. C. S. Benham's "Breezy eather" (377); R. Thorne Waite's "Hay-d" (362), are other works of broad ndling, tone, and colour. "Entre Nous" a clever bit of *genre* of the popular kind; l so especially is J. C. Dollman's facetious l skilfully-painted "skit" on seaside life, a Malade Imaginaire" (399), out of a st of other works of a similar vein, in ich dexterous painting is bestowed on y commonplace incidents without motive r humour.

As a composition, St. George Hare's 'syche Enslaved by Venus" (477) must be nked among the very few works repre-ting classical myth or legend. "The tered Soul Enslaved by Love" is a utifully half-draped model, her hands ered by links over her head, and having expression of helpless despair. The nical merits are also of a high order. ury J. Stock, in "Sleep and Twilight," sought to allegorise the theme in n and colour—we cannot say unsuccess-y. The purple shadows and drapery are ng, and unpleasantly so, but there is un-bted conceptive power. Many of the t works are to be seen in the east gallery. single out James Clark's Scriptural ire-subject of Leah and Rachel in the tre, for its treatment and colour; the large trait by S. E. Waller, representing amon," winner of the House of Com-ns Steeplechase Stakes, with portraits of . Elliott Lees and his wife, who is at a dow feeding the favourite; Arthur ker's large picture, "Fire Fancies" (536) girl seated opposite a fire receiving the glow, the other parts of the room in shadows, a clever study of firelight; H. Burr's clever, well-lighted picture, mpanions"—a little girl amusing her-with her chickens and dog. Fred. G. man's large landscape, the "Mill am," disappoints as much from its hy colour as its high point of sight, gh the landscape, with its tiled mill and ndering river, taken from a hill, has many uresque elements. The picture is spoilt the glass over it. E. M. Wimperis's at Bog" we have noticed, and we pass to T. Hope McLachlan's vigorous and ic landscape in rich brown, "A Wind the Hill," in which he has skilfully ht the impression of a stormy height sed to tempestuous blasts. Joseph ght's "On the Welsh Coast" (469), a stone cliff; Chas. J. Lewis's "Estuary," early-grey tones (441); Claude Haye's unset through a dark pine wood (513); umonier's view in Sussex; and Edwin e's "Fishing-Boats off Guernsey" (519) pictures that atone for much indifferent . No. 547, "The Honeymoon," by J. nes Williams, is exquisite in finish and nical qualities. The white satin dress te fair bride makes a happy contrast to handsome-faced young husband in silk holding a bouquet of flowers, both ng into one another's faces in the most ome way. James Orrock's "Sand " (555) is full of breeziness and strength. dark, cloudy landscape of J. L. Picker-(533) has also power and breadth, while nother and more sentimentnl mood is 2. Johnson's delightful piece of quiet try life, "The Village Smithy" (541); W. Gilbert Foster's "Breath of Spring," nich the woodland is feelingly painted. e works of characteristic qualities by ate Keely Halswelle are in the col-n.

CLIENTS' ALTERATIONS.

what extent an architect's patience should be allowed to be tried in the ration of plans, mainly owing to the change and vacillation of his client's mind, is not defined by any statute or legal decision; but the very frequent forbearance which has to be exercised by the practitioner in meeting the views of a crotchetty client, who has very uncertain ideas of what he wants, calls for some measure of reparation. Demands made on the architect's time are frequently out of all proportion to the magnitude or importance of the work, and if they were charged for, as they ought to be, by time, the professional fees would be regarded as exorbitant. The client who engages an architect on some paltry building is often the most troublesome and exacting; he expects him to be at his beck and call at any moment of the day, to be ready to discuss matters of trivial consequence, or to inspect goods and wares whenever they are required. Unfortunately, the architect has no remedy but to keep out of the way, or to make a charge that would alarm his client. Another, and worse, tax is to have to do work for a client who has not made up his mind. Sketches and plans are prepared and approved, only to be set aside by some fresh idea, just as everything is in readiness for receiving tenders. New designs are prepared, perhaps again to be altered, and a new set of tenders obtained. The amount is higher than was intended, and reductions are made, and after the works are completed, the employer refuses to pay for the first set of designs, saying that they were of no use to him, without in the least considering that the architect's labour has been expended, and that, therefore, he is entitled to some remuneration. Cases of this sort are very common.

A recent disagreement of this sort came before the Exeter Quarter Sessions the other day. An architect of that city (Mr. A. H. Wills) prepared plans for an extension of premises, which plans were approved and accepted. Unfortunately, tenders could not be obtained owing to a local strike in the building trade. Some months elapsed, and the defendant instructed his architect to make sundry alterations, which were so numerous as to render it necessary to make almost entirely new plans, specifications, and quantities. Fresh tenders were obtained, and one was provisionally accepted after reductions had been made. After this the defendant changed his mind, and the scheme was abandoned, it being alleged on his behalf that the plaintiff exceeded his instructions in obtaining fresh tenders. The jury returned a verdict for the architect for the sum and costs. We have no particulars as to what reductions were made to the plans, or evidence to show whether these were owing to the client's demands or the architect's provisions; but from the verdict given we may conclude that the reductions were mainly owing to the new requirements made by the client. The circumstances of this case are not unusual. The first set of plans are prepared as in this case, and a strike or something occurs to interfere with the carrying out of the design, but no fault of the architect is alleged. During a short interval the client changes his mind: he sees something he likes better, or a suggestion of someone makes him inclined to depart from his original scheme. Several alterations are ordered to the plans, which cannot be made without recasting the whole plan. Is it reasonable for the client to expect his architect to forego all the previous labour entailed upon him by these alterations? And yet the defendant expected him to do so, and to charge nothing for the original set. The abandonment of the scheme is not the architect's fault, if he has followed his client's instructions, and has not unnecessarily incurred expense. This question of making alterations is one upon which some professional decision is required. How many times is an architect to have to submit to these rearrangements and fresh instructions? If he agrees to make certain alterations of a trivial kind, is he to be a second time called upon to make other alterations? Where are they to stop? Certainly fresh instructions which necessitate the preparation of new plans and elevations ought to be considered a second design, and charged for accordingly. A few alterations such as the lengthening or widening of a room, the addition of a bay window, an alteration to a staircase, might be made in a set of plans by a little erasure or sponging out; but when they are such as to entail the redrawing of the plans, elevations, and sections, at least the time and labour ought to be paid for. When the alterations demand a remodelling of the plan, the work should in reason be considered a new design, for which another 2½ per cent. can be charged. We think in any schedule of fees, some limit ought to be defined as to what ordinary alterations are, and a fair charge by time made. These would be such alterations as the client might suggest before the pencil plans are inked in and the quantities finished. After the drawings were inked in and specifications and quantities prepared, any alterations made ought in fairness be charged at a higher rate or as a second design. The frequent disagreements arising from this one cause ought to be a lesson to architects. They could agree to adopt a line of practice that would effectually prevent disputes. Distinct terms for making alterations could be made with a client at the onset, and be introduced in a clause in an agreement between them, a document which, as we have said before, ought to be drawn up and signed before the architect commences his labours, and in which the terms of remuneration, mode of payment, powers of the architect as a general agent, retention of plans at completion, and other matters may be settled.

THE ARCHITECTURAL ASSOCIATION.

THE second ordinary meeting for the present session was held on Friday evening, the President, Mr. F. T. Baggallay, in the chair. The following fifty-three gentlemen were elected as members:—Messrs. J. Richardson, A. R. Hill, F. H. Mercer, R. A. V. Harrison, C. O. Nelson, W. C. Bigg, D. Horn, F. A. Whitwell, W. Hodgers, W. C. Thomas, W. D. Colmer, C. E. Hutchinson, W. Carpenter, A. St. Quintin, C. S. Joseph, T. Henwood, F. D. Clapham, G. E. Withers, A. M. Watson, J. Blyth, S. E. Knott, F. S. Hammond, E. Tylee, T. Ballantine, R. H. E. Hill, R. Angell, R. F. Summers, R. E. Walton, A. Gilbertson, E. W. Lees, W. K. Shirley, A. H. Hawkins, A. J. Johnson, F. A. Meakin, H. V. C. Smith, C. Kensington, A. E. Hodson, W. C. Wood, O. F. Stenning, R. P. Griffiths, T. W. Dinwiddy, E. S. Austen, B. C. Law, E. G. Simpson, M. Zimmermann, W. J. Childs, T. J. Fox, N. W. Harrison, H. P. G. Maull, R. Robertson, E. Whittle, G. C. Beresford, L. Shuffrey, and H. W. Kerr.

The PRESIDENT announced that the committee had, under the rules, nominated a member to fill the office of vice-president, rendered vacant by the resignation of Mr. F. R. Farrow, who had accepted office as a paid lecturer. The committee had very carefully considered the matter, and they felt that, having regard to the great amount of work done for the Association by Mr. Farrow, and the value of his services, without committing themselves to action in the future, they could not do otherwise than nominate Mr. Farrow for the vacancy. (Applause.) The election would take place that day fortnight.

PITFALLS ON COMMENCING PRACTICE.

Mr. W. H. BIDLAKE, M.A., read an interesting paper on this subject. The first great question with the newly-hatched is, he remarked, to get a client. You must have put up a house for somebody before anyone will trust you to put up a house. The wisest course is not to commence until you have secured your first job from an old family friend, or won it in competition. Dead charges must be kept as low as possible. Better to share an office in a good neighbourhood than have a garret to yourself up a break-neck stair-

case; and "taking in washing" for other architects as evening work will pay office expenses better than going to the theatre. When at last a client calls, first impressions are everything; personal dress and manner, evidence of order and system in the office, readiness to grasp ideas, and that indescribable air of confidence in self, which wins the confidence of others. Above all things, beware of unpunctuality; every excuse for it falls flat. It is well to get to know something about your client. Had I done so on one occasion, I should have avoided a pitfall. For my client got more than I did. He got five years' penal servitude, and I only got my expenses as a witness, less 4s. 6d. for the warrant; and with the balance I bought my experience. After giving his ideas, a client always says he has very little money to spend, and wants the work done as cheaply as possible. The reason he says this is because there is a deep public distrust of architects about money matters. He would not be satisfied if you took him at his word. What he requires is his full money's worth in arrangement, construction, material, and design. At the same time, very clearly understand his meaning on the money question, and remember "Cutler v. North." A building enterprise is quite a novelty to him, and he comes to an architect to be told how to set about it, and trusts him to see him through with it without either loss or embarassment. His ideas are often very vague and unpractical. You have to help him to define what he wants. Sometimes you will have to save him from himself, to even assume a kind of authority over him, and say: "That would not do; this must be so." He will come with a pet idea which he has been nursing with pride. You see at once the impractibility of it; but don't contradict him. You may offend, but you will not convince. Best to conciliate with a compliment or a graceful remark, before saying anything unacceptable. If you take his idea, and it is unsuccessful, he will forget its parentage and reproach you with it; or, he will say, and rightly so, 'I came to you, as a specialist, to be advised.' If, on the other hand, his idea is successful, do not be surprised if he takes credit for the whole work, plan, design, and all. Have a distinct understanding about your personal retainer, and the scale of remuneration. If the arrangement is in any way unusual, have its limits well defined. Endorse any verbal agreement by a letter, and keep a copy of it. Some architects regard their clients with feeling akin to antagonism. This is a most dangerous state of mind to begin with, and fruitful of evil. Your relationship with your client is intimate and confidential. Make him your friend. Be perfectly open with him, and make him conversant with all the steps of the undertaking. Throw yourself with enthusiasm into his interests. Forget that you are working for a definite remuneration. If you are doubtful as to how to act on any occasion, imagine yourself to be your client for the time being, and, whatever befalls, it would be suicidal to quarrel with him. If first impressions are important, parting impression are still more so. Always part friends. You will avoid a difficulty if you explain to him very clearly the question of "quantities," the extra $1\frac{1}{2}$ or 2 per cent. will give him a shock at first; for, in all probability, he will be quite ignorant of the custom. Let him understand that you employ a surveyor as his agent; that if the contract is executed the contractor will pay the surveyor, but that if it is not executed it will devolve upon him to do so. Take care you do not entangle your client with the authorities or his neighbours. Look well to the question of street frontages and party-walls, and be very cautious with underpinning. If any bill for damage is presented, he will be very angry with someone, if only for the relief of his feelings, and that someone will be his architect. The question of "ancient lights" presents a peculiar difficulty in the light of a recent legal decision. The architect is placed on the horns of a dilemma. He may either advise adjoining owners of the extent of his building, and so bring various exacting claims upon his client, which would otherwise never have been preferred, or he may ignore the question of "ancient lights" and incur the risk of having to mutilate the building to accommodate them, when it is more or less complete, with the certainty of a good quarrel with his client, and the possibility of an action by the latter to recover damages. The best thing to do is to discuss the matter very fully with the client, and allow the responsibility to rest with him. In fact, one-half the pitfalls into which the architect stumbles arises from the want of a full discussion and a clear understanding. Mere verbal agreements are often worse than useless—the two disputants are sure to have different versions of the same interview. Have everything in black and white. Do not trust to the honour of your friend or client in a question of moment, for however honourable he may be, you are sure to quarrel with him in the end. No, endorse verbal agreements by a letter and keep a copy, and enter an account of the interview, or any important particular, into your diary. And a diary, by the way, should be an indispensable adjunct of every office. Letter-writing is either a virtue or a vice. It is a good servant and a bad master. When the writer is not known personally, his character is implied from his letter. Frequently letter-writing keeps an architect in touch with his surroundings, and a client is flattered by receiving a letter from time to time, and feels assured of his architect's interest in the work. But, remember, that, when posted, a letter is beyond recall, and—for good or evil—you are wedded to the opinions expressed in it. I try myself to get into the habit of regarding the possibility of every business letter being brought into a court of law. Clients are always in a hurry to commence work. Do not encourage it. Preliminary drawings are not to be dashed off against time, as you commit yourself by them to the broad lines of your design. Prettily-got-up sketch-drawings are a delusion and a snare. You are gratuitously preparing your client for disappointment. And, as for an estimate of cost, it is like an infernal-machine, and is not to be handled with light-hearted carelessness. Do not commit yourself to figures when you can help it; but, if you do, be sure your figures are correct. You may depend upon it you will be held to them afterwards. Do not court responsibility; it is a golden rule for an architect, and beware of lady clients. Precautions desirable with a client become imperative with a committee. It has been observed that committees and corporate bodies are sometimes capable of meanness and questionable transactions which each individual member would repudiate in private life. An architect must study men as well as materials, for he has to do with both. The committee meeting is a field for his tact, and it is often required. Meetings of educated business men are usually agreeable and methodical, but less educated men rush into windy talkativeness and open contention. Let the greengrocer have his talk out; it is his first opportunity of expressing his opinions to a wider circle than his own fireside. But do not descend to the fray. Do not commit yourself until the fight is over; and then, in the lull after the storm, your words will break upon the stillness with a clear and incisive authority. A committee usually consists of one who leads and the rest who follow, and it is the leader, of course, that the architect has chiefly to reckon with. At the same time, he must hold himself perfectly independent. Once let an architect sacrifice his independence, and pitfalls will yawn around him on all sides. Do not receive any instructions whatever from an individual member of a committee unless you have proof of his being officially authorised to give them; and especially remember that nothing but the corporate seal will bind a corporation. If you are acting for a body of men, you must manifestly be instructed by them as a whole: the majority may repudiate the opinions of the individual, and throw the responsibility on you for having listened to them. Do not work for charity. Bricks cost money, so must brains. Besides, man cannot appreciate what he does not pay for. Neither make your remuneration subject to approval, or to the correctness of your estimate of cost. You may find, to your dismay, that, although you have prepared three sets of drawings, or any number of sets, and have spent endless trouble, the mere "not approved" of your client will annul all claim for remuneration. But, as you have voluntarily submitted to the arrangement, you have only yourself to blame. To the architect who has started in practice with few friends and less capital there comes a pinch which tests his fibre. It is just then that he is tempted to work "for charity," and on approval, in the hopes of getting a connection, and there will never be wanting those who will take advantage of his embarrassment, Accepting trade discounts and less remuneration than the legitimate 5 per c compromises his independence, and will be a albatross round his neck for all his future ca With regard to the former, it seems to me b to have nothing to do with them, even if client fully understands their nature, and acc the benefit of them himself. But on this p opinions differ. As for building speculat touch not the unclean thing. Second- solicitors and impecunious builders are the combination for that. With regard to the w ing drawings, it is a mistake to make them showy or artistic. They are only a means t end, and the end is that the building sha worked out accurately from them. It is a mistake to show too much detail on the eig scale drawings. At the same time, they be thoroughly thought out and worked ou else the architect will find himself in the de grip of "extras." If a thing will not work satisfactorily on the drawings, it is a fallac suppose it will come right in execution; an less ambiguous the drawings are, and the they are left to the interpretation of the archi the less disputing there will be with the bui Do not accept the accuracy of plans or on the assurance of other people. Plot out site for yourself; and do not try conclu with the authorities. Sometimes one is tem to sacrifice convenience to design. It is a pi Beware in time. Either rearrange the par that the two do not clash, or else face the in able at once. If you do neither, some gh deformity will be arranged by your clie remedy the inconvenience. And who i blame? If you build your chimney so low it smokes, be prepared for the deformity cowl. Be sure of your construction. Yo responsible for it. It is, of course, false eco to stint the strength or stability of the cons tion for the sake of ornamental character. house-planning, a wise architect takes the l into his confidence. Their chief requiremen plenty of cupboard-room, well-lighted ste the cellar, and a kitchen on the ground floor. sure and have plenty of head-room for stairc On one of your visits of inspection the for will come up and say, "If you please, w only get 6ft. head-room for the back st we've tried it all manner of ways." And then the client walks up from behind and "What's the matter?" Single steps single winders are dangerous, and are gen signs of thoughtlessness. Warm the stai or the house will never be free from drau and if there is an unusually large surfa window in a sitting-room, such as a bay win the cold radiation of the glass will always duce draughts if no special arrangement of water pipes is introduced. Shut off the ki offices from the rest of the house, and well late them, or the smell of cooking will pe the house. If the journey from the kitchen dining-room is long or circuitous the dinne be cold. Place the bath-room over an portant room, so that if the bath overflow great amount of damage will be done, an precautions against water in the cellar. sider the position of the furniture in each room, and treat domestic servants as h beings, worthy of more comfort than a che garret affords. If an architect is to avoid e a clear, concise, and comprehensive specifi is an absolute necessity; and it seems to m the growing practice of intrusting it to a qu surveyor is very much to be deprecated architect has not thoroughly thought o building until he has written the specifi for it. And when he has done that with care, although not necessary with great el tion, he feels a sense of repose and confide the execution of the work, not to be at otherwise. In a specification vague ter expensive items. To suppose a builder will a better and more costly method of exec unless you specify it, is to be too flatter human nature; and to suppose that, even do specify it, he will execute it so unless y that it is done, is to show some ignorance builder-nature in particular. Of course, are exceptions to every rule. Do not try e ments of new materials and inventions others do that. If you do it, it will pr be at the cost of your client's pocket an own reputation. And, above all, allo contingencies. If a thing is absolutel fect, except under certain circumstances, circumstances are bound to arise. the working drawings and specificatio

nplete, let your client have both to look ough. Better to make a modification even at eleventh hour than that your client should be satisfied, or that the alteration should be de after the contract is signed. Obtain an ex-ssion of his approval if possible; it may help relieve you of responsibility. In connection h the actual building there are a hundred sibilities of oversight, which may lead to con-uences most disastrous to the architect's utation, but which a little care and attention letails might have avoided. Undoubtedly, the nitect's position is a difficult one. Many are operations in a building enterprise, and many the hands engaged upon it. Each is liable to or or neglect, and, however attentive the nitect may be, it is impossible for him to be ays inspecting the building. And so matters rror or neglect become covered up and ob-ed in his absence, even if they are not fully hidden from him. Yet it is he, and he ie, who must bear the responsibility before public. And the public will not stop to in-e into the difficulties of his position. "What he good of having an architect?" will be contemptuous question. And, although his ding is admittedly excellent in plan, design, execution, yet all the good that he has will not be remembered to him, if a chimney kes, or the water comes into the cellar. This be unjust, but it is a matter of experience. ehoves the architect, therefore, to pay minute ntion to the details of construction, arrange-t, ventilation, and the like, and to be very he is using good materials. If he has not good materials, time and weather will soon ose the fact to the public. A correct judge-t of materials can only come by experience, even the most experienced are sometimes at . It is, therefore, all the more necessary to e the question one of close study. It is a ortune that the education of an architect not comprise a study of the distinction be-n good and bad material. Might not a eum of common building materials, good and be a useful aid in the new educational me of this association? Do not condemn the rial unless you are sure of your judgment. ttle friendly consultation, in private, with a of experience will be very valuable. ough it is folly to allow bad material, it is ble to be hypercritical. An architect, like lfold justice, must hold the scales equal een builder and client. It is a good rule to ine the builder present in all your dealings the client, and *vice versâ*. Be sure of your lations. Test the ground yourself. If you to a soft part, have it cut out, and eted, or the brickwork carried down; step the brickwork from the higher wer level. See that the footings are in, ave a greater spread where greater weight o be carried. Beware of drawing off water the foundations in sandy soils. It will be ate to think of these matters when the s of unequal settlement have appeared. the same precautions with drains. Have tested in your presence. If they pass a building, arch the walls over them; if pass over new-made ground, carry them on ete or on brick foundations. See that these s are done, and do not take the builder's ance. Be sure that the damp-course is in, se that the brickwork is built solid round all s-flues in hollow walls. If smoke once finds ty into the hollow space, it will be impossible d the leakage, and endless annoyance to the may be the result. Examine every fire-to see that joists and purlins are not built the flues or too near them. Tie in wall-so that the roof will have no tendency to l. See that roof principals have sufficient ient, or efficient tie-rods. Take care that ason has not cut the beds of a column v in order to obtain a fine joint, or the will fracture. If you have to argue your-to the assurance that a beam is strong h, you may take it that your judgment it is not; therefore, make it stronger. the roof-tiles are being laid, take care ne mortar-bedding does not extend too far If it does, water will be conveyed gh the roof and drip on to the ceilings, ne client will write a letter to his architect nting him with the fact. The roof will to be stripped. I do not think there is ther remedy. Take great precaution in ing the interspaces between the rafters urch roofs, and allow a good air-space between the laths and tile-battens. Beware of internal gutters, and pockets where snow can accumulate. Carry chimneys well up, and give them some mass and breadth. The modern chimney is distinguished by its leanness. Guard against water soaking through brick sills, or driving under casements, or condensed moisture dropping from skylights. See that water-pipes are not exposed to frost, and do not trust anyone but a thoroughly competent man to fix the kitchen cylinder: otherwise you will get into hot-water. Keep the gas-meter away from any source of heat, or the water will distil into the pipes, and there will not be a steady gas-flame in the house. Do not lay a wood-block floor until the concrete bed is quite dry, or the wood will swell and the floor "rise." And, above all things, beware of dry-rot. For a man who has spent a considerable sum in building a house to have to spend another £50 on new floors and skirtings before he can inhabit it, will prove a great strain on his composure; and it would be an even greater trial to a committee, which had collected its scanty funds with the greatest difficulty, to see them swallowed up by this seven-headed hydra without a murmur against the architect. Do not trust to caretakers: they are not to be supposed to have any intelligence. They will stop up the ventilation openings if they can, or else allow them to get choked with dirt. For the sake of your own reputation, urge your client or committee to have a periodic examination of all such air-inlets, and of the under floor-space. The latter can be arranged by having movable floor-boards screwed down. You might also take similar precautions with regard to running the water out of heating coils on frosty nights, and also with regard to domestic servants letting soap, hair, and the like get into sink waste-pipes. I now come to what is, perhaps, the most frequent and insidious pitfall of all, the accumulation of "extras." It is almost impossible to avoid extras, to some extent; but there is a reasonable limit beyond which they must not pass. Contingencies often arise which it is impossible for an architect to foresee, and no reasonable client would object to extras for such, even though he did not like them. When, however, an architect, in order to improve his design, incurs a heavy extra for a modification in the plans which his client has approved, he incurs a serious responsibility, and he may find that he has to refund the cost of his indiscretion. It is the wisest course to keep your client fully aware of the extras as they arise, and to obtain his sanction first to all those that are not quite trivial. If possible, obtain an estimate of extra work beforehand, and submit it to your client for approval; and insert a clause in the contract that all extra work is to be valued at the same rate as that on which the tender is based. It is certainly most unreasonable to spring a considerable extra expense upon a client, incurred by his architect without his knowledge. In order to avoid any difficulty whatever, make the payment of extra work contingent, by the terms of the contract, on the architect's written order, and insist upon this procedure. At the same time, advise your client that he has no power to give any orders except through your agency. It will avoid disputes if you afford both parties to the contract the opportunity to fully study its contents. I have been surprised to find it necessary to ask builders to read through an agreement before signing it. For the architect himself, it is most important that he should be under no obligation whatever to either parties of a contract. He must not only be impartial, but give no occasion to the suspicion of partiality; keep strictly to the terms of the contract, and avoid the law like poison. I will not notice the questions of dilapidation and valuation further than to point out the caution required in dealing with them. If the public is induced to invest its money in any enterprise on the strength of your valuation, and this should turn out to be altogether too visionary, you will have incurred a heavy responsibility. If you are doubtful on the subject, it is better to pay for good advice. There is danger in trying to be a universal specialist. Find good brains, use them, and trust them. Before concluding, there is one more question to consider: That of giving certificates. Always keep good security, and keep well in view the contingency of the builder's failing before completing the contract. If you do not, you will have involved your client in embarrassment. Be very cautious in giving the final certificate. It is the client's acknowledgement, through your agency, that the builder has completed his part of the contract, and it debars him from any further claim. Pitfalls will come as long as it is human to err; but if an architect refrains from compromising his independence, pays attention to details, and never trusts to a verbal or ambiguous agreement, and will not allow himself to be persuaded against his judgment, he will avoid very many of them. It is easy to be wise after an event: to be wise before it is to learn from the experience of others.

A short discussion followed the reading of the paper, in which Messrs. H. O. Cresswell, E. Woodthorpe, Arnold B. Mitchell, F. T. W. Goldsmith, Leonard Stokes (ex-president), A. J. Bolton, C. H. Brodie, and the President took part, and a hearty vote of thanks was accorded to Mr. Bidlake.

THE SOCIETY OF ARCHITECTS.

THE first ordinary meeting of the Society of Architects for the session will be held at St. James's Hall, Piccadilly, on Wednesday afternoon next at 3 o'clock, when the President, Mr. W. H. Seth-Smith, F.S.I., will deliver the opening address of the session. This will be followed by a discussion, members only being allowed to be present, upon matters of interest to provincial members, amongst these being: The organisation of the provinces in support of the Architects' Registration Bill; the formation of a lending library, open to provincial members; the holding of sessional meetings in provincial centres; and the advisability of increasing entrance fee in future. The list of members shows a total of 428 on the roll, there being now 11 honorary members against 4 at the close of last session, 408 members against 396 last session, and 9 associates against 10. The report of the council states that during the session a policy of improving the organisation and extending the influence and giving stability to the Society has been steadily persevered in. Local secretaries, who had previously been appointed in only two provincial centres, have been nominated for all the principal cities and districts of the country, and for several of the colonies. The council have advised the Society to seek incorporation, and with this view they caused a memorandum and articles of association to be drafted, the former setting forth more completely than has hitherto been attempted the objects for which the Society has been founded and reserving powers for their accomplishment, while the latter comprise the present rules, with many alterations and additions, such as experience and the growth of the Society show to be necessary. These were submitted to the members at the annual general meeting in June, and, with certain amendments, adopted, it being left to the council for 1891-2 to carry out the reforms thus inaugurated. During the session papers were read by the President (Mr. R. Walker, of Cork), and by Messrs. G. A. T. Middleton (secretary), A. W. Rimington, T. C. Fidler, W. H. Seth-Smith, G. Howe, W. Woodward, C. E. Gritton, W. Aumonier, and Henry Adams. Mr. C. H. Searle, one of the oldest members, having resigned the office of treasurer, Mr. E. Tidman, F.S.I., was appointed in his stead. Arrangements have been made for obtaining a new lease of the premises now occupied at St. James's Hall. The financial statement shows a balance in hand of £49 10s. 7d., being £10 more than that announced last year. The council again express their regret that the Architects' Registration Bill should not have reached its second reading yet, but congratulate the independent committee which has the matter in hand upon its having reached a stage when success is more reasonably to be hoped for than heretofore.

THE FIRE AT SANDRINGHAM.

THIS fire, which, but for the rapid and workmanlike way in which the private fire brigade of His Royal Highness the Prince of Wales, under General Sir Dighton Probyn, V.C., and Mr. Mann, the captain of the brigade, might have ended in the total destruction of the house, shows clearly how desirable it is that the principles of fireproof, or rather fire-resisting, construction should be adopted in all country houses. It would seem that a portion of the floors of Sandringham were constructed of iron and concrete, while the partitions were of the usual

description of wood studwork; the roof and upper floor, which were of timber, were entirely burnt out, and the fire practically limited on the second floor to the destruction of the central block of rooms, the further progress of the fire being in part stopped by the concrete floors, and in the roof by iron trap-doors inserted in the various division walls carried up to the roof-line, some of which were much buckled by the heat, but, nevertheless, materially helped to stay the further progress of the fire. Had the partitions been of brick, or other fire-resisting material, it is probable that considerably less damage would have been done. The supply of water was fortunately almost unlimited, and the hydrants, both back and front, were brought into active play within a very short time of the alarm being given. Considerable damage has necessarily been done by water, but thanks to the partial fire-resisting construction of the house, the provision of sufficient hydrants with high-pressure service from the large water tower in the grounds, the tank of which held over 30,000 gallons of water, kept filled by constant pumping, the total destruction of the building was prevented.

Now that architects have learned by the recent long and costly strike of the carpenters and joiners that there are other means of constructing floors and roofs (at little or no extra cost) than with timber, it is to be hoped that fire-resisting construction will be much more extensively used in all country as well as town houses. Light iron or steel joists bedded in concrete, with wood blocks bedded therein for fixing the necessary flooring, would save many a lonely country house from destruction, for it is not in every place that the water supply or service can be as good as it was at Sandringham. At small additional cost the roofs may also be constructed of iron or steel rafters bedded in concrete, as is now being done in the new club house in Piccadilly for the Junior Constitutional Club, under Mr. Edis, the architect, and fire risk thus practically reduced to a minimum, if all partition walls are carried up in brick or concrete to the underside of roof slope.

His Royal Highness the Prince of Wales has intrusted the work of restoration to Mr. Robert W. Edis, F.S.A., architect, of London, who designed the new ball-room, and under whose directions a temporary roof is being put over the burnt-out block to protect the building until the permanent reconstruction can be carried out.

NOTES FROM EDINBURGH.

THE Dean of Guild, on occasion of his re-election, lately gave some statistics as to the building operations carried on during the course of the civic year about to close, or, rather, already closed. There has been no falling off, nor yet any perceptible increase, as compared with the statistics of the year preceding—442 warrants for 1891 compared with 441 for 1890, and 548 for 1889. Of these operations, the greater portion always comprises numerous alterations merely. The increasing number of dwelling-houses continues to be at the same ratio, and these, since the passing of the Police Act of last year, are much more carefully supervised than before; the conditions for granting warrant of erection being more stringent in many ways, but all with a view to the better sanitation of all future extension of the city. The tendency to build too high has been checked by the provision that every new street must be 40ft. wide (20ft. being the minimum hitherto), and no house higher than one and a quarter of the width. A certain amount of back green space is also required, a very necessary provision where the tendency is to make the most in every way of the area at command. The Court has also now the power to forbid any insanitary sub-division of tenements, where it is proposed to increase the number of tenants. Relief is also given by the Act, in the case of any warrant for minor alterations, whereby the Dean of Guild may, if satisfied, give his sanction without the usual formalities and consequent expense.

In respect of the extension of the city, a new scheme has just been started, with the object of making the Barnton Estate, lying about three miles from Edinburgh, a residential suburb. The Waverley suburban line, on the south side, has had so great success in developing that suburban district, it is not wonderful that the Caledonian should be found proposing to make a line expressly with the view of accommodating the public, even when seeking a suburban residence so far afield. This new line commences with a junction to the Leith suburban line about Craigleith, and will be 2¾ miles in length, with its terminus at Crammond Bridge, and another station at the east end of the Barnton Estate, the cost estimated to be £35,000. The rate for the perpetual building lease will be low—about £10 per acre. The mansion house of Barnton, with considerable acreage around it, will be preserved to preside over the rising suburb. About 4,000 villas of all sizes are indicated on plans, so that, if any success attends the scheme, some considerable check may be given to the extension of the city westwards. Arrangements are made for all the usual and necessary equipment of an independent town, gasworks, &c.

The McEwan Hall is now at an interesting stage of its progress to completion, the mason work of the main fabric being all but finished, and the contractor busy with the erection of the iron roof, which has been in progress for many weeks, and seems to make slow advances. This, however, is not so, the ribs of the dome being of such size, and weighing each about five tons, the task of merely shifting lofty scaffolding taking itself a great amount of time and labour in such contracted space. Already the great eye of the dome, 24ft. in diameter, and about half of the ribs have been placed. The dome is a flat one, with a rise of about 30ft. in one-third of the diameter, and promises to be a conspicuous feature in the distance. It will be slightly truncated at junction with the buildings already completed.

The plan of the auditorium is a semicircle of 100ft. diameter, carried on with straight lines to junction with the main edifice for a short space, and with a recess in line of the college building, 67ft. wide and 25ft. deep, for the platform of the hall. The height from floor to the cornice, immediately below the dome, is 60ft., and from that to the cupola 20ft., or about 90ft. in all. It is not easy, however, to form any very good idea of the interior proportions without the floor. An excellent model of the hall, with minutely accurate detail, explains everything to the eye—both outside and inside—the latter as seen from the platform, and an ingenious arrangement of gas-light indicates the effect of the cupola in lighting up the interior.

The interior, however, is much larger than the dimensions given above would indicate, as two tiers of galleries are provided for outside it, over the corridor passage, which surmounts the circular wall of the auditorium, and which will be about 15ft. in width. This allows of five stages, some of which are being erected in the upper tier. These are carried on steel girders, resting on corbels, wrought on the lofty columns of the hall. The frieze of the entablature is finished with the sculpture, and shows Rennaisance floral design, with which the City or College arms are intertwined. Over the capitals of the pillars at sides the M'Ewan arms have a place of honour.

The interior will be thoroughly lighted to its farthest recesses—no doubt by the roof light. There will also be the range of circular clerestory lights immediately under the dome, and large lunette or segmental lights where the west wall rises above the older building.

The grand staircase entrance on the south is now well on towards completion. It is about 30ft. in width, circular for the stairs, with landings on the south side, carried on pillars of red sandstone and arches. All the interior is of polished stone-work; the steps of hard Arbroath stone. The balustrade and all details are of the most tasteful and ornate description, and the plain outline of the balusters is relieved and enriched by sculptured foliage meandering over the surface. The ascent is very easy, the steps being low, and the same commodious design marks the circular gallery staircases, which are about 6ft. wide, built round a circular pier of brickwork about 4ft. in diameter.

The ceilings of the great staircase will be groined, the groinings resting on finely-carved corbels. All ceilings are groined, either with concrete alone, or stone groins and quadripartite vaulting in brick. The walls of corridor surrounding the auditorium and ceilings are of a fine faced brick of a pure bright-red colour, the stone groin being in plain angular chiselled work.

The whole of the basement wall surface is lined with white glazed brick. The completion of the tower is still unprovided for.

Another large undertaking is making g progress — viz., the Caledonian-road Stat which will by-and-by be a crystal palace tow ing above the western portion of the city. mason work of the Princes-street frontage only partially begun in the portion of s available without detriment to the passer traffic; but is well advanced, and a little al the foundations along the Lothian-road. whole of this, the architectural part of the des is a mere verandah for the shed behind; is being built in a manner most substanti strong enough to carry any superstructure the shape of an hotel.

The walls of the great shed are completed nearly so. They are very lofty, as seen f the lane on the north, and buttressed with stantial piers, and have a base course, corr and a blocking course. The whole of the m work is carried out in red Dumfriesshire ston

The ironwork of roof is being erected Messrs. Fowler, of Motherwell, in steel. width between walls is 180ft., and the desig the roofing simple, light, and lofty. If pr means of ventilation are provided there shoul less of the dirty discoloration that marks Waverley shed, and there is certainly a n more sightly and less perplexing arrangemer materials. The main girders, about 60ft. a probably, are 20ft. deep, of the most sin zigzag pattern. They are stiffened longit nally by three lattice girders, with segme intrados, and at the outside, under the trusses, by a light screen girder. The trusses, running north and south, are of usual character. The most striking featu the whole is the seemingly small amount of i work employed to bridge so large a span.

The Royal Scottish Academy opens this y instead of waiting till February. This is a arrangement, as the winter months will pre better opportunities than the spring, with greater attractions in the way of out recreations.

CHIPS.

The memorial stones of a new Wesleyan Me dist church were laid on Wednesday week a village of Thorpe, near Whitby. The new ch is to be built of stone, and the site is in the ce of the village, which is growing in importance sea-side watering-place. Messrs. Waddington Manchester, are the architects.

Mr. J. Herbert Lewis, chairman of the Flint county council, has built and presented t neighbourhood of Ffynnongroew (a scattered l let adjoining Mostyn) a school for infants. building, which has been erected by Mr. Mat Rogers, Flint, from the design of Mr. Ri Owens, architect, Liverpool, will accommod scholars.

The French Chamber has adopted the Bil the construction of a museum of decorative a the site of the former Cour des Comptes, d'Orsay.

The Anglesea county council have decided to i plans by competition for a police station at H head, premiums of £50 and £10 being offere the two best plans.

At a meeting of the members of the joint mittees for the supply of water to Colwyn Conway, and the district, held on Friday at way, the tender of Mr. T. Bugbird, Carn (£21,500), was accepted out of a large numbe in. Mr. Farrington, C.E., borough survey Conway, is the engineer in charge of the sc the supply of water being drawn from a lake mountains near Llanrwst.

The Hunt memorial museum at Redruth opened on Monday week. It cost £700, exc of furniture, and is 30ft. by 40ft., and 20 height. The contractors were Mr. Gray, of ruth, and Mr. Moyle, of Chasewater.

Sanitary engineering must, "Atlas" rema the *World*, certainly rank high among the professions of the future. Mr. Cousins, who go out during the winter to report on the M drainage question, will receive something £3,500 for his six months' work.

The opening address of the present session Society of Arts will be delivered on Wedn week, the 18th inst., by the Attorney-Ge M.P. The Wednesday lectures for the s include one on "Typological Museums," by G Pitt-Rivers, and another on "Artistic Treatm Jewelry and Personal Ornament," by Mr. Toules, of Birmingham. A course of three lectures on "The Pigments and Vehicles Old Masters" will be delivered by Mr. Laurie on Nov. 30 and Dec. 7 and 14.

WAYSIDE NOTES.

CONTRARY to the admonitions of Mr. Ruskin, the majority of our greater lights seem prone to reside more or less centrally in the heart of London, when, one would imagine, having sufficient leisure and superfluous funds, they would prefer residence in some more rural district, and thus escape the danger of that "walling-up of the imagination" which the author of the "Seven Lamps" avers to result from the habitual contemplation of bricks and mortar. The architect might naturally be supposed to be a lover of rural scenes, and to relish for an environment of beautiful country and continual converse with Nature in her every mood, desiring nothing more fervently than his own country seat, howsoever modest, wherein he might daily meditate "all in a garden fair." But supposing the dwellers in town to possess anything more extensive than such back-yards as municipal by-laws enforce for the sake of light and air, they have at best to make do with a London garden—that pitiable substitute for its country relative—which, with its smoke-blackened tree-trunks, blighted foliage, and sickly grass, always appears to me the very essence of mournfulness.

These things being so, then, it is pleasant to take up the posthumous work of Mr. J. D. Sedding. "Garden Craft" should atone in some measure for the general neglect by architects of the study of those common objects of countryside which, for all their commonplaceness, contain lessons for all time such as we need to take to heart in days of machine work, and feeble dependence upon ancient examples. Mr. Sedding resided sufficiently far away from the Metropolis to personally put into practice those principles of "garden craft" he has advocated in his work, and he looked to it that, for his part, there should be no "walling-up" of the imagination by residence among bricks and mortar. It would be well if there were many more after the mind of the late architect. Too large a proportion of London architects cling to town life like the cat to the hearthrug. Seeing how largely the elementary principles of design—more especially decorative design—are derivable solely from constant study and observation of nature, this continual citizen life must influence the class of work of London architects. By "nature" I would not mean such a narrow interpretation of the term as is represented by London gardens and fashionable conservatories, but the whole face of heaven and earth, the sea and all that in them is. In the curling wave, as in the shell by the seashore; in the rolling down, and in the grass that grows on the hillside; and in the leafy oak-tree, as in the delicate ivy shoots that cling to its rugged bole, there is inspiration for all who have eyes to see, hearts to feel, and knowledge to understand.

Sandringham House was neither noteworthy architecturally nor historically; but all will regret the personal loss and inconvenience to the Prince of Wales, who was about to make more than ordinary use of his Norfolk home. According to general supposition, the fire originated from a defective flue—showing how the prince and the peer are both in common danger of the great curse of fires in country houses, and demonstrating, furthermore, how much careless workmen or others have to answer for. There is an up-to-time air about the announcement that on the discovery of the fire on Sunday, "the various district church-bells clashed the alarm."

As ordinarily happens when a large country mansion gets well alight, great damage has resulted from the fire. Unlike a fire in town, where, within a few minutes of the announcement that Mrs. Jones's curtains are blazing in the "first-floor back," steam fire-engines galore come dashing up from all sides, endangering, in their hurry, the lives of citizens innumerable on the off-chance of having to save someone or something, we have a very different scene at the country fire, especially the fire at a large mansion. Means of fire-extinction sufficient to cope with the burning cottage of ordinary house, and a band of firemen, whose most experience may have been attendance on a fire at Mr. Wurzle's stack-yard—on which occasion they made a thorough job of the thing by pumping so much water on stacks as to actually spoil all that the fire had spared—are useless against the mass of fire in an extensive mansion. And as to that prevention which is better than cure, the hand fire-extinguishers will prove rather aggravating than otherwise to anything like a determined outbreak, and the family being out of town, such boy domestics as are on the premises may have borrowed the nozzles of the standpipes—"if any," as Wightwick has it—for the purposes of practising melodies of the hunting-horn. All things considered, therefore, we need scarcely wonder at the wholesale destruction that follows a fire at a country mansion. Means, provided at great expense by the proprietor, for fire-extinguishing are ineffectually worked, out of order, or otherwise rendered useless on emergencies; and though all the country around may be astir, there is no checking the progress of the flames without means proportionate to the end to be attained. In most cases, it will only be a manual engine that will arrive, and what one or two "manuals" are when opposed to a large fire we do not require very extensive experience to determine.

I trust that the contractor for the proposed Blackwall Tunnel will make a better thing of the contract than have the contractors for the execution of works in connection with the tunnel under the Mersey at Fidler's Ferry, who, it has been stated at a meeting of the Liverpool Town Council, have dropped some £16,000 or £17,000 on their contract. It is now proposed to release the contractors from their engagement, and to make a new arrangement with others to continue the works. That contractors should be so unfortunate as to lose money on a contract to such an extent as in this instance, is less surprising when we consider the nature of the work. Tunnelling for ordinary railroad purposes through hill and mountain is hazardous enough, and the work becomes infinitely more so when the tunnel is formed under water with all the risks of unforeseen inundations and other unlooked-for mishaps. Much, however, seems to have been done in perfecting the pneumatic-shield system of working, so that risks from inundations are now vastly reduced; but the work remains yet subject to special risks. Contractors will only take it up under terms allowing a much larger margin for contingencies than in other classes of work, as witness of the truth of which we may take the tendering for the Blackwall Tunnel. The highest price allowed, apparently, an enormous margin, whilst even the lowest, which the County Council on Tuesday last, by a majority of 41 to 10 votes, have decided to accept, is far in excess of the Parliamentary estimate.

A.A. Notes for November to hand. The number will be found interesting in parts, and contains, as supplement, the Presidential address printed *in extenso*. Bright "Notes," an account of a visit to Amsterdam, a description of an experience in pupilage in a provincial office—in which I am glad to see a word said against those who supply builders with slovenly plans—are in the number, while the stock dish of Street's lectures comes up again, the present instance being a protest against unreasonable symmetry, which protest, I am glad to think, we do not much require at this day, having made some progress since the days of the Classic revival and its stiff formalities of plan. The word as to the supplying of roughly-made plans to builders is timely. On occasions it may be that pressure of work causes the drawings or tracings to be sent off hurriedly and with draughtsmanship not of the first order; but those architects who habitually supply their builders with indifferently-prepared drawings on the plea that "anything will do" for such purposes, must have little of the true spirit of the architect in their nature. I should, indeed, go so far as to say that if builders in receipt of ill-made plans did their work in an indifferent manner, that in some small measure the architect would be to blame for the example set. It is but a natural effect that a man having put before him a piece of badly-done work, should imagine that the most perfect workmanship on his part was also unnecessary. No architect having pride and interest in his work—and all true architects must take pride and pleasure in all they do—would be guilty of putting before the builder an inferior set of drawings just because it is the builder who is concerned, and not the client. It is true that the drawings are merely a medium, as the MS. is a medium in printing; but the medium affects the actual produced work, especially in the matter of the details of its accomplishment. And putting aside all practical disadvantages of ill-made drawings, it shows kindly consideration for our builders if a little courtesy is evidenced in the preparation of the plans they have for their guidance on the works.

When a Welshman is emphatic it is with a vengeance. The Churchmen of the diocese of St. David's have been taking holy counsel together in diocesan conference, and among the other spiritual offenders we architects have duly come in for our share of thunder. Mr. Davies, of Compton, Aberayon, says, "the greatest curse of church restoration is the local architect." A hard saying—is it not?—for us who know the thorns in the flesh in the shape of the æsthetic parson with a taste for fancy ritual, and the she-dragon who usually dominates him? We are not, however, denounced alone. The next sinner is the Incorporated Church Building Society, which will not stump up in accordance with the large-hearted restorers of St. David's. What the Welshmen apparently want is a society that will find all the cash and an architect that will do the work for nothing. GOTH.

CHIPS.

A memorial cross, erected by public subscription, over the grave of the late Dr. W. H. Monk, the musical editor of "Hymns Ancient and Modern," was uncovered in Highgate Cemetery, on Monday, by Bishop Jenner. The monument, which is of massive Aberdeen granite, was designed by Mr. James Brooks. At its summit is a cross, and at the base a suitable inscription.

Mr. W. Booth-Scott, M.Inst.C.E., for over 35 years chief surveyor and engineer to the vestry of St. Pancras, died suddenly on Saturday morning, at his residence at Church-row, Hampstead. He was in his 70th year. The appointment is worth £650 per annum.

Lady Frederick Cavendish opened, in the Leeds Fine Art Gallery, on Monday, an Exhibition of Arts and Crafts, held under the auspices of the Yorkshire Ladies' Council of Education.

The Common Council of the City of London have resolved to unite with the County Council in promoting a Bill in Parliament next session dealing with the water supply of the Metropolis.

On Saturday the memorial stone of the first block of cottage homes being erected at Colinton by the Aged Christian Friend Society of Scotland was laid. The block, consisting of eight houses, is being built in Redford-road, near the village, and each house contains a room, a light closet, and a scullery. Mr. Wilson, of Edinburgh, is the architect, and estimates have been accepted involving an expenditure of £1,380.

A stained-glass window has been put into the south aisle of Jedburgh Parish Church, to the memory of the late Mr. James Stevenson, for many years Procurator-Fiscal for Roxburghshire. The window was the workmanship of Mr. Ballantine, Edinburgh.

An adjudication in bankruptcy is gazetted in the case of Thomas Porter, of Lowestoft and Carlton Colville, architect.

A bust of Matthew Arnold, executed by Mr. A. Bruce Joy, was unveiled on Saturday, in Westminster Abbey. The memorial, which is of Carrara marble, is placed in the baptistery, near the west entrance, between the busts of Kingsley and F. D. Maurice. The medallion to Mr. Henry Fawcett is below the window, and nearly opposite is the statue of Wordsworth. On the west wall is the memorial of Keble.

The interior of the church of St. Agnes, Southport, has been decorated in colour. In the spandrels over the nave arcades are represented the four major prophets and the four evangelists, designed by Mr. Shields, and executed by Mr. Britten, both of London.

A new post-office at Northwich was opened on Monday. Messrs. Stelfox and Carter, of Northwich, were the builders, the sub-contractor for the stonework being Mr. G. Rathbone, who also acted as clerk of works. Mr. W. H. Chadwick has done the painting, plumbing, and gas-fitting.

Mr. Geo. Anderson, builder, Rochester-terrace, Edinburgh, who was severely injured on the 28th ult. by the fall of a stone while he was superintending some work at the Convalescent Home, Corstorphine, died yesterday morning in the Royal Infirmary at Edinburgh, to which he was conveyed after the accident.

New schools are in course of erection for the Guildford school board at Charlotteville. Mr. G.W. Lowe is the architect, and Messrs. Morgan, Isted, and Morgan, of Southampton, are the builders.

Our Illustrations.

THE WARRIOR MEMORIAL AT THORN.

This rich work in glazed brickwork, executed in reds, greens, and browns, has been erected from the designs of Professor Otzen, the celebrated German architect, whose works are conspicuous among the more important buildings of Berlin and the neighbourhood. His Church of the Holy Cross in that city cost over £30,000; and the Lutheran Church there, which he built, cost £24,000. The leading characteristic of all the professor's work is that faïence and glazed wares are largely introduced. The moulded brick buildings of the North of Germany, dating from the Middle Ages, afford fine models for study, and furnish one of the great types of Mediæval Gothic architecture in a specially local style, to be found in Europe, just as other types are seen in North Italy and in Spain. The Mediæval brickwork of Pomerania, too, has been more than once illustrated in our pages by Mr. J. Tavenor Perry. Prof. Otzen has, on thoroughly modern lines, developed for new uses this style of constructive ornamentation, and so numerous are the examples of his buildings in this style that Herr Wasmuth, of Markgrafenstrasse, Berlin, has lately issued a monograph fully illustrating most of the more important of them as a textbook for those who study new work as well as old in acquiring a knowledge of architecture. The Warrior Memorial at Thorn, shown to-day from the architect's own perspective view, which he has lent us, is, as we have said, entirely in brick. Stone has always been a luxury in North Germany, and the architecture of the districts in the quarter of Saxon Switzerland and the Hartz Mountains, naturally developed out of the material readiest to hand. Stone, indeed, had to be shipped from Sweden, and thus brick was, and is, the material most available. This present florid work is further elaborated with Venetian mosaic for the Coats of Arms and inscriptions.

PLOUGH ROAD BOARD SCHOOL, CLAPHAM JUNCTION.

This school has been recently erected for the School Board for London, from the designs of their architect, Mr. Thos. J. Bailey. The building accommodates 1,200 children, in three departments, for boys, girls, and infants, with six classrooms, and a central hall, about 70ft. by 30ft., for each department, and contains the usual accessories of ample cloak-room accommodation, teachers' rooms for each department, lavatories, &c. There are good open and covered playgrounds, with caretaker's house and centre for instruction in cookery. The staircases are faced with glazed bricks, as also the dadoes of classrooms and halls, which are plastered above. The exterior is built in the ordinary grey stocks, with red edgings and stone gables, the roofs being of Broseley tiles. The cost of the school, with works to playground, and all accessories, has been £16,250 11s. 4d., the builder being Mr. Chas. Cox, of Hackney. The drawing from which our illustration is reproduced was exhibited in this year's exhibition of the Royal Academy.

HOUSE FOR PROFESSOR WILLIAMSON, F.R.S.

This house was built near Hind Head, of red brick, the walls of the upper floors being covered with hanging tiles, as the situation is an exposed one. The roof is covered with Broseley tiles. The contractors for the work were Messrs. Grover and Sons, of London. Mr. Frederick W. Waller, of Gloucester, was the architect.

"APOLLO PLAYING TO THE SHEPHERDS": PREMIER GRAND PRIX DE ROME, 1891.

This work of sculpture, by M. François Sicard, of Paris, won the Grand Prix de Rome this year in a strongly-contested competition. His design is marked by a freedom of treatment and grace of line, which well befits the panel for architectural purposes, without too rigidly subordinating the figures to their immediate surroundings, so long considered an essential limitation to a legitimate use of sculpture in buildings.

THE TURKISH BATH, DRAWING-ROOM, AND LIBRARY, HOTEL METROPOLE, BRIGHTON.

Mr. Alfred Waterhouse, R.A., has popularised more than one style of work in finishing and furnishing the interior of his monster hotel at Brighton, as the four photographic views which we publish to-day amply demonstrate. The Turkish Bath, rich in faïence and brickwork, is thoroughly suggestive of its intended purpose, and without slavishly following the more conspicuous forms of Moorish design, the architect has secured an air of spaciousness, brilliancy of colour, and Oriental splendour which baths of so luxurious a kind seem to suggest. The Drawing-room has large paintings of notable Sussex mansions, fitted in panels round the apartment, as shown in the view, between a dado in white and a deep plaster frieze. The Library Chimney-piece in walnut, like the bookcases, needs but little description, as the photograph shows the work clearly enough as being well adapted for its club-like character. We printed a general view of the Hotel Métropole at Brighton in the Building News for May 10, 1889, from Mr. Waterhouse's Royal Academy drawing that year.

TATE CENTRAL LIBRARY, BRIXTON.

For description and further sketch, see p. 666.

TYPES OF CHAIRS, OLD AND MODERN.

The ancient chair which figures first on this sheet is supposed to be Etruscan. Executed in marble, it is carved in low reliefs representing a procession of warriors, a boar hunt, &c. It is now in the Corsini Palace at Rome. Unsuitable from its weight for anything but a state chair, still it is an object of great beauty; and, from the fact that it must be one of the oldest chairs extant, obtains a prominent place on our page. The well-framed chair next to it, with a pronounced Roman character, is a good type. Somewhat uncommon features are the perfectly straight arms and the arch and baluster work under the seat. It has an official appearance, and would look well at the head of a table in a committee or board room. The "Georgian" is the antithesis to the formality of the last. The curved arms, bent supports, and widely-spread legs give it a jaunty air, which suggests familiar conversation and the comforts of a glowing hearth. It was to be seen at the recent Naval Exhibition. The design emanating from the "School of Handicraft" is as simple as it is effective. The seat is covered with tan brown leather, and a broad piece of the same material, embossed and well padded, makes a suitable finish to the formal back. The two first chairs below from good furniture for a hall. The "Shakespearean" is a form familiar to us as being the product of the period to which our great national poet belonged. The high-back seat, next in order, belonged to Thomas Wentworth, first Earl of Strafford, and has his arms carven thereon. It forms one of a set now preserved at South Kensington Museum. These two are perhaps not what would be called comfortable chairs according to present tastes but then they were adapted for use in times n given to the luxury of the present age—in a age, too, when life was passed more in the ope air, and had little desire for that ease which no leads to many padded monstrosities. The latter bulge out into ever-varying forms, fashion and a craze for novelty dictate. The is little doubt that if the old furniture designe were required to work for the present day, th would, without sacrificing the greater ease no demanded, give us something beautiful at t same time. The "King Charles," though modern make, is a noticeable exception to o last remark, for it is as comfortable as it dignified, being firmly made, well stuffed, a covered, moreover, with sumptuous Genoa velv with a stamped pattern. Space will not perm us to do more than call attention to t interesting chair from the studio of Mr. J. Reid, the talented painter; and the quaint a feelingly designed "Queen Anne," whi possesses a charm all its own.

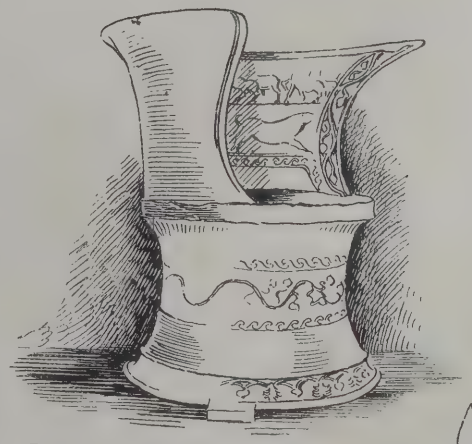
COMPETITIONS.

Aberdare Conservative Club.—The desi prepared by Mr. James Crombie, A.R.I.B. Brixton, for a new Conservative Club at Ab dare, South Wales, has been placed first, and has been instructed to carry out the work.

Bath.—The Municipal Buildings Competit has not attracted so many designs as might h been expected, but out of the nineteen sets designs which have been received, no doubt fr what we have seen some will prove worthy of occasion. Part of the present well-known fac will be incorporated in the intended group, which the existing pediment is to form central feature. Mr. William Young, F.R.I.B. of Lancaster-place, is the professional refe The drawings were received at Bath Saturday.

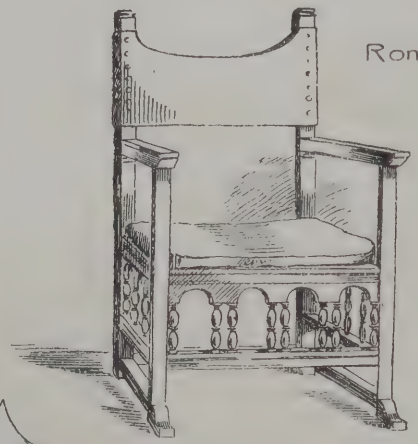
Birmingham Hospital.—The conditions competition and particulars of accommodat together with block plan of the new site, for General Hospital were forwarded on Fri evening to the competing architects. F months is allowed to send in designs.

Coventry.—It will be remembered tha month since the city council of Cover accepted plans for new baths to be erected in Pool Meadow submitted under motto in comp tion, which proved, when the envelopes w opened, to be the work of a "minor," Harold T. Burgess, a pupil with Messrs. Spal and Cross. The council have now decide appoint the principals of that firm as jo architects with Mr. Burgess for the work.



Oxford. — Last Saturday the competi drawings for the Oxford Municipal Build were received. Owing to the illness of Mr. E Bruton, F.R.I.B.A., of Oxford, who was pointed as professional referee, it has b decided that the duties of assessor shall be ca out by Mr. T. E. Collcutt, F.R.I.B.A. London.

Port Talbot Intermediate School Co tition.—We are informed that, owing to dissatisfaction expressed in this competitio the non-appointment of a professional assesso the committee as promised, the whole of plans were returned, and the committee, wit assistance of Mr. E. M. Bruce Vaug F.R.I.B.A., have reconsidered the plans, the result that those of Mr. T. P. Martin Messrs. Phillips and Holdgate were sele The committee have appointed Mr. Mart carry out the work, subject to the approv his plans by the County Council and the Ch Commissioners.



The Prince of Wales attended at St. Ba lomew's Hospital yesterday (Thursday) after for the purpose of receiving, as president o hospital, the portrait of Sir Sydney H. Wate the treasurer, which has been painted by Prof Herkomer, R.A.

The mayor of Newcastle-on-Tyne opene Friday, a new swimming-bath at Newcastle w house, in a building adjoining the main blo property. The bath is 50ft. by 21ft., wi average depth of 3ft. 6in., and was construct a cost of £600. The plans were prepared b W. H. Dunn, the architect, and Messrs. G Scott and Son were the contractors.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE opening meeting of the session of the Institute was held on Monday evening. The meeting-room at the Institute's premises in Conduit-street had been renovated during the recess, and the electric lighting improved and rearranged. The President, Mr. J. MacVicar Anderson, occupied the chair. Several ladies were among the visitors present.

THE OPENING ADDRESS

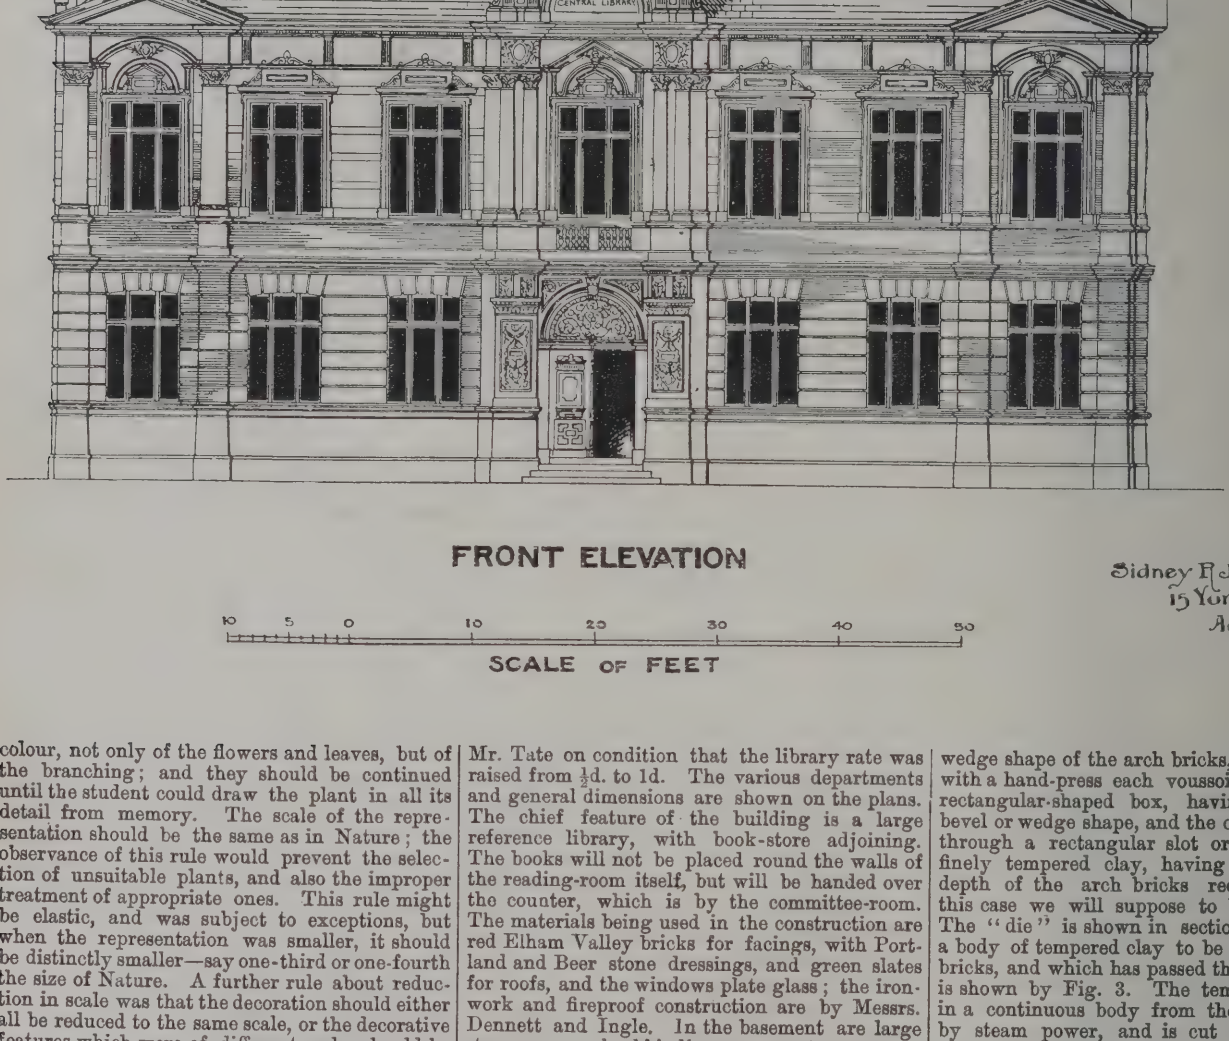
was read by the President, who commenced with a review, retrospective and prospective, of the subject of examination. There were, he remarked, some within the Institute as well as outside of it who were opposed to the policy of examination, and who, considering it prejudicial to the welfare and highest interests of the profession, would deprecate its extension. On such he urged that the day had gone by for raising objection or inaugurating opposition. No one could allege that the policy was not maturely considered prior to its adoption in 1882, and its subsequent confirmation by the Royal Charter in 1887, and any who now found themselves honestly opposed to it ought to feel loyally bound to the decision of the majority; and if unable to take an active part in the scheme of examination, they should at least avoid any action which might tend to injure or to minimise the influence of the Institute in the honest endeavour to raise the standard of knowledge and efficiency, and so to promote the highest interests and the credit of the profession. The arguments on which this opposition was based were embodied in a memorial presented to the council, and in a letter which the memorialists published in *The Times* last March, under the title or "Architecture: an Art or a Profession?"—words which appeared to the President to suggest under an attractive form an entirely false issue, and one which was in its essence misleading. To declare that architecture was an art was to repeat a truism; it was not only an art but a fine art, to which in some respects the sister fine arts of painting and sculpture were handmaidens in a sense which could not be said of architecture in relation to either of them. But architecture was more than this. It was an art *and* a profession. To ask whether it was an art *or* a profession was not only to put the subject in an incomplete and a misleading form, but to endeavour to divorce two things which were indissoluble. The unique characteristic of the calling of an architect was that it combined such different qualifications—artistic taste, scientific knowledge, business proficiency. They had no claim to be architects in the true and full sense of the word unless they were artists, able so to dispose and to clothe the materials with which they had to deal as to produce beauty of form and proportion. But they must also be scientists, so familiar with the strength and properties of materials as to combine them in sound construction; and they must, moreover, be men of business, able to protect the pecuniary trusts which were committed to them. The body politic of architecture was composed of parts, each one of which was essential to the unity of the whole, and without any one of which it would be incomplete and useless to society. There were those whose proclivities and aspirations were specially artistic; there were those whose genius was constructive; there were those who *par excellence* were men of business. The ideal architect was the man in whom these qualities were united—who was an artist, a constructor, and a man of business. Any who claimed that he was one only, to the detriment of the others, detracted from the nobility as well as from the unique character of his calling. Further, the memorial said that the artistic qualifications of students, which really made the architect, could not be brought to the test of examination; and, consequently, that the attempt to test the knowledge of art by examination was delusive, and calculated to militate against the interests of architecture as a fine art. He held, however, that art had a history, which there was no difficulty in teaching; and as for the theory and practice of art, were not those systematically taught in architects' offices, in the classes and schools of the Royal Academy in this country, the Ecole des Beaux-Arts and other schools in France, in many kindred institutions on the Continent, and in the schools of art and of design throughout this country? If, then, the history, the theory, and the practice of art were thus imparted by teaching, with what truth could it be asserted that to test such acquired knowledge by examination was detrimental to its highest interests? Much that was valuable, if not essential, to the career of an artist could be, and was, taught, and to test knowledge thus attained could not possibly do any harm, while, on the other hand, it might be, and indeed was, productive of nothing but good to the student. The President proceeded to point out that under the Charter of 1887, while the Qualifying Examination for Associates was from the first made compulsory, the institution of a similar examination for Fellows was rendered permissive only, and might be inaugurated five years after the date of its grant, and that period would expire in March next. In order to assist in forming a correct judgment on the point of the desirability or otherwise of instituting an examination for Fellows, the President inquired what had been the result of the compulsory examination for Associates established in 1882. For the purpose of comparison, it would be only fair to exclude the two years immediately preceding that date, during which an exceptional influx of Associates occurred, from reasons into which they need not inquire too curiously. He would, therefore, take the eight years from 1872 to 1880, and compare them with the eight corresponding years in the succeeding decade—viz., 1882 to 1890. During the former period, the number of Associates who were elected was 246, or an average of 31 per annum, while in the latter period the number of Associates who were elected had been 328, or an average of 41 per annum. This latter average would have been still larger had the whole of the 533 candidates who applied to be examined been passed, or had the whole 366 who were passed been elected. It was, moreover, worthy of note that since 1887, when the compulsory examination for Associates was confirmed by Royal Charter, a remarkable increase in the number of applicants had occurred; for in the four succeeding sessions there were no fewer than 375 candidates, of whom 262 were elected, being an average of 65 per annum. It thus appeared that, while prior to the institution of the compulsory examination for Associates in 1882 the average of annual elections was only 31, since that date the annual average had been 41; and, further, that since the confirmation of the examination by Royal Charter the annual average had been 65. These were facts which could not be controverted, the significance of which was remarkable, affording, as they did, irrefragable evidence that the compulsory examination had not exercised a deterrent effect so far as Associates were concerned, but, on the contrary, had actually formed an incentive and an inducement to join the Institute. Who would say that those 376 Associates of the Institute were not better men, and would not be better architects, from the enforced study and the acquired knowledge that they owed to the compulsory examination? Seeing, then, that examination had resulted in the addition of so large a number of qualified Associates to the list of members, why should not a similar result attend the extension of the same policy to the class of Fellows? The question was not so much, Why should Fellows be subjected, before election, to such a qualifying test? as Why should they be excluded from advantages which the other class of members had derived from it? As the result of a careful review of the whole subject, he expressed the decided opinion that, in pursuance of the permissive powers of the Charter, the Institute should next year declare that on and after a certain date to be specified, "every person desiring to be admitted a Fellow shall be required to have passed such examination or examinations as may be directed by the Royal Institute." In the event, however, of that policy being adopted, it should be understood that the words of the Charter, "But in special cases the Council shall have power to dispense with such examination or examinations," should be liberally interpreted for a period of years, for the obvious reason that there were men now in the profession enjoying extensive practice, to whom, should they propose to join the Institute, it would be manifestly absurd to apply the test of examination. He thought, further, that while they owed a deep debt of gratitude to the board of examiners for their arduous labours gratuitously given during the past nine years, they ought not to expect a continuation of such free services, and the question of remuneration would have to be faced. The President proceeded: Before leaving the subject of examination, let me refer to what some seem to look as its necessary goal — Registration. T inevitable evils which must accompany adoption of any scheme of legal registration admitted, even by its most ardent advoca The preliminary question, therefore, which r on the threshold of any consideration of the s ject is whether these evils are likely to be o weighed by counterbalancing advantages? I no doubt, regrettable that anyone, whet qualified or not, should be at liberty engrave "Architect" on his doorplate; it would be vastly worse, and only ju fiable under the pressure of the grav necessity, to legally register as a qu fied architect every carpenter, auctioneer, undertaker who now has the effrontery to himself so. And, after all, is the existing so great as it is made out to be? It may thought a little humiliating to find tradesm assuming to be qualified practitioners in a lear profession, but the pretension is so absurd a secure its own defeat. There are a suffici number of educated and qualified architects the public have not such intelligence, and reg to their own interests, as to discriminate between them and the persons I have refer to, no Act of Parliament will endow them wit any more than it will prevent quacks from find means to impose on them. The Archite Registration Bills which in recent years h been promoted in the House of Commons h failed in providing machinery that would rem this evil. The mere enactment that no could, under penalties, use the word "architec unless legally registered would not meet difficulty. There are numerous and obvi loopholes for the evasion of such legislation. object to the proposed Registration Bill, because it is not called for; an essential p liminary to such legislation being that it demanded by the profession, instead of be promoted by a few individuals who can in sense be said to represent it; and (2) becaus would inevitably fail in effecting the object forth in the preamble. So far, therefore, am concerned, without doubting the *bona fid* the promoters, I shall continue to oppose, by influence I possess, such crude and uncalled attempts at legislation, which have only ten to confirm my original conviction that remedy would be worse than the disease. President deprecated in passing the invari custom of placing the initials F.S.A. be those of F.R.I.B.A., as though it were consid that to be a Fellow of the Society of Antiquar was a better qualification for an architect t to be a Fellow of that Institute, and proce to deal with the financial question, marking that while they had enough pay their way, there ought to be a la margin between income and expendit He asked each member to endeavour to ind others to join, and referred with satisfaction the fact that another provincial body, the Dur Institute of Architecture, Science, and Art, seeking alliance with them. Much inconvenie had of late years been experienced in Lon practice by the complications arising from numerous additions which had been made different times to the Metropolitan Building of 1855. It was satisfactory, therefore, that Local Government Board proposed to introd during the ensuing session of Parliament "London Building Law (Consolidation) Bi the object of which was stated to be "to c solidate the Metropolitan Building Acts" "certain sections of the London Council (Gen Powers) Act 1890." But the Metropoli Building Acts required not only consolidat but amendment. He pointed out to Mr. Rit the necessity of accompanying this measure an Amendment Bill, inasmuch as only by m of consolidation and amendment, could the Bu ing Acts meet the requirements of the pre day. The Practice Standing Committee, du the last two years, had been engaged in the of preparing a complete draft of a sugge Amendment Bill; and this, when it had b approved by the Council, would be forwar to the President of the Local Governm Board. In referring to the new departure the Architectural Association embodied in t curriculum, the President said he only regre that they had to find a studio elsewhere, hoped that at some future day the two established architectural societies of Lon might be completely housed under one r While he had never engaged in an architect

ition, believing them to be very nearly an d evil, and not conducive to the real wel- the profession, he noticed with approval ature in the recent competition for the tion of the South Kensington Museum— aving limited the number of competitors t, they nominated four, and requested the l of the Institute to nominate the other while Mr. Waterhouse, as President of the ite, was appointed assessor. He believed is rivals in the competition would gener- concur in their satisfaction that the work en confided to their honorary secretary, ston Webb. The President passingly l to the Congress of Hygiene and Demo- held in London in August, suggesting Sir Arthur Blomfield might well, at a date, further elucidate the suggestive t dealt with in his address, of hygiene ation to art, the connection between was, Mr. Anderson thought, somewhat re-

As to the width of streets, he thought tutory limit to the height of buildings in etropolis of 90ft., prescribed last session, oo high, and should be reduced to 70ft. g the last six months, the President con- , we have suffered inconvenience from the of the carpenters and joiners of London, he lock-out by the master builders which l. All must deplore the necessity—if ity there be—for resorting to such methods ling with the constantly-recurring disputes en the representatives of capital and labour, arily destructive as they must to a great t be of that feeling of mutual confidence respect which should subsist between yer and employed. The strike in question he result of a claim on the part of the men orter hours and a higher rate of pay per -a claim which was resisted by the masters e ground that it would increase the cost of r to the extent of at least 11 per cent., , in their opinion, the state of trade would ustify any increase at all. At any time I not much faith in the interference of out- in trade disputes, because, although they o doubt actuated by the best of motives in ng their services, they are not always quali- y the possession of technical knowledge for osition they seek to occupy; but when, by e of my official position as President of the ute, I was approached by the parties to the nt dispute, and when, as the result of a rence, they mutually agreed to refer their ences to my arbitration, I did not feel at y to decline the proposal. While fully ciating the confidence and trust reposed in as your representative, you may readily re that the position is a most arduous one, ving grave responsibility. I do not need to e you that my award will be the result of us consideration and exhaustive inquiry. gh in the nature of such things it is scarcely expected that it can be perfectly satis- ry to both parties, I venture to indulge the that it may at all events conduce to the ate welfare of the great interests involved. e mean time, it is something to be thankful that in many a saddened home the glad gs have been welcomed, that the miseries privations which have been the necessary npaniments of the Carpenters' Strike have terminated. Contemporary architecture its vigour and originality of treatment, and y features that command admiration, even much that is discouraging. When, for ple, we reflect that of the thousands of es erected yearly in this metropolis, the vast rity are not designed by architects, but by s and employees of speculating builders, is tempted to despair of the domestic itecture of London; and it does seem ge that in face of this patent fact, the ic and the daily press persistently make itects responsible for abortions with which have had nothing whatever to do. It is enough to be deprived of the opportunity, pt in comparatively rare instances, of show- what our Domestic architecture might be if gned by specially educated artists; but it is strous that, although so deprived, we should be held responsible for the grotesque pro- ions of men who are uneducated, and whose ds are innocent alike of refinement and taste. oes not necessarily follow that every product n architect's brain must be beautiful and mand admiration. Truth compels the ission, that in the midst of much that is itorious and beautiful, there is not a little to regret in the work of contemporary architects, and it behoves us not to cast stones unless we are ourselves without sin. In much of the architecture of these latter days there seems too often to be an overstrained and unnatural craving for novelty. Some recent buildings, indeed, would seem to declare: Perish fitness, perish consistency, perish beauty, but at all hazards, Novelty! There is such a thing as selfishness in design: the indulgence in quaint personal conceits or idiosyncrasies, not necessarily beautiful because novel, instead of the manly effort to curb mere selfish quixoticisms, and to produce results which will be pleasing to the refined taste of others, because in harmony with what is beautiful. But it is surely possible to be unselfish in art as in life, and to indulge in almost infinite variety of treatment without offending the educated taste of others by disregarding those principles of artistic design which the testimony of past generations has approved as contributing to beauty. A noticeable instance of selfishness in architecture is afforded by the additions to King's College now in course of erection at the eastern end of the river façade of Somerset House. I know not what justification can be urged for that building on the plea of necessity; but to have studied the requirements of accommodation only, without regard to cherished surroundings, is selfishness of the worst description. One would have fancied that the façade of Somerset House would at least have been held sacred from innovation or injury, and it is with astonishment and grief that I see one of the grandest public buildings in London wantonly sacrificed to the unneighbourly selfishness of modern utilitarianism. Should it be possible still to take action with the reasonable prospect of a successful issue, I shall be glad to join in any movement having for its aim the removal of a structure which cannot fail to excite the indignation, not merely of lovers of art, but of all, because our public buildings are trusts for the protection of which each generation is responsible. In conclusion, he urged that the true principles of design should never be set aside for any considerations of novelty, however tempting. They might in their architectural creations conform to established canons of art, and yet freely indulge the fancy in infinite variety of treatment, whether of form, or ornament, or colour. In our contemporary architecture he longed to see the more apparent recognition of such controlling principles of design: even in their too common absence he discerned elements of hope and promise, the true development of which would inaugurate what he for one regarded as "a consummation devoutly to be wished," the advent of pure Classical taste.

Mr. A. Waterhouse, R.A., past-president, proposed a vote of thanks to the President for his address. The recent controversy as to whether architecture was an art or a profession was not to be regretted, and the President's definition of an architect as a three-sided creature—an artist, a skilful constructor, and a man of business—put the whole matter in a nutshell. The President was equally happy in his description of the result of the obligatory examinations, which had been most successful, and were destined to be still more so when made progressive. With regard to the election of Fellows, he supposed that they would in future be mainly recruited from the ranks of the Associates; but, personally, he hoped a door would always be left open for the admission of any architect of proved ability who should not have been so fortunate as to have passed the examination. They all cordially agreed in thanking the board of examiners, whose performance of their duties had been beyond all praise, and also beyond any recognition the Institute could hope to offer them, although he agreed that they should be remunerated. He cordially concurred in the tone of the President's closing remarks, deprecating selfishness and unneighbourliness in executing works; indeed, there was for all a vast field open for self-abnegation in this respect.

Lieut.-Col. Lennox Prendergast, Hon. Associate, seconded the motion, which was carried by acclamation, and briefly acknowledged by the President.



Mr. Aston Webb moved a resolution expressing the regret that the members felt in seeing the additions now being made to King's College, which were damaging to the noble river front of Somerset House, and requesting the Council to communicate with H.M. Office of Works and with the authorities of King's College on the subject.

Mr. J. Hebb thought that H.M. Office of Works had nothing to do with the work; but Mr. Webb replied that they had leased the land to the College. Mr. A. Payne regarded the resolution as not half strong enough; but Professor Kerr, in seconding the motion, expressed his belief that the authorities of King's College would, if representation were made to them in the courteous tone adopted in that resolution, be willing to ameliorate the unsightliness of the addition. Mr. William Woodward asserted that the work was being done under the direction of a Fellow of that body; but an expression of feeling was manifested that the name should not be mentioned. After some further discussion, the resolution was unanimously adopted.

THE DECORATIVE TREATMENT OF NATURAL FOLIAGE.—III.

EDUCATED NATURE was the chief topic of Mr. Hugh Stannus's third Cantor lecture, an epitome of which we reproduce from the *Society of Arts Journal*, by the author's permission. The lecturer observed that while the whole of the vegetable kingdom was at man's use for decorative purposes, he possessed, and should exercise with discretion, his right of selection or rejection. For the ordinary decorative work, the selection would be limited by æsthetic considerations, only such plants being chosen as appeared beautiful at first impression to the eye. Plants of ordinary growth should be chosen. Some orchids and other flowers, which appeared to be freaks of nature, were interesting in scientific botany, but were not useful in artistic pattern-work. If the interest of the observer were attracted by the representation of a rare or abnormal flower in the pattern, and he proceeded to examine it closely with the attention of a botanist, but found the representation inadequate, as it necessarily would be as a consequence of the technical exigencies of pattern-work—he was disappointed and tantalised. It was, therefore, better to avoid odd or rare plants, and to select those which were familiar and numerous. Simple plants should be chosen. Those which were too intricate and minute should be avoided. In judging of this, artists had to take the material into consideration. Flowers with much detail in stamen and pistil might be possible in embroidery, but were impracticable in mosaic; and leaves that were much divided were easy in printed work, but would be difficult to couch in embroidery and troublesome to fit in inlaid work. Single flowers were most easy of treatment, and double and compound flowers should be avoided by the student. Greenhouse plants, as a general rule, should be avoided, and also gardeners' flowers without exception. The gardener aimed to produce something *new*; the artist sought to do his best with the old. The gardener aimed to produce *double* flowers; for the artist the simple beauty of Nature sufficed. Malformations should be avoided, and so also should all plants of strongly marked individual characteristics, and the so-called ornamental flowers. The objection to the latter class which included the ivy, convolulus, fuchsia, and geranium, was that the shapes were too pronounced to coalesce into the general texture of a pattern. Hackneyed flowers and symbolic plants should also be rejected. Ramifying plants were most easy to use in connected work, the division into branches lending itself to the diffusion of the pattern over the ground, and bulbous plants were useful in powderings. Supple plants were more easily treated than those with rigid stems and branches. The student should select his plants with reference to the space to be filled. In panels of ordinary forms any plants might be used, but in panels of extreme shapes the choice was limited by the characteristic manner of growth of the different plants. A sufficiency of leaves to overlap the stem at intervals was necessary. Leaves which were broad in comparison with the stems were good, when narrow there was a want of clearness, and the pattern might have a "liney" effect. It should be remembered that line and shadow were characteristic of artificial foliage, while in natural foliage mass and colour were necessary. Dissimilarity between the leaves and petals in mass-shape, edge-treatment, colour, or texture was helpful; when the flowers and leaves were the same in shape or colour, a want of variety and clearness was felt. The preliminary studies of the selected plant should be made from various points of view, carefully copying the method of growth and

SCALE OF FEET

colour, not only of the flowers and leaves, but of the branching; and they should be continued until the student could draw the plant in all its detail from memory. The scale of the representation should be the same as in Nature; the observance of this rule would prevent the selection of unsuitable plants, and also the improper treatment of appropriate ones. This rule might be elastic, and was subject to exceptions, but when the representation was smaller, it should be distinctly smaller—say one-third or one-fourth the size of Nature. A further rule about reduction in scale was that the decoration should either all be reduced to the same scale, or the decorative features which were of different scales should be applied in different parts of the scheme, and there should be strongly-marked dividing-lines between them. Mr. Stannus held that the aims in design with natural foliage should be:—(i.) Clearness in the composition; (ii) naturalness in the treatment; (iii.) acknowledgment of the prescribed shape; and (iv.) distribution over the given surface. As to the first point, a general direction was that the student should not attempt to represent subtle foreshortening with incomplete technical appliances. Some thirty of the faults which should be avoided were pointed out, among them the overlapping of flowers by leaves or stems, the covering up of the ground by leaves, double complications (such as the twisting of leaves and then overlapping in the same design), the covering of the ends of leaves, coincidence of edges and of centre veins, the overlapping of half a stem, touching of leaves, alignment, and axiality. These suggestions were all negative, the author remarking that no positive rule was necessary in the treatment of nature. The rules were all to the end that the design should be kept clear (*i.e.*, simple and easy to comprehend) and natural (*i.e.*, that the artist should withhold all artificial interferences of his own ideas), and should give nature a chance. He could not, by taking thought, improve upon it: he should see that he did not, by extraneous treatment, spoil its beauty.

TATE CENTRAL LIBRARY, BRIXTON.

THIS building, which is now being erected, is the second gift of Mr. Henry Tate, J.P., to the parish of Lambeth, and will cost (with the site) £15,000, this sum having been promised by Mr. Tate on condition that the library rate was raised from ½d. to 1d. The various departments and general dimensions are shown on the plans. The chief feature of the building is a large reference library, with book-store adjoining. The books will not be placed round the walls of the reading-room itself, but will be handed over the counter, which is by the committee-room. The materials being used in the construction are red Elham Valley bricks for facings, with Portland and Beer stone dressings, and green slates for roofs, and the windows plate glass; the iron-work and fireproof construction are by Messrs. Dennett and Ingle. In the basement are large store-rooms, bookbinding-room, strong-room, staff-rooms, heating-chamber, &c. The contractors are Messrs. F. and H. F. Higgs, of Station Works, Loughborough Junction, S.E., and Mr. E. L. Schneider is clerk of works. Mr. Sidney R. J. Smith, A.R.I.B.A., 15, York-buildings, Adelphi, who has also done two other libraries and other works for Mr. Tate, is the architect.

NOTES ON TERRACOTTA.*—IV.

TREATMENT.

IN terracotta not infrequently is seen the extrados of voussoirs formed to a brick size, that is 3in., and continuing in one unbroken brick to the intradosal curve, as at *a*, Fig. 1. This, of course, is a matter to be determined by the cultured and refined taste of the architect. It is mentioned, however, because of the likelihood of these monosyllabic voussoirs—if one may so speak—being less true in form than those made up of the conventional lengths of 8in. and 4in. respectively, as at B, Fig. 1, and which long usage and custom sanction as the most pleasing proportions. If the voussoirs are to be in one piece, then it would be better, perhaps, to quite depart from the brick size altogether, and treat the arch from a stonework point of view, with "loaded" terracotta voussoirs. The concentric curve of the label mould is more accurately retained, both in the manufacture and the fixing, by working it to brick sizes, *i.e.*, 3in. or 4½in. measured along the line of curve.

There are two ways in use of producing the wedge shape of the arch bricks, one by press with a hand-press each voussoir separately i rectangular-shaped box, having the requi bevel or wedge shape, and the other by press through a rectangular slot or "die" a body finely tempered clay, having the height depth of the arch bricks required, which this case we will suppose to be 12in. by 4 The "die" is shown in section by Fig. 2, a body of tempered clay to be cut up into ar bricks, and which has passed through the "di is shown by Fig. 3. The tempered clay iss in a continuous body from the "die," wor by steam power, and is cut off by the cl worker in suitable lengths by means of the w or bow-saw, Fig. 7. The detached portion clay is now placed in the arch-box, Fig. 4, or work might so be arranged that the clay iss direct from the "die" into the arch-box, wh is so arranged that the clay-worker, by forci his wire or bow-saw down the correspondi slots *a a*, *b b*, *c c*, *d d*, E E, F F, will divide block of clay into so many voussoirs or ar bricks, and by an additional cut in the direct of the length of the box, he can divide them i 8in. and 4in. pieces, as at B, Fig. 1, if necessa In producing solid voussoirs by this la method, it is generally found necessary to fi "bell" at the bottom of the "die," at *c*, F 2, for the purpose of compacting the clay forcing it into the angles of the "die," wh otherwise it might not fill. The resulting bl of clay is therefore produced with a correspondi hollow, as shown at D, Fig. 3, and at F in arch-brick, Fig. 5. In the process of dryi the contraction is not equal, owing to the holl in the back edge of the brick, the contracti being greatest at the front edge in consequence the greater amount of clay present. Consequent the solid voussoirs when fired are found to ha more or less, hollow faces, as shown somewh exaggerated by the dotted concave line, Fig. the hatched lines, representing the brick wh pressed in the clay, and the dotted lines the br when dried or fired. This is another reas against forming the arch-bricks in one unbrok piece, as at *a*, Fig. 1. The hollow is formed a to save the cost of railway freightage. T label mould, Fig. 1, when made up of brick si is generally formed of moulded bricks wh sides are at right angles with the top and bott beds. The label mould should be pressed throu

noulded "die," and on to a receiver having the rvature of the outer curve of the label, as seen ıen surmounting the arch, but inverted. The lial joints can then be cut in an arch-box some- ıat similar to that already described, but having oncave bottom of the same curve as the re- ver. There are many ways of doing these ings which suggest themselves to the practical d intelligent worker.

The "die," or slot, is generally made of beech- ood, lined with fine moleskin attached to the ner faces by being tacked on with small clout ils. The moleskin has to be carefully stretched d accurately fitted into the profile for obvious asons. The moleskin is necessary to obviate e friction that would otherwise be set up be- een the wood and the clay in the passage of the ter through the "die." One effect of the moleskin ing is to deprive the resulting clay of sharp rises, a very necessary precaution in the manu- cture. The edges of all terracotta should be ghtly, but not appreciably, rounded, by which eans they are less likely to get flushed, either the stages of production or during transit to eir destination.

The camber, or flat arch, so-called (Fig. 8), is rmed in a manner somewhat similar to the gment-arch; but in the camber-arch each oussoir has a different length and bevel. The ode of procedure is as follows:—Set out one-half of the camber, including the key course, take a sheet of tin or zinc, cut it to the shape of the half-arch with the courses marked thereon, and a small V cut to mark each joint on the top and bottom edge, Fig. 9. Place this mould on the upper face of the block of clay, *a*, *b*, *c*, *d*, Fig. 10 (which has been forced through the "die" as for the segmental arch), marking with the edge of a knife the joints on the clay. Reverse the mould, and repeat the operation for the remaining half of the camber, keeping the bottom edge of the mould flush with the soffit of the clay, Fig. 10. The top and bottom edges of the clay block being parallel, there will be some surplus clay to remove at E E, representing the rise or camber of the arch. The arch when *in situ* will be pushed up to the line *a d*, producing the required soffit camber which custom sanctions as $\frac{1}{8}$in. to a foot span. The courses may be cut out by the bow-saw being forced down the outer edges of two trying-squares held at the corresponding joints along the edges, the resulting voussoirs being shown by dotted lines. Where many of these have to be made it would be cheaper to make them in arch-boxes. Fig. 8 is shown in Flemish bond—*i.e.*, 6in., 2in., and 4in. This would necessitate a false-joint (the closure), which, though occasionally done in gauged-brickwork, would be hardly permissible in terracotta. The camber-arch in old brickwork seems to have been treated as embodying the principle of an inflexible truncated wedge, rather than as a lintel containing a secret arch (shown by dotted curves, Fig. 8), the skewbacks being cut to a very acute angle, apparently to increase the area of the resisting surfaces. An angle of from 60° to 70° is now considered the most pleasing angle of skewback.

(*To be continued.*)

HOT-WATER ENGINEERING.—XXI.

Supply of Hot Water for Baths and Domestic Purposes.

Fixing High-Pressure Boilers for Temporary Low-Pressure Purposes.

IT is a very common requirement, when a new range is ordered, that it may have a high-pressure boiler, but only to be in readiness for an apparatus not yet erected, and which may not be wanted for some months or a year to come. The object in having the high-pressure boiler is to save cost and trouble of dismantling the range and changing the boilers when the anticipated system of pipes is erected. This is an arrangement easily made, as a high-pressure boiler, with certain precautions, can be simply adapted to low-pressure purposes only, either for a limited time or for good, should the apparatus never be erected after all.

There are two or three ways of doing this, but that which costs the least in the first instance costs the most when the conversion is effected, and *vice versâ*. The boiler must necessarily be boot-shaped, and is of the ordinary high-pressure character, flued underneath and up the back. As the flues take up a deal of room, this boiler has a disadvantage over the ordinary flueless, low-pressure boot-boiler, in not holding so much water.

Sometimes the work is arranged by simply substituting a flued high-pressure boiler for the low-pressure one, and fixing it as Fig. 72 in the last paper; and to prevent its heating too much, the flue under the boiler is stopped up with fire-brick, which is, however, removed when the conversion takes place. This is not a method to be recommended, as when the pipes are afterwards about to be connected, it becomes necessary to partly, if not wholly, unset the range, and a deal of extra work is entailed. The cheapest commendable method is to put in a flued high-pressure boot-boiler, and to connect the flow and return services in the usual way, and carry them

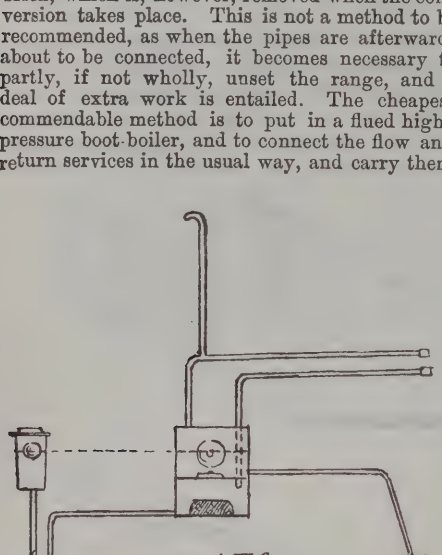

FIG 74

through the jamb as Fig. 74. The ends of these pipes must be capped (closed); but the flow pipe would have an expansion pipe connected to it as shown. The cold supply and draw-off services would be connected in the same manner as explained in the last paper, and as shown.

As this is a flued boiler, and the flues will be needed when the system of pipes is connected to it, it is best to complete it in this respect when first setting the range, making the back flue to the boiler, and putting the necessary damper in it; but stopping up the flue under the boiler with firebrick until such time the conversion takes place. If the flue is not stopped, and the flame is allowed to pass under and up the boiler while it is used for low pressure purposes only, the boiling will be so furious as to be unbearable.

When the time comes for the hot-water apparatus to be connected, the whole system of pipes can be completed down to the kitchen floor before the range is interfered with. Then, when the pipes are ready for connection, all that has

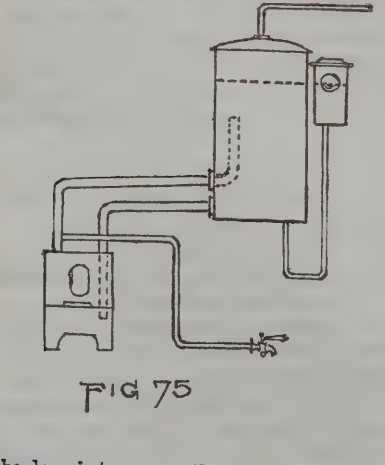

FIG 75

to be done is to uncap the flow and return from the boiler, connect them with the new services; then stop off the expansion pipe and cold supply services, but the draw-off service can remain. If the new apparatus is on the cylinder system, then this draw-off will be objectionable; but if the tap has a loose key it can be retained as an emptying service. By arranging the pipes in this manner it will be seen that the range fire need only be put out for a few hours when connecting up.

If there is a certainty of the conversion taking place, there is a still better method that can be adopted. This method is a little more expensive in the first place; but is ultimately cheaper when the apparatus is completed. By this arrangement the cylinder is introduced into its proper position to remain there permanently, as Fig. 75. Between the cylinder and boiler is carried the necessary flow and return service, of full size, and not to be afterwards interfered with. Thus far the apparatus is similar to what would be erected if the complete system of pipes was to be added at once.

When the cylinder (of full size) is used in this manner the flues to the boiler are completed and left open. It would not do to stop them with fire-brick as suggested with the last method, as we have nearly the full bulk of water to heat in this case. The expansion-pipe is commenced from the top of cylinder, as shown, but is almost immediately turned off, and terminates either over the feed-cistern or through an outer wall, as until the conversion takes place it acts as a steam-pipe only. The cold supply is furnished by a feed-cistern and ball-valve, arranged to fill the cylinder about three-fourths full. The cylinder can have a flange near the top in readiness for the secondary return, but it must be plugged until such times as it is needed. The temporary draw-off service should be taken from the flow-pipe near the boiler, and either carried to the jamb or other low point. It should not be carried up anywhere level with the cylinder, as it has afterwards to answer as an emptying service.

When the conversion is effected in this case, there is little to be done beyond the actual carrying out of the system of pipes contemplated. The junction of the new services with what exists is simplicity itself. In the first place, the cylinder and boiler and the flow and return pipes between them are complete and need no alteration. The expansion-pipe (secondary flow) from top of cylinder has to have part of it removed, and is then united to the new service. The secondary return is connected into the cylinder, the flange being provided ready for it. The cold supply requires the feed-cistern and ball-valve taking out of it, and a stop-cock inserting, and this is complete, supposing the service to the ball-valve was not taken from one of the general house services and that it is of full size. The draw-off service from the primary flow must now be considered an emptying service, and the tap should have a removable handle. It will have been understood that when providing the cylinder in the first place, it must be of sufficient strength to withstand the pressure it will afterwards experience when in direct connection with the house cistern.

The next paper will treat of estimating.

(*To be continued.*)

MODERN FARM BUILDINGS.*

A PRACTICAL work on farm buildings has long been wanted,—we mean one that will give, not merely the structural details, but the agriculturist's and land agent's views. Mr. A. Dudley Clarke, F.S.I., land agent, has brought out, in book form, a series of articles which have recently appeared in the *Estates Clerks of Works Journal*, which lays down, in a convenient form, the principles of homestead planning. Mr. Clarke has avoided writing what is so common nowadays—an elementary treatise on buildings of this kind, in which details of all kinds are given, but few plans. He has rather plunged into the principles of arrangement which should be observed in planning these buildings. There has been a great deal too much waste in the buildings and food preparation arrangements, resulting in the erection of homesteads entirely unsuited to the requirements of the farm; the stock has been placed a long distance from their food stores; these latter have been badly arranged for access of carts, preparation, and mixing, and often placed in the wrong position for sheltering the yard's stock. In a good plan the buildings should, as far as possible, "fence themselves in" with the roadways. Mr. Clarke gives a model plan on the "block" or "attached" system w he designed for the Royal Agricultural Soci Kilburn Show, which received a silver medal is for a farm of 400 acres, 100 of which is past The accommodation for stock is large, as requirements were for a highly productive f chiefly arable. The plan occupies a rectan the food stores are located on the north, and of the long sides, projecting from which at r angles are three blocks of buildings, the ce one is cow and bullock houses, and the side are piggeries and stables. Intersecting th three ranges or blocks is a feeding passage, wh divides the intervening open spaces into covered yards, two for eight beasts each, and for ten beasts each. A roadway at each the narrower ends, parallel to these blo separates the implement and poultry shed, the cart and implement shed, which sheds f the boundaries on the east and west sides. Th is also a south roadway which cuts off the end the four blocks we have mentioned, and two o yards and sheds. This system places cattle food stores in the centre; the west side being horses, carts, and implements; and the east the domestic stores, pigs and fowl houses, latter being on the farm-house side. The blo economise building, and form admirable shelt to the yard on the north, east, and west sid "The roofs," says the author, "are par carried on brick pillars, 10ft. 6in. apart, fr centre to centre, and the compartments divided by dwarf walls, 4ft. 6in. high, exc the stables, the wall of which is carried up to t eaves in order to keep the circulation of quite distinct from that in the yard." Econo is effected by this dwarf walling. The yards covered or open with lean-to sheds on south food stores to form feeding passages and sp roof sheds for the middle feeding passage a boxes to south yards. Corrugated iron is su gested as a covering for the yards instead of h slating, fixed without rafters on the purli Several points of advantage are to be found in th arrangement. The food stores form two-sto buildings on the north side. The straw and cat food are well together, and can be easily mixe Grain or cake in the granary above can trucked into the adjoining cake room and grou and shot down to the mixing room below. Th under one roof is the straw barn at the we end, the mixing floor; and over the chaff-cutti floor, the root house; and over the corn and ca stores, the fodder and winnowing floor. T communication between these upper stories fro the straw barn allow a waggon laden in the ba to unload under cover, and the hay for cutti corn and cake for stock, to be trucked along its proper stall. Saving is effected also by t winnowing floor being below the granary. Oth points are the position of the cart shed a implements in one block to the east near to t stables, the doors in mixing-floor to admit hor and cart for prepared food, &c. The concentr tion of labour is aided by a homestead of th compact class, where the stock can be attende to and fed under cover. A simpler a more economical plan is shown in Fig. designed for a farm of 400 acres, on third of which is pasture. In this pla the outer wings or blocks on the east and we are omitted, and the plan partakes in form of th letter ⊓, the north side being occupied by the foo preparation block, the centre projecting block f cow or bullock stalls, the east block for pigs an cattle near the house, and the west for stables an implements, with a cart-shed facing south at th extreme end. This plan is carefully though out, and shows the requirements of a well-man aged honestead for an arable farm. The wing are a little extended, and return by the cart-she and coach-house and office on the south side but the food block is a little shortened, so that th block plan is nearer a square of about 130ft. eac way. These return ends on the south side hel to shelter the yards. There are forty-four stall for fatting or dairy cattle, and yards for fort more, all easily approached under cover from th food-house. The cattle-yards are well fenced in the two upper ones next food-block are covered Plans for a dairy homestead follow, arranged o the same general principles, also a plan for a arable farm of 250 acres. The author has thu illustrated a useful class of farms, and the smal arable farm plan given represents a good model showing a centre single cow-house for twenty cattle, and an open yard on each side, wit stables and shed on one side, and piggeries an shed on the other.

* Modern Farm Buildings: their Construction and Arrangement. By A. Dudley Clarke, F.S.I., Land Agent, &c. Winchester: *Hampshire Observer* Office.

he remodelling of old homesteads forms a ul part of Mr. Clarke's treatise, and is illus- ed by plans of remodelled farm buildings, ving the rearrangement and adaptation of barns when flail-threshing was in vogue. e valuable observations are made on the stores, and their construction and fittings; on the important subjects of cowhouse con- ction, open stockyards, covered yards; one l king-post roof for a yard of 32ft. wide is vn; also the proper mode of ventilation at eaves and ridge. These are illustrated by ıs and details. Stables, piggeries, and farm- ses and dairies are also briefly discussed. We say that Mr. Dudley Clarke's little treatise be found very serviceable by all agriculturists, l agents, and architects.

BOOKS RECEIVED.

lic Libraries: a History of the Movement, and ual for the Organisation and Management of s-Supported Libraries, by THOMAS GREEN- D, F.R.G.S., 4th edition, revised (Cassell and pany).—Mr. Greenwood's useful manual is ight up to date, several chapters have been ritten, and the volume now extends to nearly pages. The appendices comprise suggestions promoters, opinions of public men, the text he Act to Amend the Public Libraries Acts, 0, including the Schedules, the Museum, and mnasium Act, and sundry other information. he body of the book the same illustrations of ns and views appear, but additions are made. e author has intrusted to Mr. James D. Brown, arian of Clerkenwell, the writing of two pters, entitled "The Formation of Public raries" and "Library Administration," and se will be found to give many useful sugges- ıs. The same gentleman, in conjunction with . J. Potter Briscoe, borough librarian of the ttingham Public Libraries, has revised the ofs. There is a capital and comprehensive ex, compiled by Mr. Herbert Jones, chief arian of the Kensington Public libraries, and volume is very complete.——*Architectural spective:* the operations of the draughtsman drawing a large house in linear perspective, h hints in pen-and-ink drawing, by F. A. RGUSON, architect and surveyor (London: sby Lockwood and Son). This is a practical atise for draughtsmen, and does not attempt enter into theoretical principles. It is fully ıstrated by a series of progressive diagrams of ouse. From a glance at the instructions given, ich are simply stated and illustrated, the young ughtsman may derive an easy method of aining the perspective lines of a building with- recourse to the centrolinead or other more nplicated methods. The plates of illustrations ven at the end of book show the process, the line being first put in. The *modus operandi* of ting the ground-plan on the board, drawing the ound line, horizontal line, height line, and ing the vanishing points is given. Bird's-eye, rspective, interior, or parallel perspective are ated, and the author gives various examples, d a simple method of making a temporary ıtrolinead. The diagrams are clear, but the ded example on Plate 3 does not look right in perspective—the circular oriel, for instance, incorrect in its curve. We can recommend e instructions to all who wish to learn the liments.

A stained-glass window has been placed in the ıth side of the chancel of Otham Church, Kent. is in the Decorated style, consisting of two trefoil aded lights, surmounted by geometrical tracery. ıe light represents the Saviour seated at the well th the woman of Samaria, and the other depicts ›rcas distributing garments to the poor, with two sciples in the background. The artists were essrs. Lavers, Westlake, and Barraud, of Endell- reet, Bloomsbury.

The Mayor of Richmond, Sir J. W. Ellis, M.P., Saturday afternoon laid the foundation-stone new municipal buildings to be erected in Hill- reet. The freehold site of the intended buildings ıd the pleasure-gardens adjoining were the gift of e mayor. The buildings, which are to be con- ructed from the designs of Mr. W. J. Ansell, of aple-inn, will include a council-chamber, over- oking the river, committee rooms, and rooms for e various borough officials. The buildings will of the Elizabethan Renaissance style, the front ced with red bricks, having terracotta or stone rings, cornices, &c., and the roof covered with red e ridges. The cost of the buildings is £13,000. r. Brooking is the contractor.

Building Intelligence.

BEDFORD.—The new grammar school buildings were opened on Thursday in last week. The school has been erected from plans prepared by Mr. E. C. Robins, F.S.A., of London, but owing to his ill-health the superintendence of the work of construction has devolved upon Mr. John Slater, of Bedford-row. It is built on the "central hall" system, the classrooms being built on three sides of a rectangle, the fourth side forming the front elevation. The inclosure forms a large hall for purposes of assembly and entertainments, the number of persons that it will seat being 1,200. The style is Tudor, and the walls are of brick, with Weldon stone dressings. The principal features of the front are the six large traceried windows, the arcades forming the ambulatory, the square tower with turret for flagstaff and niche for the founder's statue, dormer windows, and battlemented walls, with high pitched roofs of tiles. There are 32 class-rooms, accommodating from 30 to 40 boys each, calculated on the basis of 18 superficial and 250 cubic feet for each boy, and the total number of scholars so provided for is 1,026. The contract cost of the main building was £20,000.

BIRMINGHAM.—A new school, which has been erected by the Birmingham School Board in Floodgate-street, was opened on Monday. This is the forty-second school built by the Birmingham board. As the board were limited to a site of 3,019 square yards instead of 6,000 yards which they wished to obtain, instead of erecting a school on the single-story principle, they were compelled to put up a three-story building. The schools are built of brick and terracotta, with concrete floors throughout and double staircases. The total cost of the school is £10,666, and accommodation provided for 1,110 children. The erection of the building has been carried out by Messrs. Sapcote and Sons, to the designs of Messrs. Martin and Chamberlain.

CHARLTON, WANTAGE.—A new chancel, with organ chamber and vestry, was opened on the 28th ult. It is built as an addition to a temporary church, erected 40 years since, and which will remain as the nave until the new one takes its place. The chancel is built of local red bricks inside and out, the eastern end being apsidal, the roof being of pitch pine, panelled, left clean, and covered with Broseley tiles. A two-light window is placed in each of the canted sides, the central space being blank, and a three-light window in south wall. A brick chancel arch and low brick screen separates nave and chancel. The altar is raised four steps, behind which is a simple shelf, with panelling above, and rich silk dossal and wings. The men's and boys' desks are of English oak, and the floor of tile paving, by Carter and Co. The work has been carried out from designs by Mr. Withers, architect, at a cost of £600, by Messrs. Gregory, Whiting, and Stroud, all of Wantage.

EDINBURGH.—The dedication of the new chapter-house of the Cathedral Church of St. Mary was performed by Bishop Dowden on Saturday afternoon. The original design of the cathedral, of which the late Sir Gilbert Scott was architect, included the erection of a chapter-house, and when the cathedral was built the foundations of such an adjunct were laid at the north-east corner of the edifice, but lack of funds prevented its being proceeded with. The design is strictly in keeping with that of the cathedral. The designer of the house is Mr. J. Oldrid Scott, son of the original architect, and the contractors Messrs. Morgan and Sons, Glasgow, the chief partner of this firm having been clerk of works to Sir Gilbert Scott when the cathedral was built. The internal facing of the walls is of Farley Down stone, while the groined roof is of Overwood stone. In form the addition is square, and above the windows the sides assume an octagonal shape. The vault is supported by a central column of polished Shap granite. The floor has been laid with tiles. The cost of the work was about £5,000.

PENARTH.—The new church of All Saints, which has been erected at a cost of about £6,300 in Stanwell-road, was consecrated on Saturday. The church was designed by Mr. Coates Carter, of Cardiff, the diocesan architect, and the contractor was Mr. Purnell, of Penarth. It consists of a nave 73ft. by 25ft. wide between the arcades, and 55ft. between the aisle walls, with a chancel 25ft. by 33ft. The oak seats accommodate 500, and, in addition, there is space for 100 chairs. The east window is of six lights, and has an internal detached order of tracery.

WAKEFIELD.—The walls of the Bishop's Palace at Wakefield are rising fast, and on Saturday week a memorial-stone was laid inside the chapel in the north wall. The building is of "purpose made" red bricks, having stone sills with brick mullions. The covering is to be of blue Welsh slate. The plan consists of a porch with ceiling groined in brick, beneath a low tower of four stories, leading into an outer hall, and large central hall, to serve as a general reception-room, with staircase and lantern and open roof. Out of this hall are entered the drawing-room, chaplain's-room, library, and chapel; and a gallery round leads to the various bed and dressing-rooms. At the top of the front stairs is a lobby, which leads to the examination-hall over the chapel. The chapel is of Domestic character, with a flat ceiling. The dining-room is next the kitchen wing. Accommodation is provided also for twelve candidates for Holy Orders, with a separate chamber for each, approached by a small staircase leading from the hall. Mr. William White, F.S.A., is the architect.

WHITEINCH, GLASGOW.—On Saturday the Orphanage at Whiteinch, in connection with the Glasgow Institution for Orphan and Destitute Girls, was opened. Built from plans by Mr. S. Henbest Capper, M.A., A.R.I.B.A., of Edinburgh, the new home stands on an acre and a half of ground at the west end of Victoria Park. A south-easterly or south-westerly exposure is given to all the principal rooms. On the ground floor are the living rooms. The system of small dormitories has been adopted, six in all being provided for the sixty girls. The bedrooms are on the first and attic floors, special provision being made for the senior girls; and there are lavatories and bath room and offices on each floor, while the sick-room is placed on the first floor. Externally the building is faced with red stone, with darker red dressings, and high-pitched green slated roofs. The architecture is Scottish Domestic of a simple type.

CHIPS.

A memorial cross of Scotch red granite, 9ft. in height, is about to be erected at Bishopthorpe, York, in memory of the late Archbishop Thomson.

The ceremony of swinging the first cable of the North Sydney Suspension Bridge, at North Sydney, N.S.W., which, it is stated, will be the third largest in the world, took place on Sept. 21st. Mr. Howard Joseland is the architect, Mr. J. F. Coyle, C.E., the engineer, and Mr. A. Johnson the contractor.

A memorial tablet to General Gordon has been erected in St. Thomas Church, Exeter, on the southern side, immediately beneath his grandfather's monument, which was erected at the beginning of the present century. The memorial consists of a tablet cut in white marble, with a background of warm coloured alabaster, and has been executed by Messrs. Harry Hems and Sons, of Exeter.

It is now proposed to demolish the old city church of St. Barnabas, Liverpool, and build in its stead a new church in the parish of SS. Simon and Jude's, Anfield.

The east window in the south aisle of Tring Church has been filled with stained glass as a memorial to the Brothers Brown. Mr. C. E. Kempe, of London, was the architect, and the cost was £285.

Mr. T. E. Maltby, for the past four years borough surveyor of Dorchester, has been elected borough surveyor of Guildford, at a salary of £300 a year, from among 160 candidates.

Sir H. Doulton will present a statue in terracotta of Mr. Henry Fawcett, to be placed in the Vauxhall Park upon the site of the house in which Mr. Fawcett died. The model has been made by Mr. George Tinworth. Fawcett is seated, and in the background a winged female figure holds a wreath above his head.

The church of St. Paul's, Holgate, York, was reopened on Friday, after having undergone alterations and additions, at a cost of £900.

The Emperor William went to Berlin on Sunday, and unveiled a new fountain designed by the sculptor Begas, and erected in the Schloss Platz, under the windows of the Old Palace.

Mr. John Bolton, builder, of Cockermouth, has been appointed by the Cumberland County Council Technical Instruction Committee lecturer on "Hygiene," and the lectures are becoming popular.

SCHOOLS OF ART.

Metropolitan Art and Science Schools.—A largely-attended meeting of the supporters and teachers of London art and science schools was held on Saturday, at the Charterhouse School, Goswell-road, to consider the altered position of the schools through recent legislation in promotion of polytechnics and technical education, and as the result of a circular letter from the Science and Art Department, South Kensington, intimating that "in view of the continued operation of the Local Taxation (Customs and Excise) Act, 1890, the grant for apparatus and fittings, and the grant in aid of technical instruction will be discontinued, the former after the financial year 1891-92, and the latter at once." Dr. G. Danford Thomas, chairman of the Bayswater School of Art and Science, presided. It was contended that the successful work of the schools established a strong claim to consideration under any new scheme, and it was urged that the schools could not compete with polytechnics if the latter were exclusively equipped with a practically inexhaustible store of appliances, and with almost unlimited funds. Mr. Black moved a resolution asking the London County Council to help the metropolitan science and art schools, as the provincial schools were assisted by county councils elsewhere in the country. Dr. Forman, speaking as a member of the London County Council, said it would be useless to memorialise the present Council, as the Excise fund was already appropriated to March next in relief of the metropolitan rates, and in that month there would be a new Council elected. Sir Philip Cunliffe-Owen said that in the provinces £750,000 was devoted to purposes of technical education, and most of the money was given towards the development and enlargement of schools of art and science. London ought to take the lead in these matters, and not be behind the country towns. The resolution was adopted, but it was decided to deter the consideration and presentation of a memorial to the London County Council. Further, it was resolved to form forthwith a Metropolitan Association of Science and Art Teachers.

The Royal Female School of Art.—The annual exhibition of the prize drawings of students at this school was opened on Friday at 43, Queen-square. Mr. E. J. Poynter, R.A., has awarded the Queen's gold medal to a chalk drawing of a head by Miss Blanche M. Falcon, the National silver medals to a water-colour group by Miss Alice M. Hake, and a sea holly (water-colour) by Miss Rosie C. Whiteside, and the National bronze medals to water-colour drawings by Miss Sarah Horton and Miss Kathleen Winny. Miss Lucy Gee, Miss Fanny Giles, Miss Alice Hake, Miss Emily Weaver, and Miss Rosie Whiteside took the National Queen's prizes. The scholarships were awarded as follows:—The Queen's scholarship of £60 a year, Miss A. M. Langford; the Mercers', of £30, Miss Hariot Dunnell; the Clothworkers', of £30, Miss Emma Cornish; the Atkinson, of £25, to Miss Clara Reynolds; and two scholarships of £50 each, one for first-year and one for second-year pupils, called the Gilchrist, Miss Rosie Whiteside, and Miss Alice Hake.

The Kendal board of guardians decided on Saturday to rebuild, at an estimated cost of £10,000, the workhouse, the existing building having been condemned by the Local Government Board inspector.

Internal decoration has just been completed at Holy Trinity Church, Guildford, under the immediate superintendence of Sir Arthur Blomfield, A.R.A. The improvements include sanctuary steps of Cornish serpentine, brass altar rails, and the decoration in colour of the interior of the apse, the latter work having been executed by Mr. Joyce. Plans have been prepared by Sir A. Blomfield for enlarging the church by 120 sittings.

A chancel screen at West Bromwich Parish Church was dedicated on Sunday by the Bishop of Lichfield. The new screen is made of oak, and is designed in the Late Perpendicular style, to accord with the architecture of the church. It occupies the full width of the chancel arch, being 26ft. 3in. wide and 15ft. high, and is of five bays. In front of the screen, and standing on detached pedestals, are figures representing cherubim and angels. The screen has been designed by Messrs. Wood and Kendrick, of West Bromwich, and has been executed by Mr. Bridgeman, of Lichfield; while the iron gates are the work of Messrs. Hart, Son, Peard, and Co., of Birmingham.

Engineering Notes.

Ipswich.—The celebration of the widening of Bourne Bridge, a brick and stone structure, was celebrated on Thursday in last week by the borough and county authorities. The former width of 13ft. between the parapets has been increased to 27ft., and there is a wide sweep towards the Strand-road. The crown of the road has been lowered by 2ft. The arch, which is a high ellipse of 38ft., has not been widened. The work has been executed from the designs of Mr. E. Buckham, borough surveyor, of Ipswich, and Mr. H. Miller, M.I.C.E., county surveyor for East Suffolk. For the contractor, Mr. A. Jenkins has superintended the works as engineer. Mr. H. W. Buxton, Ipswich, was clerk of the works. The cost was about £1,300.

CHIPS.

A memorial stone has been placed over the grave of the late Dean of St. Paul's in the churchyard of the Somerset village of Whatley. It is of free-stone, coffin-shaped, with a plain cross on the top. On the west side is an inscription.

All Saints' Church, Rosendale-road, West Dulwich, was dedicated on Saturday. It is French Gothic in style, and consists of unfinished nave, wide north and narrow south aisles, morning chapel, and lofty apsidal chancel. It is of red brick and stone dressings. A notable feature is the freestone screen, which imitates in its mullions and shafts, connected by open metal-work, a three-light window. Mr. G. H. Fellowes-Prynne, F.R.I.B.A., is the architect, and the cost thus far has been over £18,000.

At a meeting of the Society of Engineers, held at the town hall, Westminster, on Monday evening, Mr. W. N. Colam, president, in the chair, a paper was read by Mr. J. H. Paul, on "Corrosion in Steam Boilers."

On the Feast of St. Raphael the Archangel, the new Catholic Church at Kelvedon was solemnly consecrated and opened. The church is a little Gothic building in red brick, with stone dressings, consisting of chancel, nave, and aisle, and containing stained-glass windows.

The new church clock at Uttoxeter was started on Saturday last. The order was placed with Messrs. John Smith and Sons, Midland Clock Works, Derby. The clock has two dials, each 7ft. across, which are illuminated at night. It chimes the Westminster quarters, and strikes the hours upon the large tenor bell.

Sir A. K. Rollit, M.P., opened, on Friday, a Conservative club at Batley, which has been erected and furnished at a cost of about £5,000.

The Halifax town council have decided to invite competitive plans for a technical school in Hopwood-lane.

A new court-house is being roofed-in in Weld-road, Birkdale. It adjoins the town-hall, and has cost the Lancashire County Council £4,000.

The mural decorations of Folkestone Parish Church are being rapidly proceeded with, Mr. A. O. Hemming being now engaged on a large painting on the south wall at the western end of the nave, representing the reception of St. Augustine by King Ethelbert on the Isle of Thanet. Above the picture there are canopies containing figures of St. George and St. Patrick. Another scene in the history of the English Church is to be placed on the opposite wall, and canopied figures of St. David and St. Andrew.

The police station at Camberley is approaching completion. It is built on the same lines as those at Farnham and Wokingham—in the Early English style, and of red brick. The upper floor is weather tiled with Broseley tiles, faced with "club" tiles. There are two entrances. The porch to the left leads to the office, to be used as an occasional court. Behind this are three cells, solidly built of concrete. To the right are the sergeants' quarters. The work has been executed by Mr. T. K. Kingerlee, builder, of Oxford and Guildford, Mr. C. H. Howell, the county surveyor of Surrey, being the architect.

At the Gateshead town hall, on Friday, Major-General Henry Darley Crozier, R.E., on behalf of the Local Government Board, held an inquiry into applications of the Gateshead Corporation to borrow £24,550 for improvements in the borough. The first application was to borrow £20,000 for works of paving. The second application was for leave to borrow £4,550 for district police-stations at Sheriff Hill and Teams, and the purchase of a steam fire-engine and appliances for the central police-station at the town hall. There was no opposition to either of the schemes, which were explained by Mr. Bower, the borough surveyor

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opini our correspondents. All communications shou drawn up as briefly as possible, as there are claimants upon the space allotted to correspondent

It is particularly requested that all drawings an communications respecting illustrations or literary m should be addressed to the EDITOR of the Bui News, 332, Strand, W.C., and not to members o staff by name. Delay is not unfrequently othe caused. All drawings and other communications sent at contributors' risks, and the Editor will undertake to pay for, or be liable for, unsought cont tions.

Cheques and Post-office Orders to be made payab J. Passmore Edwards.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part o United Kingdom; for Canada, Nova Scotia, and the Un States, £1 6s. 0d. (or 6dols. 30c. gold). To Franc Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brin £1 10s. 4d. To any of the Australian Colonies or Zealand, to the Cape, the West Indies, or Natal, £1 6s.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Adver ments, Public Companies, and all official advertisem is 1s. per line of Eight words, the first line countin two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellan and Trade Advertisements (except Situation adver ments) is 6d. per line of eight words (the first counting as two), the minimum charge being 4s. 6d 40 words. Special terms for series of more than insertions can be ascertained on application to the lisher.

Front Page Advertisements 2s. per line, and Parag Advertisements 1s. per line. No front page or parag Advertisement inserted for less than 5s.

Situations.

The charge for advertisements for "Situations Vaca or "Situations Wanted" is One Shilling for Twen four Words, and Sixpence for every eight words a *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach office not later than 3 p.m. on Thursday. Front-p advertisements and alterations in serial advertisem must reach the office by Tuesday Morning to secure in tion.

NOTICE.

Bound volumes should be ordered early (price Tw Shillings each), as only a limited number are d up. A few bound volumes of Vols. XL., XLI., XL XLIX., L., LI., LIII., LIV., LVIII., LIX., and may still be had, price Twelve Shillings; all the o bound volumes are out of print. Most of the back n bers of former volumes are, however, to be had sin Subscribers requiring any back numbers to comp volume just ended should order at once, as many them soon run out of print.

Legal.

ARCHITECT'S AUTHORITY.—I.

ART from the powers given him by the con- an architect employed by a building owner lo various things within the scope of his al authority. But this agency is subject to s limitations. For instance, where his asks him to get out plans, and to get in rs and estimates, he yet has not legal power ter into a contract with any particular er, although the price offered may be within fixed by the owner. Indeed, a proper formal act is a legal document, and being the one which the subsequent rights of all the es may depend, it requires to be carefully n, and is, properly speaking, the work of a er, rather than of an architect. Of course, contracts, especially where simple, are n up by architects, and often upon printed s; but without the owner's express instruc- there is no implied authority in an archi- as a general agent to bind his client in this The price to be paid is of much importance, limit should be, as it generally is, fixed between the parties. Where this is left , and the architect is authorised to order to be done, the builder doing it can recover air charges from the building owner, even gh his instructions have been exceeded. ie duty, as well as the power, to superintend uildings erected under his plans and draw- is thrown upon the architect by virtue of ffice, independently of any contract in which would be expressly provided for. Although rchitect's authority over the builder and the rs is pretty absolute in its character, he still no implied power to dismiss the contractor has been engaged upon the building. But, ourse, such a power can be, and sometimes is, rted in the building contract; while there is rally a distinct clause authorising the archi- to dismiss any workman of whom he dis- oves. As to sub-contracts, these must all ased upon the main or original contract, and rchitect has no implied power to order sub- ractors to do work not included in the general ract; nor can he render his employer liable ntering into subsidising contracts with them, ther it be for the original work contemplated or alterations, unless, of course, he is ex- sly employed to do so. In fact, legal diffi- ies have generally arisen by reason of itects exceeding their implied authority as nts of clients, and doing things which these er have afterwards refused to ratify.

FRED WETHERFIELD, Solicitor.
, Gresham Buildings, Guidhall, E.C.

OTE.—All questions for reply in this column st be headed "BUILDING NEWS," and must h my offices, as above, by *Tuesday* morning nsure answer same week.

OVINCIAL.—AGREEMENT.—(1) This agreement would, ink, under its special terms, be taken in law as a sub- sion to the arbitration of the surveyor mentioned, but ndertake the work a valuer's license would be uired. (2) The certificate (which would, in fact, be ward) would have to be stamped as such, especially if e was likely to be any disagreement. (3) Either the ler itself or the acceptance must be stamped before it be given in evidence, as they constitute together the ract between the parties. Of course, by paying the alty the question of stamping can be got over, and need not be paid until it is actually called upon to be duced, or is tendered in evidence.

. T. W.—CLERK OF WORKS.—This is an ordinary stion between employer and employed. You were aged as clerk of works, and the building was stopped in progress to settle a question of ancient lights—a very usual thing While question of lights is being discussed you are kept on taking levels, and so on, and now the employers refuse to pay wages for the time the actual building was stopped. The architect thinks they are liable, and so do I, that is, if no receipt or document has been signed in satisfaction.

W. R.—AWARD.—There is no special form for such an award. Any clear statement of decision in reference to the matter of the reference would be sufficient. The stamp upon so small an amount would be threepence.

M. M.—NOTICE TO QUIT.—This notice must generally be given so as to include the full time necessary. But a customary half-year's notice under a yearly tenancy means a notice expiring on one of the usual quarter days. Then a six-months notice to quit at midsummer day, served on the preceding Christmas day is sufficient. Certainly 12 o'clock at night is the time when one day ends and another begins.

R. G. P.—LANDLORD'S REPAIRS.—Even if a landlord is bound to repair, a tenant cannot do so without first calling upon his landlord to carry out his covenant. Nor when there has been a breach by the landlord can the tenant deduct the damages from the rent, as against a distress, although, of course, he could set them up as a counter-claim if sued for rent by action. As to wrongful inclosures of roadside waste, the best form of procedure would depend on the whole facts of the case.

J. J.—DAMAGE TO OLD PROPERTY BY NEW BUILDINGS.—You would, I think, be liable for any damage done to foundations of adjoining cottage under the special circumstances. It is not quite the usual case of "right to support." As a general rule you would only be liable if the excavations were done negligently and without giving the adjoining owner any warning to afford him an opportunity of protecting his property. The best course here would be to make some arrangement with the owners of the cottages first, so as to escape a possible liability.

H. B. L.—ARCHITECT'S CERTIFICATE.—The contractor cannot impeach the architect's certificate as to anything within its scope according to the contract, unless he can prove fraud or otherwise. The question of arbitration is a different matter, and applies only to disputes beyond the range of the certificate. Of course, the contractor can bring an action against the owner if he likes, but, upon what is stated, he would lose it certainly.

LEGAL INTELLIGENCE.

IN RE R. JOSE.—A meeting of the creditors of Richard Jose, builder, of 9, Trehaverne-place, Truro, was held at Truro on the 27th ult. Debtor's statement of affairs showed liabilities £2,004 and assets £207. After deducting preferential creditors a deficiency was left of £1,800. The debtor attributes his failure to want of capital, losses by fire, losses on building contracts, and losses on the sale of dwelling-houses erected on speculation. Debtor commenced business in 1882, with a capital of £60, of which £30 was borrowed. The bankrupt has been building houses on speculation, having from time to time obtained loans to enable him to carry on his business. The Official Receiver reported that the debtor had mortgaged the buildings as they have been erected, whilst the merchants who have supplied the materials remain unpaid.

ASSAULT BY A BUILDER ON A SURVEYOR.—Mr. Wm. Stark, builder, Manor Park, was summoned at the Stratford Police court on Saturday, for assaulting William Henry Savage, the surveyor to the East Ham Local Board, at Little Ilford, on Oct. 26.—The complainant said the East Ham Local Board had recently issued some notices for the making-up of the First and Second Avenues at Little Ilford, where the defendant was conducting building operations. On Monday witness went to his office on business, and he and the defendant had a conversation about the width of the footpath and the drains. Defendant struck him violently on the head several times. James Newman, complainant's foreman, corroborated. The magistrates sentenced defendant to fourteen days with hard labour. Notice of appeal was given, and the sureties were fixed—defendant in £50, and two sureties of £25 each.

IN RE J. AND C. PAINE.—John W. Paine and Charles F. Paine, builders, in business at Stamford-hill, under the style of Paine Brothers, against whom a receiving order was made on the 2nd ult., have lodged a proposal for a scheme of settlement of their affairs. They suggest that their property shall vest in a trustee, by whom their business shall be carried on so far as to complete the buildings now in course of erection by them, and he shall, as soon as is practicable, realise the property, Mr. Charles Cleverly Paine, an unsecured creditor on the estate for a large amount, agreeing to withdraw his proof until the other creditors have received a dividend of 7s. 6d. in the pound upon their unsecured debts. The liabilities amount to £5,519, and the assets are estimated at £5,188, after payment of preferential debts; but the Official Receiver states that the actual realisable value is very uncertain. He, however, reports in favour of the proposed scheme.

IN RE JOSEPH SMITH, OF BRADFORD.—At the Bradford Bankruptcy Court, last week (before Mr. Registrar Lee), Mr. Joseph Smith, lately of the firm of Messrs. Smith, Gotthardt, and Co., land surveyors, Cheapside, Bradford, appeared for public examination. The report of the Official Receiver (Mr. J. A. Binns) stated that the bankrupt began business in 1847, and in his own business had always been successful. In 1873, he and some other persons formed themselves into a company to acquire land at Ilkley for resale as building sites. They erected the Middleton Hotel, but could not let it, and had to work it themselves. Land was also purchased at Burley. Mr. Smith had also had ventures in Bradford, and the greater portion of them remained in his hands at present under mortgages. Of Mr. Smith's joint speculators, some had died, and others became insolvent, and he had to assume their liabilities. His last partner, Mr. S. E. Maskell, left the country in July last, and Mr. Smith had to file his petition in bankruptcy. Mr. Smith, replying to questions, said, according to the original estimate, the Middleton hotel was to cost £12,510, but as a matter of fact it cost £35,916. The working of the hotel had been a loss to the company throughout the whole of its existence. He had also lost money in connection with the Cottage Club. That had been a very unfortunate business. Mr. George Smith was the architect, and people finding that the cost of houses was about double the original estimate, a number were thrown on the hands of the members of the club. He estimated his loss in connection with the club at £4,000. Many thousand pounds had also been lost in connection with the Villas Club at Addingham. Five were built. Another unfortunate matter which at one time promised well was the Silverwell waterworks, made at a cost of £1,516, of which, owing to the competition of the local authority, the rent had gone down to £40. In reference to the affairs of members of his family, he had been unfortunate. In the firm of Charles Smith and Co. he had lost £2,300; and he had also sunk money in the firm of Smith and Beanland. From the resources of his private business (which yielded about £2,000 a year) he had paid £4,000 to the Victoria Land Company. The examination was closed.

THE FALKIRK WATER ARBITRATION.—Counsel was heard before Mr. Gale, C.E., Glasgow, on Monday, at Edinburgh, in reference to the question at issue between the Falkirk and Larbert Water Trust and Messrs. D. Y. Stewart and Co., contractors. A difference has arisen between the parties as to whether the contractors have duly completed the works in terms of the contract, and the matter for discussion was whether there should be any inquiry before an arbiter; or whether, in consequence of a certificate granted by the engineer (Mr. Copeland, Glasgow), the Water Trust was not excluded from questioning the character of the work. The Solicitor-General and Mr. John Wilson appeared for the trustees; while Mr. Henry Aitken appeared for the contractors. The Solicitor-General having moved for a proof, Mr. Aitken submitted that the matter was not ripe for proof, the claim of the trustees, he contended, not being completely stated. He asked the specifically stated objections they had to the works. The Solicitor-General having amended the principal article of claim, time was granted for the lodging of answers.

CHIPS.

The new Infectious Diseases Hospital, Burton-on-Trent, is being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves with descending smoke flues, the same being supplied by Mr. E. H. Shorland, of Manchester.

"The Life and Letters of Sir James A. Picton," the well-known Liverpool architect, by his son, J. Allanson Picton, M.A., M.P., is about to be published.

A new organ, built at a cost of £600 by Messrs. Hele and Co., of Plymouth and Kensington, was opened on Thursday in last week in Emmanuel Church, Paddington.

On Saturday Mr. E. B. Hoare, M.P., laid the memorial-stone of a new aisle and chapel which is about to be added to the church of St. Mary the Virgin, Primrose-hill. The church was built 21 years ago from the designs of Mr. M. P. Manning. It is in the Early English style, and now seats 500; when the new aisle is added there will be room for 750 seats. The cost of the addition will be £2,000. A sculpture of the Annunciation has just been executed over the north door of the church by Mr. Samuel Fry.

The foundation stone was laid last week of a new R.C. church of the Sacred Heart in Burley-road, Leeds. The church and school building is two stories in height, the lower one being for schools. The upper story is the church, and is approached at the street level. It consists of a nave 50ft. by 25ft., sanctuary with apex 18ft. wide, and sacristy 22ft. by 15ft. The church is lighted throughout with traceried windows. It is to be erected of red brick with stone dressings. The roofs are boarded and panelled, octagonal in shape with curved principals. The roofs are covered externally with green Welsh slates. Messrs. Kelly and Birchall, of Leeds, are the architects, and Mr. Jones is the clerk of works.

WATER SUPPLY AND SANITARY MATTERS.

HEMSWORTH UNION WATER SUPPLY.—The rural sanitary authority of the Hemsworth Union are taking steps to procure a provisional order for acquiring lands and easements in connection with an extensive system of water supply. Nearly a year ago the authority instructed Mr. M. Paterson, M.Inst.C.E., Bradford, to report upon a scheme of supply in and for the township of Hemsworth only. A source absolutely trustworthy could not be found within the prescribed limits, and Mr. Paterson then recommended the consideration of the question of a complete scheme for the whole union. Instructions were given, and reports obtained, on schemes of supply from the Pontefract Corporation and the Penistone Local Board works respectively, the water in both cases being pumped from subterranean sources, and both somewhat hard, being from 11 to 12 degrees of hardness. After due deliberation, the authority have decided to adopt a scheme suggested by Mr. Paterson, the source selected by him being the joint water boards of Dewsbury and Heckmondwike. The water is of exceptionally fine, pure, and soft character from the moorlands lying on the Derbyshire boundary of the West Riding, above Penistone, and quite free from liability to lead poisoning. It is proposed to tap the board's conduit a few miles from the source, and the supply will be by gravitation, the works consisting of a line of pipes about fifteen miles long, a service reservoir at Ringstone Hill, 402ft. above sea level, and about 32 miles of distributing mains. The estimated cost is £28,000. The Hemsworth Union comprises 24 townships, of which eleven are included in the above scheme. This area is rapidly developing as a coalfield, containing the most valuable seams in Yorkshire, and its population has more than doubled since 1871, and, in consequence, existing water supplies, which are merely troughs and wells fed by surface springs, have become not only inadequate but in many cases dangerously polluted. The water is to be purchased in bulk, the maximum volume agreed upon being 400,000gals. daily, and the whole scheme is designed to meet the wants of a population of 25,000.

RUGELEY WATER SUPPLY.—At the meeting of the local board on Tuesday the question of the water supply of the town led to a long and very animated debate. The committee appointed to consider the question recommended that Mr. Radford be employed to carry out certain preliminary work, and prepare plans to submit to the Local Government Board. The chairman said that the recommendation of the committee was not unanimous, and he explained the reasons why Messrs. Fairley and Perry, who had been awarded the prize for the best scheme, had not been chosen to carry out the work, the principal reason being that Mr. Radford had had large experience, while Messrs. Fairley and Perry had never carried out a scheme of this kind. He proposed that the report be adopted. Mr. Lees moved an amendment that Messrs. Fairley and Perry be employed to carry out the work. Mr. Buttery said Messrs. Fairley and Perry had been anything but handsomely treated in respect to this matter, the board having some time ago accepted their scheme on the recommendation of the eminent geologist, Prof. Boyd Dawkins. Mr. Hebbs characterised the treatment of Messrs. Fairley and Perry as a gratuitous insult. On a vote being taken, Mr. Radford was appointed by ten votes to five.

STATUES, MEMORIALS, &c.

OXFORD CATHEDRAL.—A medallion with the head of the late Bishop Mackarness, of Oxford, has been placed in Christ Church Cathedral on the south wall of the south aisle, adjacent to the memorial of the late Prince Leopold. The medallion, which is of silver bronze, was designed by Mr. Leonard Stokes, the work being executed by Mr. Frampton. The late bishop's head, looking in profile towards the Communion-table, occupies the upper portion of the bronze, and in the space in front of the face is indicated the head of a crosier. Below is an inscription in raised lettering. The whole is surrounded by a square border of cherubs' heads in low undefined relief, the top line of which is broken by a shield bearing the arms of the see, marshalled with those of the family. This is surmounted by a bishop's mitre.

STAINED GLASS.

SANDRINGHAM CHURCH.—Among the numerous presents H.R.H. the Prince will receive on Monday next, are three stained-glass windows, one given by Her Majesty the Queen, one by Lords Gosford, Colville, Suffield, Sir D. M. Probyn, Sir C. C. Teesdale, Sir F. Knollys, Captain Stephenson, Gen. A. E. A. Ellis, Canon Dalton, Col. Stanley Clarke, Captain G. Holford, Rev. F. A. J. Hervey, and Mr. M. Holtzmann; and one by Mr. F. W. Gibbs, Q.C. These windows have been designed and executed by Heaton, Butler, and Bayne, under the supervision of Sir A. Blomfield and Sons.

Our Office Table.

AMONG the minor exhibitions now open to the public, we may draw attention to a series of water-colour drawings illustrative of the streets and buildings of London, from the pencil of Mr. C. J. Lander, who, with a lively sense of colour, has managed to impart a picturesque character to what, as ordinarily seen, wears, at any rate, a more sombre dress, and melts into the unobserved and commonplace amidst the medley of monotony in our modern streets. Ludgate-hill has often been well represented, and here Mr. Lander treats this unquestionably picturesque thoroughfare with breadth and with a sense for detail, even if we descend to the young lady in grey who is mounting on to the top of an omnibus under the railway bridge. The west front of Westminster Abbey has the towers too tall, and that of St. Margaret's is also too elongated. Kew Bridge is well drawn, and the Royal Exchange, as a contrast to it, may also be named. In the same Burlington gallery in Old Bond-street are also a series of "Facts and Fancies," by Mr. Reginald Jones, whose water-colours are very bold and broad in style, sometimes bright in colouring, but more successful in the quiet tones of greys and yellows. These landscapes will alone repay a visit.

A COURSE of twelve lectures on "Architecture as Demonstrating the Manners and Customs of Nations" is about to be given at Hampton Court Palace by Mr. T. Locke Worthington, A.R.I.B.A., who is one of the professional lecturers of the London Society for the Extension of University Teaching. The series will be fully illustrated, and will include a review of both the true and imitative styles. The first of the course will be delivered this (Friday) afternoon at 2.30.

THE London County Council decided on Tuesday to invite applications for the posts of chief officer of the Fire Brigade, at a salary of £800 a-year with free quarters, and for a superintendent of parks and open spaces, at a salary of £700 a-year. It was also decided to accept the tender of Messrs. Pearson and Son for the construction of a 16ft. wide tunnel at Blackwall for £871,000. Sir T. Farrer announced that he had received a communication from Lord Salisbury, stating that the Government had the subject of the water supply of the Metropolis under their serious consideration.

AT Tuesday's meeting of the City Commission of Sewers, Colonel Haywood, C.E., the engineer, reported that the artesian well at the Artisans' Dwellings in the Minories had been bored to an additional depth of 100ft., making 450ft. in all, the average daily yield being 50,000 gallons. He recommended that the boring should be continued for another 100ft. deep, at a cost of 30s. per foot. After a discussion the recommendation was carried, and it was further arranged that Dr. Sedgwick Saunders, the medical officer, should analyse the water and make a report as to the result at the next meeting. The Court, under the provisions of the Sky Signs Act, which came into operation on June 3 last, sanctioned certain existing signs, the security of which had been certified by the district surveyor, and issued licenses in respect of them. Other signs were either condemned or their consideration postponed until the surveyor was satisfied as to their safety.

ALTHOUGH the large quantity of timber still growing on Canadian soil tends to check interest in forest preservation and extension, the Federal Government has recognised the need of such efforts, and has for some years been testing many varieties of tree life at its experimental farms. At the Central Farm, near Ottawa, the seeds of Rocky Mountain and European conifers were liberally sown. This year 175,000 seedlings were transplanted from these beds, to be distributed later on to the branch farms and private experimenters, who will send in careful returns of progress. This year, too, the Government has distributed 100,000 forest-tree seedlings among 1,000 applicants in the North-West, with instructions for planting and future treatment. Twenty-five "gardens" along the main line of the Canadian Pacific Railway have also been supplied from the experimental farms. The urgent need of forestry even in the old provinces, not long ago covered with trees, is illustrated by Mr. J. C. Chapais, an authority on such subjects. "I know whole regions," he says, "which were cleared by settlers, who had desert the land soon after because it was w nothing. Such districts would have bee many inexhaustible wood-reserves for fu generations, who, for an almost endless pe of time, would find on them all the wood want. To-day these same districts are q useless in every respect."

MEETINGS FOR THE ENSUING WE

MONDAY.—Surveyors' Institution. Address by the sident, R. C. Driver. 8 p.m.

TUESDAY.—Society of Architects. Members' dinn the Holborn Restaurant. 7.30 p.m.
Institution of Civil Engineers. dress by the President, G. Berkley. 8
Sheffield Society of Architects Surveyors. "Architectural Educati Sheffield."
Royal Society of Antiquarians of land. Meeting in Dublin.

WEDNESDAY.—Society of Architects. Opening ad by the President, W. H. Seth Smith. James's Hall, Piccadilly. 3 p.m.
versazione at Princes's Hall. 9 p.m.

FRIDAY.—Architectural Association. "Frame Hous by C. H. Brodie. 7.30 p.m.

The Architectural Association, 9, Con street, W., and 56, Great Marlborough-street, W.

The Architectural Association Courses of Lectures Classes and Studio Instruction are now being carrie The Courses are both elementary and advanced, an designed to provide a sound professional architec education, supplementary to that to be obtained b prevailing system of pupilage. The Courses also as a means of preparation for the Intermediate Final Examinations of the Royal Institute of Br Architects. The Course, which is divided into years, is progressive and consecutive, and the instru is given by Lecturers and Instructors of known abili

FIRST YEAR.

LECTURES AND CLASSES.—The orders of Greek and R Architecture, Building Materials, Geometry, Physics, Perspe Mensuration, Chemistry, Geology.

THE STUDIO.—Drawings from ancient examples, Freehand ing, Drawing examples of Construction, Plane Geometr Perspective, Sketching and Measuring.

SECOND YEAR.

LECTURES AND CLASSES.—English Architecture, Prin of Construction, Strengths of Materials, Land Surveying, Che of Building Materials, Elementary Ornament and Colour D tion.

THE STUDIO.—Designs based upon ancient examples, Free Drawing, Drawings of Elementary Construction, Solid Geo Sketching and Measuring.

THIRD YEAR.

LECTURES AND CLASSES.—The History of Archite Materials, Stresses and Strains, Specifications and Quantity S ing, Ornament and Colour Decoration, Sanitary Science, Eleme Natural Philosophy.

THE STUDIO.—Design of modern Buildings, Freehand Dr from Casts, Perspective and Sciography, Constructive Ma Modelling, Elementary Water-Colour Drawing.

FOURTH YEAR.

LECTURES AND CLASSES.—The History of Archite Materials, Sanitary Science, Measurement and Valuation of ing Materials, Professional Practice, The Arts Allied to tecture.

THE STUDIO.—Design of Modern Buildings, Freehand Dr from Casts, Graphic Statics and Perspective, Modelling, Colour Drawing.

A pamphlet containing full particulars of the Curric and Fees may be obtained free on application to Hon. Secretaries, at 56, Great Marlborough-st London, W.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXI.—No. 1923.

FRIDAY, NOVEMBER 13, 1891.

THE EMPLOYMENT OF BUILDERS AS ARCHITECTS.

THAT domestic architecture is largely being relegated to builders is one of the notes of lament we every now and again hear from prominent members of the profession. The late Sir Gilbert Scott, in one of his later Institute addresses, gave expression to his abhorrence of the growth of "mushroom" dwellings which were being erected in utter defiance of architectural taste; the late Mr. Street also regretted the fact. This time the President of the same body, in opening the new session, again drew attention to the "thousands of houses erected yearly in the Metropolis, the vast majority of which are not designed by architects, but by clerks and employés of speculating builders." That the representative spokesmen of a professional body should thus refer to this discouraging fact is not surprising, seeing that houses constitute by far the larger proportion of the average architect's work. The most galling thing about it is this, that to the profession are attributed not only the destruction and spoliation of many of our most beautiful estates, by disfigurements of a structural kind, but the bad construction and insanitary condition of dwellings in the suburbs. This attribution of the incompetence and ignorance of builders' employés to architects is, of course, a great injustice to the profession, and must materially prejudice it in the eyes of the public, who do not care to inquire whether an architect or a builder's draughtsman designed such and such a house. Well may the wrathful indignation of the President be aroused at this addition of injury to insult. The profession have enough to bear in the performance of their duties without being taken to task for the deficiencies and want of knowledge of pretenders.

But we may be allowed to ask whether there are not some explanations of this apparent want of appreciation of the architect's work, and why those who tenant or take leases of houses are content with the buildings they find erected. The truth is that, owing to the system of leasehold tenure, the speculative builder is first in the field; he acquires the estate, he builds the houses under the very cursory examination of the leaseholder's surveyor, and, if he can help it, he tries to keep out of the estate the architect, for whom he has a great dislike, for reasons well known to himself. The architect, in fact, has very little chance of obtaining a foothold on an estate of this kind. Many of our large suburban estates have been covered with houses built without the aid of an architect, from plans, in fact, supplied by the builder. Sometimes, it is true, an architect prepares the designs for the builder, but he has no further interest in the matter, and has nothing to do with details or supervision, and is therefore irresponsible for results. The exceptions to this state of things constitute the rule. Those who have higher view of the possibilities of an estate, and believe that the erection of artistic houses is desirable, even on commercial grounds, let the plots on more favourable terms, and sometimes insert a clause in the building agreement that the houses must be designed by architects. A landowner who really desires to improve his estate makes a stipulation that the houses must be built to his architect's satisfaction, or that each lessee should employ his own architect. But the ordinary plan of letting the land to the builder on building leases, reserving a ground rent and allowing the builder to sublet, is subversive of good construction, and the effect is to keep the architect out of the estate. Can we wonder that so huge a proportion of houses are erected from builders' designs? We should be sorry to see architects enter into building transactions with owners of land, or become speculators, and we can hardly think the alternative would be, in many cases, better than the present state of things. We know a few estates where an architect, or firm, has made an agreement for building leases; but the result of the arrangement, from an architectural point of view, has not been satisfactory. The "financial" gets the better of the artistic, and there is too much replication, or, contrariwise, affectation of variety of detail, to be agreeable.

How the architect can be legitimately employed to take his place in the erection of buildings on estates without becoming a professional speculator is the question. Owners of large estates are to blame for this wholesale sacrifice of land to the mere maker of "improved" rents. But they, too, are led by existing requirements. They find that those who want houses or who have money to invest are more numerous than those who wish to build according to their own tastes; they find also that the large speculator who agrees to cover the land is a more profitable customer than individuals who bring their own architects. The larger proportion of people take leases, and are content to occupy the builder's house till they discover its inherent defects. If those who grant new leases followed the example of the Duke of Westminster in making it a stipulation in their agreements that architects must be employed, some improvement might be effected.

Another reason for the non-employment of the professional man is the popular idea that an architect is an expensive luxury that can be avoided. To some extent the idea is confirmed by excessive estimates, extras, and expenses; but the impression is based on wrong data. People who think thus do not appear to consider the fact that cheapness in building is invariably the result of inferior workmanship, and that the so-called extra expense is, in the long run, the wisest policy, and has added to the quality and excellence of the building. But it is a difficult thing to shake a popular prejudice, and so it is the builder's design is often accepted before that of the architect. The natural craving for novelty, as the President of the Institute mentioned, is, no doubt, one of the weak points of modern architecture; fitness and beauty are often sacrificed to it. Architects, no doubt, pander to novelty; there is a too frequent craving for something new and striking, which has often been detrimental to the art they profess. The builder's plan is, at least, practical; he manages to cater for the popular taste in house building, tesselated tiling, fashionable grates, mantelpieces, and furniture. The requirements of the culinary department, of bath-room, lavatory, and other fittings are provided of a quality which seems to challenge any doubt as to their efficiency. The speculative builder has learned to know what the average tenant looks for, and he accordingly provides all that is essential to the convenience and tastes of the inmates without troubling himself about their quality. Again, he knows the uncertainty of being too inventive or experimental; therefore he adheres to a type of plan and accommodation that has been found to give satisfaction and to be perfectly safe, even although the aspects of the rooms are ignored. In these points, at least, the builder's design competes favourably with the architect's, whose plan is a little irregular and wanting in compactness. The practical builder's method may even teach the architect something. The complaint of the profession may even provoke some retorts of a kind that will not be relished; one of these will be the fees of the architect, another his disregard of matters upon which the comfort of every house depends. Clerks to builders can undertake to make a set of designs to suit the client, the cost of which will be included in the estimate. The profession, of course, cannot compete with services of this kind, but they may retrieve their position in other ways by proving that their training and qualifications are really of value to the public who seek their services in practical no less than in artistic matters. The question, Why are architects so little employed in domestic buildings? is worthy of deeper consideration to the profession than we have ventured to suggest, and much of the indifference is attributable to the utilitarianism of the age.

CONSOLIDATION OF THE BUILDING ACTS.

THE introduction of a consolidated and amended Building Act for the Metropolis will be of vast importance to the people and architecture of London. Between a rigid enforcement of rule and a number of enactments that are constantly evaded, the necessary conditions of sanitary construction and architectural design are lost sight of. Absolute ugliness and monstrosities are tolerated on one hand, and sanitary requirements and good construction successfully ignored by the unscrupulous builder on the other. Imperfect machinery has rendered these failures possible; but an Act which applies indiscriminately to all buildings; which does not take into consideration the requirements of architectural improvements in our streets; that allows of no relaxation of certain rules under exceptional conditions, must necessarily fail to secure the objects to be kept in view. At present buildings of very different kinds come within the jurisdiction of the law. Architects naturally complain of the restrictions imposed upon them in various ways in towns. The observance of angles for light to "ancient windows" is one of increasing perplexity in rebuilding in old, or re-modelled, thoroughfares, and, though the Building Act does not take into account the circumstances of light and air, some provisions appear to be necessary in respect of it. It might, for example, prescribe a certain angle of building for erections adjoining to, or in proximity with, old windows on certain levels, so that subsequent litigation and costs might be saved. An architect finds that he has to comply with different rules under various Acts; some of these are rigidly enforced, others are loosely interpreted. Existing laws do not take account of degrees of obligation. That is, while one class of buildings for domestic and trade purposes come off lightly, those intended for public uses are heavily handicapped.

It would be undesirable to restrict by statute the design of buildings in our streets, and the difficulty is certainly to define some limits to the operation of a Building Act that will afford every protection to the public interests and to health without restricting or fettering architectural invention. These limits are somewhat hard to set. For example, there are elements of safety and habitability which come in a very direct manner within the scope of a Building Act, which yet would appear to encroach on the architect's domain. We will instance two—projection beyond line of frontage, and height. Each of these very closely come within the operation of a sanitary law. The public have suffered, and are now suffering from the encroachment of new buildings beyond the "general building line,"

and it is certainly within the scope of an Act to regulate building frontages, for every man, woman, and child has an interest in the preservation of a certain width of roadway or street. But the rule no less interferes with design. A general frontage line practically curtails the architect's liberty, because it compels him to make a flat front, or to reduce to a minimum every architectural projection, so that the design loses a great deal of effect. To produce a pleasing play of light and shadow, or to emphasise any feature, entails a setting-back of some portion of the façade, and, consequently, a loss of space. We might mention several buildings in our City and West-end streets which painfully illustrate the flatness occasioned by the operation of section 75. Hence the practical effect of this very salutary law is to deprive the architect of one source of effect in the design of façades. To make any distinction between private and commercial buildings and public edifices would, perhaps, hardly meet with general approval; but we cannot see why, in interpreting this provision of the Act, public buildings should not be a little favoured. We know there are certain exempted buildings under the Metropolitan Building Act. The discretionary powers given to the County Council and vestries may, we think, in this direction be exercised more fully without making any invidious distinction. A vestry hall, a free library, or museum, a technical school or a church, are buildings of this exceptional class, for either of which a freer interpretation of the section to which we refer might be allowed. These buildings only constitute a very small proportion of the private and commercial buildings of a town or district, and by exempting them from the operation of a by-law of this sort, the architectural design of important edifices would not be interfered with. The other limit, as to height, is another matter about which the building authorities of towns may exercise a little discretion. It does not seem fair that a block of dwellings in flats should be carried to a great height in a street where houses or shops of two or three stories exist. The disproportion between a block of, say, eight or ten stories and a row of small houses, completely destroys all sense of architectural propriety or dignity, and here it seems at least to be a reasonable thing for a local authority to exercise a little control by preventing lofty buildings being erected in proximity to those of only ordinary height. Yet the building by-laws do not exercise any such discretion. We lately referred to a few recent structures built along the Victoria Embankment, which seemed by their great height to overpower the older buildings in their neighbourhood; but these occupy an exceptional situation: they face a wide embankment and river, and therefore their great elevation is perhaps less objectionable than others which are placed in a line with smaller houses in a street. A more flagrant instance of excessive height is that to which Mr. J. MacVicar Anderson referred in his opening address at the Institute. He cited the newly-erected additions to King's College at the eastern end of Somerset House (river front) as one instance of "selfishness" in architecture, and he was quite justified in drawing the attention of architects to the incongruity of design of the addition with the beautiful river front of Chambers's great work. Nothing on the Embankment has spoiled the skyline more than this hideous building, which rises above the line of existing roofs, and appears to "jar" upon the eye as it takes in the grand length of the river façade. But there is no control. The modern Metropolitan ædile does not exist as he did under the Roman Emperors; buildings of any height have been allowed to be erected, however ugly. Legislation ought to prescribe some more satisfactory rule, such, for instance, that height above a certain limit should be confined to architectural features only, such as pavilion roofs, domes, spires, and that these designs should be submitted to a committee of architects and artists whenever old buildings are raised or new ones erected in our main thoroughfares in proximity to existing buildings. The statutory limit of 90ft., as Mr. Anderson said, is excessive; it is true the London County Council have powers; but in practice the full limit is taken advantage of, and is likely to be exceeded in some cases by permission of the authorities. In course of time, everybody who wants to build in the Metropolis will take advantage of the full height of 90ft., and we shall have huge blocks of business premises and hotels rising in all directions, and, so far as we can see, the Council will be powerless to make any modification or reservation. In this manner, a statutory height is likely to create a disastrous effect on our streets; the public interest and health must suffer if lofty buildings are allowed to be erected, overshadowing smaller ones. Still, for all that, a limit of height is better than none. What is demanded, is a discretionary tribunal, to decide whether a building of great elevation would be prejudicial or not in a certain situation, which tribunal would consider both the hygienic and the architectural grounds for rejecting or permitting a certain building to be erected on a given site. A committee intrusted with such a question should consider the width of street, the kind of buildings adjoining the proposed erection, the architectural surroundings and sky line. The same discretionary power should be exercised in deciding on other points such as projection and other questions which have to be determined in respect of new buildings under the Act. Any successful building legislation ought necessarily to be able to draw a line between sanitary and constructive requirements, and those of an architectural kind.

Public edifices and architectural designs appear certainly to demand a separate treatment at the hands of the authorities, and it is in this direction that the London Building Law (Consolidation) Bill, proposed to be introduced by the Local Goverment Board next session, might do something. Consolidation is urgently called for. We can imagine what a labour it would be to unravel all the intricate meanings of statutes and sections of the Metropolitan Building Acts and the sections of the London Council (General Powers) Act of 1890. The additions of various statutes to the old Act of 1855 have made it no easy matter to interpret what the present state of the law is respecting any given subject. For instance, the by-laws and regulations as to projections and lines of frontage have to be sought for in different parts of the Act and its amendments. The formation of new streets, areas for light and air in front and rear, and regulations respecting theatres and buildings of public resort, are questions that now have to be discovered by reference to many sections conflicting or puzzling. All this means a great deal of labour that might be dispensed with if the provisions were amalgamated or recast.

The result of the present piecemeal legislation has been to give a monopoly of practice to the builder who has mastered the weak points of the statutes, and knows in what directions he may evade certain clauses of the Act. The London Council (General Powers) Act will make it more difficult for him, however, to pursue his malpractices. In foundations and drainage, underground rooms, the ingredients of mortar and plastering, and in sanitary details, we may expect some improvement. Yet the proposed amendments are still imperfect when we compare the provisions with those of the new by-laws in operation in many large towns, as those of Manchester and Sheffiel In London, interior construction of th ordinary domestic dwellings is seriously de fective. All sense of security is absent direct we enter the threshold. For the protectio of a community we require every building be interiorly non-inflammable, sanitarily pe fect, and sound in construction. Our by laws provide only imperfectly for these thr conditions. They insure fire-resisting walls but leave the floors and partitions to th conscience of the builder. Provisions f drainage are made; but the exclusion gases and moisture from the foundations a basement is not attempted. Walls of certa thickness and materials are scheduled; bu divisions internally may be of flimsy co struction, and staircases and buildings left the dictates of commercial convenience, as the case of the conversion of private in trade premises. The Public Health A model by-laws in operation in Manchest and other towns provide scantlings of timbe of a minimum size, and specify other requir ments, which leave a long way behind t present patchwork legislation which is operation in the Metropolis. Recent refor have been made, it is true, with the object assimilating, as far as possible, the Buildi Act of the Metropolis with the Public Heal Act in operation in other towns; but a attempt short of general reconstruction of t old statutes will be futile.

HOT-WATER ENGINEERING.—XXII.

Supply of Hot Water for Baths and Domestic Purposes.

estimating and conclusion.

THE subject of this paper enters very larg into all hot-water works, for in but ve few instances indeed are orders for these und takings given without the estimated cost be first ascertained and agreed upon. This not o applies to large, but also to small works, and a when an existing apparatus is extended or alte in any way. It is a tolerably simple matter calculate the quantity of tube and fittings quired. Examination and measurement asc tains this. Where the particular skill, or rath practice, is required is in fixing upon the ti that the men will be occupied from the commen ment to the entire completion of the apparatus

This is governed by several things—first particularly, the nature of the works. In t actual skill is needed to decide how much lab will be needed. Very commonly a small appara will cost as much as a large one, owing to many times the pipes have to deviate fro straight line. Pipes that all run straight wi out turns (which either require the pipe to be for a bend or elbow to be inserted, or have to heated and "set") cost the least, and th again, we may take it as a rule that a numbe angles generally signifies a want of room to w in, and when men are cramped for space which to use their tools freely increased time occupied in the work.

The size of pipe makes a very great differe in the time of labour, as well as in cost of mater Cutting and screwing 1¼in. pipe occupies, roug speaking, twice the time the same work on ¾in. wo do, and, say, half as long again as if it were A material difference in time is created by character of the fitter in charge of the work. two men are alike. The writer has kn instances where one man would be doubly as as another, yet both were skilled. The fast is generally a quick thinker (many fast work are careless, and turn out indifferent work: not this class of man that is referred to), and a happy knack of working straight away wit a hitch, and he can keep his labourer forw with his share of the work without an effort that the two men's work meet and agree in ev way.

The other (unless lazy) keeps just as stea at work, but either fear or a naturally partic habit makes him painfully careful in his w and the result is much greater time occup but with the class of man the writer refer the apparatus is afterwards a pleasure to be —exact and true in every detail. As a differe between men always exists (though not to

arked extent as this), it is generally arranged the rapid man to take estimate works of an nary character, and the slow-and-sure man ke time jobs. Of course, it is only good- l firms that have sufficient work for the latter of man; few firms can employ many such, ss they can afford to ignore competition.

Works have to be divided into those that are in town where the engineer's business is, and e that are in the country. Town is generally idered to be a 12 or 15 mile circle round the quarters, although it generally pays to make untry job of any that requires 1s. or 1s. 3d. be spent every day upon each man in elling expenses. Country money or allow- varies from 1s. to 1s. 6d. per day to cover ings and extra cost of food, for the workman not take his daily meals with him from home, the usual custom in town jobs. When a costs 1s. for travelling each day, it comes per to let the man lodge near the job, as, in tion to the fares, his time travelling both to fro has to be paid, and this may be an hour way.

he other things to be considered in a country are, firstly, the time going to and returning the place. If it be in Cornwall, Scotland, on the Continent, it is unnecessary to point that at least ten or twelve hours must be wed for travelling only, each way; and then an ra time if the house be a distance from the ion. In addition to this, an hour or two is n consumed in securing lodgings, and these not be obtainable near the works, so that a k is necessary each way every day (country ks are full of contingencies).

he majority of country residences that are e enough to need these works are generally a d distance from a railway station. This needs sideration, as it may be too far for the men walk, particularly if loaded with tools (these s are a heavy load). Then, again, the ing, cylinder, and other heavy goods have to ransported from the goods depot. It must be remembered that the carriage has to be d on these goods, or should any be purchased neighbouring town, they will be found more ensive, unless the town in question is supplied the manufacturers direct.

t is usually a foreman's duty to inspect works estimates, and should the work be at all ensive, he may require a clerk with him. In case the expenses entailed in furnishing the mate should be included in the cost. Then if order is secured, it becomes necessary for the e man to go down and start the men, and he y have to visit them afterwards, depending n what reliability can be placed in the fitter, the chief fitter, if there be more than one. ese journeys must be included.

There is no doubt that different firms have erent ways of preparing the cost of works, the following is the method adopted by some, ich although open to criticism, gives good ults. It is not intended to recommend this thod to the exclusion of others, as doubtless ter systems are to be met with; but it shows rly what work has to be done, it gives no portunity for a draw off or other service to be rlooked, it is difficult to miss even a few ings, then afterwards it is a good reference en the goods have to be booked out or ordered. putting the name of the service in the margin implifies the writing of the specification. To best of the writer's belief, no system exists arriving at cost by calculating at so much per t run. It does not seem possible, as the actual our and time involved may be three times as ch in one case as in another. If there is such system at all practicable the writer would very urally like to hear of it.

If a range and boiler, or independent boiler, is uired, this should be noted down in the esti- te book, with its price and general particulars, o details as to the fixing either of these. With former there may be brickwork needed, or eration to the chimney opening and mantel- ce. With the latter some smoke-pipe will be eded; and if the floor be wood, a non-in- mmable base for the boiler to stand upon must provided. It is necessary to put all these ngs down, as an estimate may not be accepted some time after it is given, and the memory uld not then be relied upon, if estimate giving uld be of daily occurrence. The range or ler is not usually included in the price for the t-water apparatus; it is shown separately, not ly in the estimate-cost book, but on the esti- mate itself. Many people show the price of the cylinder or tank separate from the pipe work also.

ESTIMATED COST (IN DETAIL) OF A MEDIUM-SIZED APPARATUS FOR A PRIVATE RESIDENCE.

	£.	s.	d.
Reservoir.—1 50-gal. cylinder, ⅛-plate (rough sketch with position of flanges)	3	15	0
1st Flow and Return.—12ft. of 1¼in. steam tube, 7s.; 4 connectors, 2s. 10d.	0	9	10
8 backnuts, 2s. 4d.; 2 (perhaps 4) bends, 1s. 10d.	0	4	2
2nd Flow.—8 ft. of 1in. tube, 30s.; 4 connectors and nuts, 3s.	1	13	0
6 bends	0	4	0
2nd Return.—60ft. of ¾in. tube, 16s. 6d.; 2 connectors and nuts, 1s. 3d.; 4 bends, 2s.; 1 1in. by ¾in. tee, 8d.	1	0	5
Cold supply.—80ft. 1in lead pipe, 37s 6d., 2 1in unions, 4s.; 1 1in. stop-cock, 8s. 6d. (full way)	1	17	6
Emptying service.—1 1¼in. by ¾in., 1s.; 3ft. ¾in. tube, 10d.	0	12	6
1 elbow, 6d.; 1 cock, 4s	0	1	10
Scullery sink.—1 1in. by ¾in. tee, 8d.; 26ft. ¾in. tube, 7s. 1d.; 3 e'bows, 1s. 6d.	0	4	6
1 connector and nut, 8d.; 1 cock, 5s. 6d.	0	9	3
Bath.—1 1in. equal tee, 8d.; 10ft. 1in. tube 3s. 9d.	0	6	2
2 1in. elbows, 1s. 3d.; 1 1in. connector and nut, 9d.	0	4	5
1 iron and lead union, 2s.; 3ft. 1in. lead pipe, 1s. 8d., connect to bath fittings	0	2	0
Housemaid's sink.—1 1in. by ¾in. tee, 8d.; 12ft. ¾in. tube, 3s 3d.	0	2	0
4 ¾in. elbows, 2s.; 1 ¾in. connector and nut, 8d.	0	3	11
1 cock, 5s. 6d.	0	2	8
Lavatory basin.—1 1in. by ¾in. tee, 8d.; 8ft. ¾in. tube, 1s. 8d.	0	5	6
3 ¾in. elbows, 1s 1d; 1 ¾in. connector and nut, 6d.	0	2	4
1 ¾in. iron and lead union, 1s. 3d., 3ft. ¾in. lead pipe, 9d., connect to lavatory fittings	0	1	7
Sundries (including mortar, cement, and plaster for making good brick and cement-work cut away), carriage of fittings, red and white lead, hemp, paint, solder, and other such small items, use of tools, supports for cylinder, pipe-hooks, hire of forge, and contingencies that cannot be foreseen, say	0	1	3
	0	0	9
	2	10	0
Fitter and assistant's time (if no range be fixed) say, 100 hours at 8d. and 5d.	5	8	4
Daily rail or bus fares, say	0	12	0
Foreman's first journey to inspect, and say two subsequent visits	0	16	0
	£21	12	7
Add profit			
	£		

The above, as will be seen, is the suggested cost of some works within a short rail journey of shop or works. If it should be a country job in contemplation, then the following must be considered:—Greater railway fares, possible travelling expenses from the railway station to customer's residence, and the same in returning; time occupied in the whole journey to and fro, and securing lodgings; greater expense in foreman's first journey for particulars, and subsequent visits; country expenses (lodgings, &c.); conveyance of goods by rail, and possibly by road. Sometimes a heavy "kit" of tools causes an excess fare to be charged when taken with the workmen.

Building materials, if required, are often difficult to get, and then only at some distance, which necessitates cart hire. This, however, might be included in the sundries. Sundry and contingent expenses are usually a little heavier on country jobs. If the men travel a distance sufficient to extend into and through the night, they generally expect to be paid not only their time, but at overtime rate for the night hours. This occurs when going to Scotland (some parts), Ireland, or the Continent.

Very commonly on country jobs, the customer prefers to find a local labourer to assist the fitter (if the job be small), this being done to save travelling time and expenses, and the lodgings, &c. This can be allowed sometimes; but it is rarely economical. A fitter, with a strange labourer, gets through his work but slowly. His own labourer would be accustomed to his work, and the two men's labour then fit together, so to speak, and more rapid results ensue.

As a rule, there are various conveyances at large country residences, and the customer will then undertake cartage of materials, men, &c., from and to the railway station. The customer may also provide what building materials are needed, if the estate has its own bricklayer, or odd man, who would have these things by him. This saves a deal of trouble and loss of time, as well as the expense.

When estimating to builders, or for new buildings, it is commonly arranged for everything in the way of brick, wood, cement, and decorating work to be omitted from the estimate, as a tradesman knows that a hot-water fitter cannot deal with these materials in the way a bricklayer or plasterer can.

When preparing estimated costs of work, it must be remembered that everything likely to happen must be allowed for. There are occasionally little troubles to be expected, but which may or may not transpire. The estimate must calculate upon their happening. If they do not, then so much the better. It frequently happens that in making provision of this sort, and the expected troubles do not occur, a greater than usual profit is made. Sometimes so much so that the customer would have better off if the work had been done by time charge. It is not always the client that insists upon an estimate that pays the least, by any means.

This concludes the writer's articles upon hot water, and it has merely to be pointed out that works of this description ought never to be done in a slipshod manner. There is much greater scope for a display of skill in this branch of engineering than is commonly supposed. A perfect apparatus even at this moment is not met with everywhere, by any means.

[The writer of these articles is Mr. F. Dye, of 176, Regent-street, London.]

THE SOCIETY OF ARCHITECTS.

THE members' dinner of the Society of Architects was held on Tuesday evening at the Holborn Restaurant. The President, Mr. W. Howard Seth-Smith, occupied the chair, and was supported, among others, by Mr. W. N. Colam, President of the Society of Engineers; Sir James D. Linton, President of the Royal Institute of Painters in Water-Colours; Mr. Wyke Bayliss, President of the Royal Society of British Artists; Mr. Henry Clarke, Chairman of the Improvement Committee of the London County Council; Mr. Robert Walker, past-president, and Mr. Geo. S. Bridgman, vice-president.

Mr. T. W. Connon, F.R.I.B.A., proposed "The Architects' Registration Bill Committee." He observed that he was under the painful necessity of controverting the observations made a few days ago by Mr. J. M'Vicar Anderson President of the Royal Institute of British Architects. It was certainly not true, as Mr. Anderson had stated, that the advocates of Registration admitted that it would be accompanied by disadvantages. The object of the Society of Architects was to be sure that every man who aspired to the position of an architect should prove that he had received the necessary technical instruction to fulfil the office he professed to perform. They were quite willing to admit that the Royal Institute of Architects, who were in opposition to them, were strictly within their rights; but he trusted that, although they had been working seven years to prove they were in the right path, they had no cause to despair of the ultimate result. The adoption of an Act of Registration would surely remove the difficulties under which they laboured in their profession, and he believed the time was not far distant when their object would be achieved.—Mr. Robert Walker, responded.—Mr. Ernest Day, F.R.I.B.A., proposed "The Fine Arts," and Sir James D. Linton, in reply, spoke hopefully of the recognition by Government of the claims of British artists.—Other toasts followed, and an exceedingly pleasant evening was spent.

An ordinary meeting of the Society was held on Wednesday afternoon at St. James's Hall, Piccadilly, W., the President, Mr. W. H. Seth-Smith, F.S.I., occupying the chair. The adoption of the annual report, which was summarised in our last issue, was moved by Mr. Robert Walker, of Cork, past-president, seconded by Mr. Ernest Day, of Worcester, and carried unanimously. The balance-sheet was also adopted, on the motion of Mr. W. Allport, hon. auditor, seconded by Mr. E. Tidman, treasurer. The following four new members were elected:—Henry John Bridgewater, A.M.I.C.E., of Ingfield, Marsden, Huddersfield; Frederick George Grierson, 9, Old Jewry Chambers, Cheapside, E.C.; Edward Beckitt Limb, 44, Great Russell-street, W.C., and Mount Zion, Tunbridge Wells; and James Wilson Leslie Simmons, P.O. Box 156, Pretoria, S.A.R. The president announced that a number of donations of architectural works and pamphlets, chiefly French and Belgian, had been made to the library. The Canon Guillaume van Casta, of Malines, an honorary member, had also been so good as to present the library with a copy of some hundreds of drawings

and patterns of lead-lights, which he had made in Belgium and France, and this would be found of great value for purposes of study.

The PRESIDENT then delivered

THE OPENING ADDRESS OF THE SESSION.

In his introductory remarks the President congratulated the Society on its good position. It seems to me, he observed, that your society is stronger than it was at the commencement of last session. The average quality of the papers read was far better than in any other previous year, the meetings were better attended, while there has been no diminution in numbers applying for membership, and the elections have been well sustained, notwithstanding the vigilant efforts of the council to exclude all who are not *bonâ fide* and well-qualified architects. The excursion to Belgium was in every sense a successful enterprise; full of profit to us as architects. But besides the usual work such a society as ours performs for the mutual advantage of its own members, the Society of Architects has devoted its energies to the interests of the entire profession and to those of the community at large in promoting the Registration movement. This is the great idea inspiring us at the present time—an idea which, when realised, will, we believe, not merely reform the profession, but give an immense impetus to, the art of architecture; and if all other reasons were lacking, this is alone a sufficient one for your existence as a society, and for the sympathy, support, and adhesion of all architects who agree that such a measure is necessary. It is a happy coincidence that at the very commencement of our session I am able to announce that after years of animated, and occasionally acrimonious, discussion, the architects of the great colony of Victoria have agreed that it is necessary in future to prevent any but properly trained men from styling themselves architects, and have drafted a Bill which (presented, as it is to be, to the Legislative Assembly with the unanimous support of the colonial profession) is, I presume, pretty sure to become law within the next year. The text of this Bill was published in the BUILDING NEWS of Oct. 23 last, and, by comparing it with the Bill which our own Registration Act Committee drew up with so much care, and which is still before the Imperial Parliament, you will notice that its provisions very closely follow those of the English measure. The President proceeded to quote from Prof. Aitchison's recent communication to the Architectural Association, in which it was remarked: "It is only by putting architecture on a constructive basis that we can hope to succeed . . . . All the architect can do after the plan or general scheme is settled, is to shape, to mould, and to pierce the various parts, and he may call in the sculptor and the painter to enrich important parts with carving and colour . . . . What we want is easily said: daring construction, fitness for the purpose both material and mental, and mostly with the necessary dignity, simplicity, and grace; but to do this requires extraordinary ability, the hardest study of many dissimiliar subjects, and ceaseless effort." We, who have had some experience of practice, the President continued, know how weighty and true these words are, and, therefore, protest against the assumption of the title of architect by any persons who have not devoted years of arduous study to the subject. The observations about the disastrous result of architecture falling into the hands of scholars, goldsmiths, painters, and sculptors in the Italian Renaissance period are in curious contrast to the petition sent to the Royal Institute of British Architects last spring from about fifty architects, protesting against all examinations, even such as their own body, the Institute, has established, which is designed to be no more than a test of a qualifying education. Surely the dual nature (scientific and artistic) of architecture constitutes it the most god-like of the arts; can we imagine that the joy experienced by the Architect of Nature is confined to the beautiful forms and colours with which He has dressed physical creation? And no architect can ever feel the highest delight which his art is capable of affording until he has designed and created on the same eternal principles. These exalted emotions must have been experienced by such men as Wren and Telford among Englishmen, and by others who in the various epochs and under different circumstances have led what Professor Roger Smith has termed "New Departures." In a paper contributed to the Transactions of the recent Congress of Hygiene, I have endeavoured to show that it is perfectly easy to test in a qualifying degree the taste and designing power (as well as the constructional knowledge) of candidates for our calling; and, after an animated discussion, the Congress passed the following resolution by a large majority:—"That this meeting cordially approves of the principle of the statutory examination and registration of architects." Such a resolution may be taken as indicative of the feeling of the public in our favour, and should be a further stimulus to future effort in this cause. The rapidity with which this movement has, wherever understood, grown and found favour throughout the profession in Great Britain is surprising—I say *where understood* with emphasis, for I have met and talked with many architects who were at first bitterly opposed to the idea, but have in no single case failed, after a short conversation, to obtain an admission that the arguments in its favour outweighed the apparent objections, or that they had totally mistaken the principle of the proposed measure: the opposition is not to be wondered at, considering how some persons, and some sections of the Press, have gone out of their way to misrepresent our aims and statements. Let me point out one or two leading misconceptions with regard to registration. I will first meet the objection that any universal qualifying examination will exclude many of the very best artists from practising architectural work, as by the peculiar constitution of the artist-mind they are impatient of acquiring even the little science required to qualify for practice. Well let us, for the sake of argument, assume that such men would not come up to the scientific qualification, and would be prevented by an Act of Parliament from calling themselves "Architects," there is nothing to prevent them adopting a title distinguishing them as devotees of the artistic side only of our work, say "Architectural Artist," and in art circles they might secure a good practice, and still more often they would be sought as partners by registered men less gifted with a soul for art, but enjoying a lucrative practice on account of their constructional and business qualifications; but bear in mind we do not seek to prevent on the one side great artists, or on the other charlatans, from being employed, if the public choose to employ them, to do our proper work: we aim to put a stop to the desecration of the title "Architect" by its free use on the brass plates of men who have had no training in so difficult a craft, and one, moreover, in the practice of which the health and pockets of the public are much at our mercy. Another point to be kept in the foreground is that we aim only to secure a *qualifying* and not a competitive examination. The latter would be as fatal to our art as the former would be beneficial. Another fallacy must be noticed—the statement that men qualified and practising at the time of the passing of any such Act would have to pass an examination. Such a stipulation would be unjust and impracticable. Every practitioner who can give reasonable evidence that he has enjoyed a *bonâ-fide* architectural practice would be entitled to registration, while the affidavit to be signed by each applicant for registration, affirming under penalty that he has enjoyed a *bonâ-fide* practice, will at the passing of the Act exclude men who have no right to be included in the profession. Not that much progress in the training of architects is not being made: the past year has been a memorable one in this respect. The Architectural Association, which has always been the best friend of the architectural student, and to which in the past many men now well known, and greatly esteemed in the profession, have devoted much valuable time, has, true to its genius, just established a comprehensive and methodical course of training both in the lecture room and studio, and has changed its system of gratuitous teaching for a paid staff. I hope that many members of the Society of Architects will give some practical expression of what cannot but be the universal admiration of the pluck and energy of the Association. It still wants £1,000 to relieve its committee of anxiety as regards the expenses of the new scheme, and, as practising architects, we can do much for it by encouraging our pupils and assistants to attend the classes. As individuals I hope it will be our first aim to assist one another in improving our designing power. I cannot say that to this end I wish more members had joined our Belgium excursion, for a party of forty is quite large enough for practical purposes; but one can scarcely exaggerate the influence for good upon our taste which a tour among such art treasures exercises; we shall carry the inspirations there received to our own districts throughout England. One conviction has been much impressed on me by that tour—namely, the importance of greater uniformity in style, if we are to make our cities, towns, and villages effective architecturally. Bruges, for instance, is so impressive because its style and materials are distinctive and sufficiently uniform. It is neither a museum of architectural styles, like Venice, nor is it monotonous, like Brussels or Paris; there is endless variety both of outline and detail, without the sacrifice of that essential breadth and harmony indicative of unity of purpose: that is what we must strive to set right among ourselves and advocate upon every possible occasion. We are, as a nation, too cosmopolitan and too eclectic to warrant the expectation of seeing some consistency of feeling prevailing throughout an entire city; but the revival of municipal authority, and the creation of the County Council of London, gives an opportunity, never before enjoyed, of effecting a great reform by laying down a rule that each newly-made street shall be built in this spirit to the approval of the superintending architect, assisted perhaps by a committee of experts. The happy result such a regulation would have can be judged by a visit to Norfolk-street, Strand, and Brook-street, Grosvenor-square; while we may take Shaftesbury and Northumberland Avenues as instances of the disastrous effect of the absence of a sufficiently stringent regulation in this direction. With respect to the Incorporation proposals, or, in other words, an application to the Board of Trade to register our society as a limited liability company, without the word limited being attached to the title, I have to mention that the council have received through the Board of Trade copies of statements from the Royal Institute of British Architects and its allied societies in the provinces, as well as from the Architectural Association, begging that our application may be refused. It is obvious, on the face of all these documents that both our object in applying for such a license, and the privileges which it is in the power of the Board of Trade to grant, have been entirely misunderstood; but we are glad of the opportunity these petitions afford us of making certain official statements as to the position, aims, and prospects of the Society of Architects, which, we hope, will for ever put to silence the ignorant and unfounded statements which have been circulated. In conclusion allow me to beg each member to strive to contribute something to the common stock of information, which the experience of every man must enable him to offer to his society. Many might do this by attending the ordinary meetings, and taking part in the discussions. Gentlemen, I wish you a prosperous, profitable, and enjoyable session.

Mr. R. WALKER, in a genial and humorous address, moved a vote of thanks to the President which was seconded by Mr. Day, put to the meeting by Mr. G. Soudon Bridgman, vice-president, and carried by acclamation.

A business meeting of members was then held to discuss matters of interest to provincial members.

A discussion took place as to whether the time had arrived for establishing a lending library open to provincial members, in which Messrs. Walker, Bridgman, Tidman, S. C. Johns, Day, Allport, A. J. Lacey, of Norwich, G. W. Ferguson, of Belfast, and others took part. The risk of loss and injury, the necessity of largely increasing the library, the cost of transit, and the need for duplicating books most in demand were pointed out by various members, while the desirability of establishing such a library was generally agreed upon, and on the motion of Messrs. Day and Ferguson the matter was referred to the council to report upon.

The question of holding sessional meetings in provincial centres was brought up by the President who suggested that it would be wise to follow the example of the British Medical Association, the Incorporated Law Society, and other provincial bodies, and convene meetings in various towns. Messrs. Edwin J. Hamilton, of Brighton, vice-president, Allport, Bridgman, Tidman, Johns, and Ferguson spoke in favour of the suggestion. Mr. R. Walker urged that as London was the most accessible point in the kingdom, it would be unwise to hold such an important

ıeeting in a provincial centre, however populous; ıe President's address should certainly be de-vered, and the report and balance-sheet dis-ıssed in the metropolis. The motion of Messrs. Iamilton and Tidman, approving of the holding f occasional meetings in large provincial centres, ·as carried unanimously.

On Wednesday evening the President, Mr. W. Ioward Seth-Smith, invited the members and a ırge number of friends to a conversazione, ·hich was held in the rooms of the Royal ıstitute of Painters in Water-Colours, Picca-illy, which was very numerously attended. The ɔmpany included Sir James D. Linton, Sir ames Douglas, Sir J. W. Ellis, M.P., Mr. 'embroke Stephens, Q.C., Mr. R. G. Webster, I.P., Mr. Wyke Bayliss, Mr. H. T. Ashby president Institute of Builders), Mr. W. H. ɔlam (president Society of Engineers), Pro-ɛssor Banister Fletcher, Mr. James Orrock, ɔr. W. H. Corfield, and Dr. Dyce Brown.

THE SURVEYORS' INSTITUTION.

THE session of the above society, which commenced with the ordinary general meeting f Monday last, was opened by an address prepared y the President, Mr. R. C. Driver (but in his unvoidable absence read by the secretary, Mr. J. C. ɔgers), in which the present position of the Institution, of the profession at large, and of the ıterests with which it is concerned, were dealt ·ith in a manner at once clear, concise, and xhaustive.

After thanking the members for having elected im for a second term of office, and congratulated hem on the fact that, during his tenure of office, heir numbers had increased from a little over ,600 to nearly 2,300, the President took occasion ɔ remark on the change which had taken place in he constitution of the society, when, in August ıst, admission to membership without examina-ɔn ceased, in accordance with the provisions of heir charter. It seemed, he said, a not unfitting ccasion for a review of the work accomplished y the Institution during its twenty-five years of xistence, and a comparison of early promises ·ith subsequent performances; or, as the build-ıg surveyor might put it, to "measure up the ·ork," and take account of "extras and omis-ɔns" in the light of the original "specification." he Institution was founded "to secure the dvancement and facilitate the acquisition of that nowledge which constitutes the profession of a urveyor," "to promote the general interests of ıe profession," and to do so "for the public dvantage." The 27 volumes of "Transactions" nd "Professional Notes," comprising some 2,000 pages, dealing practically with almost very subject with which a surveyor was con-ɛrned, and the thorough and complete system f professional examinations, which, in spite of ll opposition, had been established ten years ago, nd through which many hundreds of young ıen had passed, were sufficient evidence of what ad been done towards the fulfilment of the first f the objects which the founders of the Institu-ɔn had in view. The second object had, he ıought, been fully attained by the action of the nstitution in binding together nearly the whole ody of surveyors into one powerful organisation, nd by obtaining a charter, entitling the members ɔ distinction as duly-qualified members of a ɛgular profession. Then the fact that, under ɛveral Acts of Parliament, the Surveyors' In-titution was constituted one of the recognised uthorities on important public matters, and that ; was not seldom the medium for the collection nd communication of most valuable information ɔr the use of Royal Commissions and Select ɔmmittees, entitled them to claim credit on their ıbours "for the public advantage." "We are ain enough to believe," said the President, ' that we have provided the public with a means f distinguishing between the qualified and the nqualified practitioner." Turning to general ɔpics, Mr. Driver gave some statistics which ad been collected by the Institution by means f its provincial committees of the depreciа-ɔn in agricultural land values in every part f England and Wales. The figures were ɔmewhat startling to a mind not intimately ɔquainted with agricultural affairs; but the 'resident assured his hearers that they had been ɔllected, compared, and compiled with the tmost care, and might be taken as a nearer ɔproach to actual facts than had been previously ɛtempted. In the Chiltern Hills district of Oxon the fall in rents during the last 14 years had been as much as 75 per cent. South-East Essex showed 70 per cent. reduction, while Cambridgeshire, parts of Berks and Suffolk, and the whole of Essex had experienced a decline of over 50 per cent. in rents during the same period. And so, down through a long list of percentages taken in falling order, and of which one might roughly take the average to be 25 per cent., were to be noted the effects of the agricultural depression in the various districts. The farms from 50 to 200 acres had fallen less in value than the larger ones; but the fact was patent that in many parts of the country a very serious depreciation in values had taken place. The causes of this depreciation were bad seasons, cheap imports, and low freights; and, putting aside the seasons as beyond human calculation, he proceeded, by further statistics, to set forth the present position of things, and to found on them a somewhat hopeful forecast of the future. The very general movement of the agricultural population towards the towns, as shown by the late census, was next considered, and a hope expressed that the Report of the Royal Commission on Labour would, when issued, throw some light on the causes of, and perhaps suggest some remedy for, the present serious state of things. Mr. Driver referred to the new order of affairs under which the large surplus which the Government found at their disposal was placed in the hands of the various county authorities, usually to be devoted to the promotion of technical education, and, while expressing considerable doubt as to the wisdom of what he described as "an extravagant endowment of non-existent agencies for purposes yet to be determined," and predicting that, at least, the difficulty would not lie in the direction of the disposal of the money, he firmly believed that honest efforts were being, and would be, made to give effect to the not very clear provisions of the two Technical Education Acts, under which any scheme of the kind must be worked. The Tithe Act of last session would probably remove a source of irritation which had been made a ground of agitation, and assist in the letting of some of the poorer land. He felt disappointment that the long-promised Metropolitan Improvements had again been "deferred, owing to a difference of opinion between our local and Imperial Parliaments" on the principles of assessment, and believed that "some of the fiscal purists who joined in the Quixotic crusade that resulted in the abolition of the Coal and Wine Dues, which formed such a useful fund for public improvements, are now in some doubt as to the wisdom of their proceedings." The Brine Pumping Act, though limited in its operation to a comparatively small area, introduced an entirely new principle of compensation, and, it was quite possible, might form a precedent of which the owners of property in the neighbourhood of large aggregations of works which, in one way or other, were detrimental to such property, might avail themselves. The proposal to assess ground rents or land values and vacant building land to the payment of local rates was a public question which had the most direct interest for surveyors, and this not only because of the immediate effect on the value of real property, but because these proposals were closely connected with the theory of the national or public property in the increased value of land. The President reviewed at some length the evidence before the Parliamentary Committee, and said that the principal advocate for the change maintained that all rates should "come out of property," which in towns, he said, was divided into (1) land, which derived its value from the presence of the community, and not from the expenditure of capital on it, and (2) buildings, which derived value from the outlay of private capital, and produced a return which, being subject to risk, was not of equal value to that produced by land, and should, therefore, be taxed at a lower rate. The whole permanent element of communal expenditure went, in this witness's opinion, to increase the value of the land rather than the buildings on it, and he thought that sites should contribute to such expenditure at a much higher rate than buildings. He proposed to assess them separately, say at 6s. in the £ on the land, and 4s. in the £ on the buildings, collecting the whole from the occupier, and allowing him to deduct it from his rent, and so on, in proportion, from each payment of rent down to the ground rent, if any. As regards the ratings of buildings, he would allow some readjustment of the terms of existing contracts, but rates on land values should be borne by the site owners as a new burden, without alleviation. He would assess all vacant building land at its annual building value, thus forcing it into the market, with the object of leading to a better supply of houses. These and other arguments from the same side the President proceeded to answer in a manner equally lucid and convincing to the practical mind. The increase of the value of town land did not, as he showed, depend on communal expenditure, for it took place as really in the roughest mining towns of South Africa or America, without any communal expenditure, as in London. The members of a community made provisions for their own comfort and safety, and it was the value already created which made expenditure necessary, and not the expenditure which created the value. It had been clearly proved, as a matter of fact and not of theory, that rates, so far, at all events, as London is concerned, do "come out of property." The separate assessment of sites would in many cases involve the payments of rates on ground rents which had been bought at a high price as investments on the faith of their stability of value. Nor was there any unfairness in the existing contract to justify such a confiscation, for the rates existing at the time of the granting of the lease fell on the ground landlord, and if no rates had been payable on the building, the lessee would have given a ground rent of just so much more as he was spared in rates; and, as the rental value of property in London had increased much more than the rates had increased, the building owner's liability for all increase of rates had been more than covered by the rise in the value of his leasehold interest. Building land had no value as building land apart from the value of a building that was, or might be, upon it. It was shown that there was no necessity for forcing such land upon the market, and that the proposals, if carried out, would seriously interfere with the market for building plots if the ownership of them involved an annual expense while the land lay unproductive. The speaker expressed a firm conviction that the taxes proposed were neither necessary nor just, and, by placing investments in real property at a serious disadvantage as compared with investments in personalty, would seriously affect public prosperity by restricting the free supply of land and houses. In these contentions he was fully supported by another witness before the Committee in the person of one of the past-Presidents of the Institution.

A vote of thanks to the President for his address having been moved by Mr. Wheeler, Q.C., and seconded by Mr. T. Blashill, and unanimously passed by the meeting, the proceedings then terminated.

THE DECORATIVE TREAMENT OF NATURAL FOLIAGE.*—IV.

IN his fourth and concluding Cantor lecture on this subject, delivered on May 4th last, Mr. Hugh Stannus, F.R.I.B.A., proceeded to the application of the rules already laid down. He observed that the decoratible surfaces on which natural foliage was applied were classified according to their shape, position, and function as panel, border, band, frieze, and indefinite shape and form. The decoration which might be applied to these surfaces was classified, according to its suitability to the shapes, as: panel ornamentation, border ornamentation, frieze ornamentation, diapers, body ornamentation, and free ornaments. The inclosing lines bounding a panel might be treated in colour (as in surface decoration), or in relief (as in architectural work); and they precluded any extension of the surface. Panel ornamentation might be rich in character. Panels were not a functional part of construction, and they were generally chosen as the place for the most elaborate work and the highest beauty. Their position with regard to the horizon governed the altitude of their ornamentation: when in a vertical plane, as on a wall, then it might be in a vertical attitude, and axial objects might be introduced; and when horizontal, as in a ceiling, table, or floor, then it would be indeterminate in attitude. The ornamentation should be complete in each panel or set of panels. Border ornamentation should be severe. Borders, being functional, should be

* Summarised, by permission, from the *Society of Arts Journal*.

subordinated to the panel. Their variability of attitude further restricted the class of elements, and only permitted such as might be reversed in attitude without incongruity. Border ornamentation should be capable of lateral extension, governed by the principle termed repetition, and by change of direction at the angles. Frieze ornamentation was generally rich in character. Friezes, being not functional, were often treated with the same elaboration and beauty as panels. Their invariable verticality of attitude permitted a higher class of elements than was suited to borders. Frieze ornamentation should be capable of lateral extension, and of change of plane at the corners. Indefinite shapes were generally treated with either free ornaments or diapers. Diaper ornaments were capable of indefinite repetition. Each complete unit of the diaper was circumscribed by lines, which formed an oblong or a regular geometrical figure, and were termed the repeat-lines. It was not necessary that the pattern-figure should show parallelism to them: more often, e.g. in textile fabrics, the repeat-lines cut through leaf and flower indiscriminately. Body ornamentation might be rich in character on vases, but must be reticent on pedestals and similar objects. For the bodies of vases diapers, although sometimes employed, were unsuitable, because uninteresting and difficult to apply—decoration which had one subject or meaning was the best for such surfaces. Passing on to consider the application of decoration to shape, the lecturer laid down the rule that when natural foliage was applied to an object for the purpose of decoration, it should be so treated as to appear to acknowledge the shape in which, and the surface on which, it was used. This could be effected in two manners — by keeping the decoration within the limits imposed by the enclosing lines, or by diffusing the decoration over the inclosed surface, the two methods being known respectively as parallelism and distribution. The former — parallelism — was an important principle in the application of foliage to inclosed shapes. All decorative art which appeared to acknowledge the given shape produced the impression of having been made for its place; and it was thereby more pleasing than if it gave the effect of being a portion that had been cut off from a larger panel. To attain this the lecturer advised a student, after the foliage was drawn to a given shape, to test the parallelism by drawing lines all round inside the latter, and parallel to it at a distance of, say, about ¼in., the distance varying of course with the scale of the drawing. He would then be able, should any leaves overlap this parallel line, to re-draw and move them back; and should any not approach it sufficiently near, to bend out the stems. Portions that were redundant should be cut away. These adjustments ought to be done with judgment, and the natural growth should always be adhered to. A number of progressive examples were shown illustrating how a design could be adapted and made more suitable for its position by increasing its clearness and parallelism. The second principle of treatment, distribution, was more important in those applications of foliage which did not require parallelism, as, for example, in diapers. In these patterns evenness of distribution was necessary, and any larger ground spaces that produced the impression of being "holes" were to be avoided. The extreme of evenness and density of distribution was seen in some Indian patterns, in which the parallelism was completely carried all round the inclosing lines, and the distribution was so uniform that all the interstitial ground spaces were of approximately even area. The opposite extreme of irregularity and sparsity was illustrated in many Japanese decorations, in which neither parallelism nor distribution was visible. Many English designs occupied the middle place in the scale between the uninteresting "texture" of the Indian and the irregular "spotting" of the Japanese work. While the Indian filled and the Japanese ignored the confining shape, the English design occupied it. Further than the distribution of the whole of the features of a plant over the given shape, there was a higher kind of distribution—the placing of the flowers among the leaves of a design, which was more difficult, but of the highest importance. There should be, Mr. Stannus thought, a feeling that the flowers were scattered over every part of a given shape, though not in positions which would be likely to attract attention. In panel ornamentation any appearance of artificiality in position or attitude ought to be carefully avoided. Repetition was never appropriately applied to the high-class features used in panels. The attitudes of leaves near the inclosing lines should be varied, to avoid artificiality and monotony. Artificiality in the position of flowers in panels should always be avoided. Indeed, flowers on the same vertical line, or on the same horizontal line, or in opposite angles, should never be seen in a design. Another useful rule was to avoid parallelism and proximity of the stems to inclosing lines, and also axiality of the stems in the centre of panels. Border ornamentation should be connected and not fragmentary. It should be always subordinated to the panel, in beauty of composition and colour; and never treated in a pictorial manner so as to lose the surface. The general lines of growth should be longitudinal—*i.e.*, following the direction of the border. Among the artificial borders were the vertebrate, the undulating, and the interlacing; and these were useful as suggestions for the general lines. Plants which had long stems or branches were most suitable for borders. The distribution of the design should be denser and more regular than in panels, and a good method of emphasising the border was to increase the density of the design towards the edge next to the panel in the centre. Frieze ornament should never be treated pictorially; but the semi pictorial was an appropriate treatment, and it should be rich and beautiful. The lines of growth should be upward or oblique. There should be no repetition in friezes. Diapers were used for three principal purposes—(1) to give a pleasing texture, at small expenditure, in places where more important work was not necessary; (2) to disguise imperfection in material—*e.g.*, where the pattern hid flaws in the casting or dropped threads in the weaving, &c.; and (3) to disguise the effect of usage, where the variegated surface made grease spots and stains not so conspicuous as they would be on a plain one. The effect of a texture resulting from careful distribution was therefore desirable. There were degrees in this evenness due to the character of the textile, from the dense distribution of the common carpet, to the sparse distribution of the brocade silk. In diapers, stems, where introduced, should be inconspicuous; but, if used at all, ought to be natural in treatment. Plants of different kinds could be effectually used together in a diaper: they should be very varied in character, but not incongruous. Flowers in diapers should be so arranged in position as to avoid alignment in any direction, and this, where repeats were employed, was by no means easy. The lecturer suggested that one way of overcoming this difficulty was to draw vertical, horizontal, and oblique lines through the first flowers introduced into a design, and then these lines should be carefully avoided in locating the other flowers. A good method of placing the flowers in a diaper was to paint a number of individual flowers, roughly, on loose pieces of paper; and cut them close round to the shapes. These loose flowers might then be moved about experimentally, until the effect was satisfactory; when they could be fixed permanently in their places, and the correct working-drawing made. There were two methods of designing diapers: In designing with artificial foliage, an artist began with a general idea of the composing lines; but in designing with natural foliage, he began by drawing a branch of the plant, and he did not attempt to make it follow any lines but those which God designed for it. He made duplicate drawings of this piece or branch, and then arranged them at the repeating distance prescribed by the technical necessities of the material. He filled in the gaps with more nature, if required, considering the placing of the flowers first. This method of composing a diaper by the arrangement of overlapping duplicates of a study from nature was more likely to be natural than the method of making lines first, and then clothing them with leaves and flowers, because there was no predilection or prejudice in favour of one set of lines over another, and the student was willing to take Nature's line; and further, the result would be masses of foliage rather than lines of stems. Indefinite shapes and forms, and also those of irregular or extreme proportion might often be easily decorated with natural foliage when the more intractable lines of artificial foliage could not be applied. Mr. Stannus having referred to the value and use of such unnecessary objects as vases, ribbons, and tablets, and also of animals and birds, in conjunction with natural foliage contended that the study of natural foliage would enable the artist to ignore the historic styles—the ruts worn by the wheels of our predecessors—except in scientific archæology. Natural foliage was, he held, the only kind of ornamentation that was permanently pleasing, or had been used in all times and places. In conclusion, the lecturer said that the rules which he had given were the result of some experience; but they were, at the best, only grammar. There was a grammar of graphic representation in all arts, in which minute rules were laid down for the guidance of the students; but there was also an enlarged grammar, of inspired expression, in each, which the masters laid down for themselves. The masters in the arts might appear to ignore rules, and produce thereby picturesque effects; they were great by reason, not of the broken rules, but of the power that was above rules. The student was therefore advised not to commence by striving to be picturesque (probably in this he would only be copying the faults of another), but to choose good grammar and simplicity; and in time, if he had it in him originality would be added unto them. The rules should not be too apparent—the student had to hide his art. The spectator should see Natural foliage, and should feel that it decorated the space. "Ars est celare artem"; and if the work appeared too artificial, then had the worker failed.

DRAWINGS IN BLACK AND WHITE.

IN the St. James's Gallery, King-street, St. James's, Mr. Mendoza has opened this week his annual exhibition of pen-and-ink drawings and monochrome paintings in oil and water colour. The collection does not strike one as exceeding in interest those of previous years, and we miss several well-known names of those who used to contribute. The post of honour is occupied by Mr. Frank Dicksee's illustrations to Shakespere's "Othello," which he has drawn for Messrs. Cassell and Co. They are sumptuously designed and exquisitely delineated, but their effect is heavy and old-fashioned looking, leaving a strong impression on the mind as to the labour of the artist with all his detail, heavy draperies and crowded groupings. In contrast with these elaborated works hang two somewhat slight studies by Mr. J. MacWhirter, A.R.A., of the Temple of Concord and the Church of S. Agostino. Both little pictures, done in grey and whites, give a fine idea of breadth and expanse of landscape, and a sense of size due to the skill of the painter in realising aërial perspective without needless effort. The "Old Garden at Girgenti," shown also by the same artist downstairs, is another work of similar merit. Here, too, is a view of the Gulf of Spezzia, by J. Fulleylove, R.I., deserving notice. Among the few architectural drawings exhibited we may name, as a laboured but clever black-and-white sketch, the Market Cross at Chichester, taken by Mr. Albert C. Thompson from the favourite standpoint, with the cathedral spire in the background. The stipple point has been too freely used to allow of the picture being correctly described as pen-and-ink. Mr. Walter F. Cave sends a small, unimportant sketch of the end of the apse of a church and some old, ugly houses in the Rue des Barres, Paris. The Magdalen Tower at Oxford, shown midst the snow in winter, is represented by Mr. Claude de Neuville in line. The point is taken from the water's edge, looking up at the tower, with the Magdalen bridge to the left of the spectator. An overdone subject thus obtains somewhat the air of novelty, an effect increased also by the snow. "Murder Hole," Lincoln, looks like a cutthroat corner by the side of the canal, which, in a heavy oil picture, is rendered in blacks by Miss M. Logsdail, who in a masterful way knows how to catch the atmosphere of the place, and to suggest the local colour of the scene. "The Chancery, Lincoln, in December," is also well delineated by her. Mr. J. J. Witcombe has a pretty sketch of a half-timbered Kentish cottage, hung too high for inspection, and the same difficulty obtains with Mr. F. P. Barraud's pen study of St. Jacques, at Dieppe. He also exhibits a picturesque drawing of a street in Rouen, with St. Maclou seen over the gables of the houses. From the same city is shown a large etching of St. Ouen, representing the central lantern and south portals, resplendant in their glory of lace-like traceries and cuspings, and having

apels of the choir in the fore-part of the composition, which is enlivened by several typically odern costume figures up to date in front of .e church. The artist is Mr. Edward Slocombe. e likewise exhibits a small etching of the thedral belfry at Newcastle, looking up the astle Garth. Miss M. Logsdail hangs on the ne near this last frame a pen-and-ink drawing the Bridge of Sighs, Venice. Strikingly eated with heavy shadings, and delicate detailg of a sculptured grotesque in the foreground. Pensiveness" forms the title of a fine study a girl's head by Miss J. Turner, who draws crayon; and we may equally commend Mr. E. Cox for his spirited brush drawing called Treachery." A village maiden, with a halter her hand hidden behind her back, is endeauring to coax two calves with a root, so that .e may catch them the more readily. The ads of these young things hardly look right, out the snout particularly; but there is a dash out the drawing which pleases us and shows ility. Mr. James Webb's oil-painting of Craft by Moonlight, near Rotterdam" is one the best pictures in the room: it would hold own in any gathering of monochromes. Miss . L. Bowley designs headings and initial letters cely, and draws them well. "What Now?" the title of a comic drawing of a terrier puppy ddenly looking round full of wonder as a etle is climbing up on to the inquirer's back, t quite out of his sight; hence the look of aint wonder, "What Now?" Mr. Edmund ldwell is the artist.

Before concluding these catalogue references e may draw attention to an attractive group of rabs and camels, by Mr. J. Shaw Crompton, lled "Visiting the Outpost." The sunlight in is drawing is unmistakable, the old chief on e central beast, shading his eyes with his hand he scans the horizon, is capitally drawn, and ere is a dash and go about the whole thing hich is commendable. We also like very much little pen-drawing by Mr. A. Paoletti, of a enetian Fisher Boy standing on a plank oking a pipe, and angling with an air of a ritable Izaak Walton. The pastel in colours a grandly-massed but voluptuous girl's head, Mr. Arthur Wasse, entitled "A Bacchante," undoubtedly clever; but we question the troduction of coloured subjects in such a colction as this. We much prefer the same artist's her female study down-stairs, called "Absent, t Present," drawn in black and white. The hibition is worth a visit when passing.

HE LONDON COUNTY COUNCIL, AND ARTISANS' DWELLINGS.

AT Tuesday's meeting of the London County Council, Earl Compton moved the adoption the report of the Housing of the Working asses Committee as to the erection of the rker-street lodging house, Drury-lane. The nders ranged from £13,988 to £18,500, and the e lowest were:—Mr. F. T. Chinchen, £13,988; essrs. J. Godfrey and Son, £14,297; Messrs. olloway Bros., £14,300; Messrs. Perry and ., £14,746; Mr. C. Wall, £14,850. When e committee first reported to the Council in arch, 1890, recommending the erection on the rker-street site of a model lodging-house accommodate 320 persons, the cost of the ilding, including furnishing, was estimated at 1,000, and the net return, to yield 4 per cent. on the outlay and value of site, was based upon charge of 4d. a bed per night. The lowest timate was £4,000 more that the original estiate, or £3,000 more if certain alterations in the ans where taken into account. Messrs. Gibson d Russell, the architects whose designs were lected in competition, attributed this difference part to the advance in the cost of building aterials and machinery, and the rise in wages hich they put together as representing per cent. of the total cost), and in part to ms added to the specification at the request of e committee, such as a separate building for ndry purposes, iron and cement divisions to bicles, instead of wood, stone facing to ilding, and granolithic pavement in lieu of ment. Referring to the tenders themselves, appeared that Mr. Chinchen, whose tender as the lowest, was not prepared to carry out e work. The next tender was that of Messrs. odfrey, which was only £3 lower than that of essrs. Holloway. After careful inquiry, the mmittee were of opinion that it was desirable at Messrs. Holloway's tender should be accepted. The corrected estimate of the cost of the building would be—Contract price, £14,300; cost of furnishing, £750; architects' commission, clerk of works, and quantity surveyor (not considered in original estimate), £1,100; total, £16,150. If a charge of 5d. per bed per night were made, after allowance for wages of persons to be employed, for empties, and for repairs, a return might be expected of over 4 per cent. on the above sum and on the value of the site, which for that purpose the committee calculated as ground-rent at 3d. a foot. The committee recommended that the Council do accept the tender of Messrs. Holloway Brothers.

Mr. Acworth, as an amendment, moved that the matter be referred back for further information. A long discussion ensued, and this amendment was rejected by a large majority. Mr. Hutton moved a further amendment, "That the committee be instructed to reduce the estimated cost of the Parker-street lodging-house to conform with the original estimate of £10,250." This was negatived by 54 to 25 votes, and the report was then adopted.

ELECTRO-LEAD TESTS.

A NUMBER of gentlemen connected with the engineering and building interests attended on Wednesday at the works of Messrs. Joseph Westwood and Co., Millwall, to witness a process by which iron, steel, and other metals may be effectually covered with a coating of pure lead, and be thus protected from the corrosive action of the atmosphere. Members of the committee, with their engineer, Mr. E. P. Binet, Assoc.M.Inst.C.E., of Great Winchester-street, met the visitors at the works. The process is an American invention, and claims to be a substitute for the ordinary galvanising process, and, therefore, from the wide extent of its applications to metals is likely to create a revolution in the galvanised metal trade. To the engineering and architectural professions these tests are of considerable interest, as the system adopted enables sheets for roofing, structural and ornamental metalwork, bars, wires, &c., to be treated either before or after the shaping, riveting, and other workshop operations have been performed. The most important fact connected with the process is that, instead of injuring the iron or steel by rendering it more brittle or crystalline, the coating of lead, which it receives in the bath, increases the ductility of the metal and even its tensile strength, and enables it to be subjected to severe tests without fracture of the coating.

The process of cleaning the iron in a bath containing a weak acid solution, through which an electric current is passed, was first shown; after which the articles to be treated are passed through limewater or clear water heated to 120°; then immersed in a liquid metallic solution containing hydrochloric acid and zinc and tin granulated in equal parts. The acids are then neutralised, and the iron is thus chemically cleaned and ready for the bath of prepared molten lead which finally coats it. One great merit of this preliminary chemical treatment is that the lead adheres to the iron. The chemical preparation gives the metal a strong affinity for the lead, by which means the iron so treated can be bent double and subjected to the hammer without deterioration or any exfoliation of the coating. Several practical illustrations of this were given, which proved its great superiority to galvanised sheets when similarly bent. No action is set up between the iron and lead coating, as in the case of iron and zinc in galvanised iron. The report of Messrs. Westwood shows that samples of round and square iron coated with lead stood a severer test before breaking than when they were galvanised. When doubled up cold, the galvanised iron scaled off and exposed the surface, while the lead-coated metal did not show any fracture of the coating. Sheet-iron was also tested with similar results. The lead-coated iron can be worked and put into any shape suitable for roofing. Many other tests with bolts and nuts, flanging, deck-bolts, gas and water pipes, ship-plates, &c., were reported. By this process the caulking required to riveted pipes can be dispensed with, as the lead coating makes a perfect water-tight joint at the lapping. With regard to cost, it is stated there is a saving in favour of this process of £9 per ton, or nearly 40 per cent. compared with galvanising—an important consideration—added to which the lead-coated metal is stronger, more ductile, and far more durable. It would be superfluous to say that the process is well adapted for every variety of engineering and constructive ironwork: bolts, chains, anchors, plates for ships, and various articles. The patents are owned by a syndicate, under whose auspices the experiments have been made, and they have decided to grant licenses to the different galvanising firms.

BOOKS RECEIVED.

A History of Nottinghamshire, by CORNELIUS BROWN, author of "Annals of Newark-on-Trent," &c. (London: Elliot Stock, 62, Paternoster-row.) This is another of the series of "Popular County Histories," and appears to be equal to any of its predecessors. Mr. Cornelius Brown has done full justice to its past history, its Bardolphs and other noble and ancient families, many of whom still retain their stately and ancestral homes. Many distinguished names are connected with this county, amongst them Byron, Kirke White, Cranmer, Secker, Warburton, Erasmus Darwin, Brewster, &c. For antiquarian and architectural readers, the notes contributed by Mr. Godfrey and Mr. J. Whitaker, F.L.S., will be found of interest. The county seats like Blythe, Newstead, Wollaton, Clumber, Thorsby, Normanton, and churches including Southwell Minster, Newark Church, Worksop Priory, and other famous edifices are dealt with. Legends and traditions, geology, the flora and fauna, dialect, and folklore receive careful attention and exposition, and the author seems to have brought under contribution all the State papers, historical manuscripts, the Rolls series, and every work of topography, history, and biography that could throw any light upon this "historic shire."——Another architectural poet of no mean order seeks fame in the person of Mr. John Cotton, F.R.I.B.A., of Birmingham, whose *Song and Sentiment* and *Lyrical and Other Verses* are published by Messrs. Simpkin, Marshall, Hamilton, Kent, and Co., Limited. The volume is enriched by a number of very creditable illustrative etchings, also by the author, who advantageously combines the qualifications of the bard and the artist. No thoughtful professional brother should fail to buy a copy of the book. He will find much in it to charm him, whatever his mind. Here, for instance, is a sonnet, of which, either as regards matter or method, William Morris himself need not have been ashamed:—

> Ah me! If but the Muses would inspire
> My sorry self with some great minstrel's skill
> That I might catch men's ears and throw a thrill
> Through all their spirits when I touched the lyre;
> Then would I bid them Liberty acquire!
> And Superstition's fetters loose until
> None owned a master save his reasoning will;
> Enfranchised thus the freed mind might aspire,
> And my blest song should win man to regard
> The rights of all his fellows as his own;
> No upstart then might lord it from a throne,
> No warring knave or bigot priest retard
> That wide fraternisation which alone
> By fostering peace can happiness award.

CHIPS.

At the monthly meeting of the West Hartlepool town council, on the 3rd inst., Mr. W. J. Steele was unanimously appointed assistant surveyor in place of Mr. M. Scott, who was recently appointed surveyor of the new borough of Thornaby (South Stockton). Mr. Steele served his articles with Mr. J. W. Brown, A.M.I.C.E., borough engineer, of West Hartlepool, in whose office he is now engaged.

At Reading, on Wednesday week, a statue of Mr. George Palmer, late M.P., was unveiled on the occasion of the opening of the park presented by that gentleman to the borough. The park is 21 acres in extent, and lies between St. Bartholomew's Church and the South-Eastern Railway; the pavilion, including caretaker's house and refreshment rooms, has been executed in oak and dressed stone by Mr. J. H. Margetts, from designs by Mr. W. Ravenscroft, of Reading, from whose designs the grounds have been laid out and fenced. The statue is of bronze, and was carried out by Mr. George Simonds, who is a native of Reading; the pedestal is of red Peterhead granite.

A commission of German archæologists has pronounced seventeen Egyptian mummies of kings and queens now in the museum of Berlin to be modern forgeries, executed at Alexandria by dealers in antiquities. No less than £40,000 has been expended within a few years by the museum authorities in the purchase of Egyptian antiquities, which have most of them now fallen under the same suspicion of spuriousness.

FREE LIBRARY, ASHTON-UNDER-LYNE.

The Free Library and Technical Schools at Ashton-under-Lyne, of which we give illustrations this week, are now in course of erection. The cost of the building is being defrayed by the trustees of the late Mr. George Heginbottom, J.P., of Ashton-under-Lyne, who placed a sum of £10,000 to the credit of the corporation for that purpose. This is one of a long series of munificent gifts left by the gentleman named to be expended on particular objects at the discretion of his trustees—viz., Mr. Thomas Heginbottom, J.P., Mr. Ely Andrew, J.P., C.A., of Ashton-under-Lyne, and Mrs. Atkinson, of Carlisle. The contract for the building has been let to Mr. Allen Holmes, of Ashton-under-Lyne, for £10,585, exclusive of ventilating, heating, or fittings. Messrs. John Eaton and Sons, of the same town, are the architects.

THE ANGEL FRIEZE, WELLINGTON MONUMENT, ST. PAUL'S CATHEDRAL.

The Autotype Company have just produced, under the direction of Mr. Hugh Stannus, F.R.I.B.A., a series of plates, collected in a handsome folio,* illustrative of the principal works by the late Alfred Stevens. By the courtesy of the publishers, we reproduce, in a reduced form, one of these autotype illustrations, and we have chosen the Angel Frieze from the Wellington Monument in St. Paul's Cathedral. The brief memoir and account of this master's chief works with which Mr. Stannus has enriched his monograph supply many details of a highly interesting character. Alfred Stevens was born of humble parents at Blandford Forum, in Dorset, in 1818. His father was a house-painter, and greatly given to pothouse pleasures. Indeed, one of Stevens's earliest works was rescued from a public-house, where his father had left it in settlement of a drink score. Young Stevens soon left the local school of Blandford Forum, and the helping of his father in the house-painting trade, for, under the patronage of the Hon. and Rev. Samuel Best, a neighbouring clergyman, who had seen some of Stevens's drawings, he was sent to Italy. At Naples he copied the works of Andrea del Sarto, and studied hard the examples of other schools, tramping his way to Rome, and so on to Florence, where he lived and worked for three years. He studied ornament at Milan under Albertolli, and was employed as an assistant by Thorwaldsen, the Danish sculptor. In 1844 we find him living again in London, poor enough and without friends. He suffered much misery, and at length accepted an engagement at Somerset House in the School of Design at a salary of £3 a week. This engagement he gave up in two years, and by slow degrees he got a little original work to do. Sir Robert Peel gave him a commission, and he worked for Cockerell at the Fitzwilliam Museum. He painted some panels at Liverpool, and designed a railway carriage for the King of Denmark. The gates for the Geological Museum were designed by him, but never carried out. Messrs. Hoole, of Sheffield, engaged Stevens to design some stoves for them, and the works executed from his hand were foremost in merit at the Great Exhibition of 1851. Six years later he was engaged in the National Competition for the Wellington Monument, which offered Stevens the first opportunity in which he could display all his powers of composition. Eight months he worked early and late at this design, for which one of the five prizes of £100 was awarded him. The commission was eventually placed in his hands, after a model of the arch of St. Paul's Cathedral had been applied to all the premiated designs, his being the only composition found at all suitable. The sad story of the execution of this masterpiece and its subsequent location is one of the most lamentable in the history of our art. The angel frieze here shown occurs along the main cornice of the monument, and the cruciform panels are situated in the soffit of the main arches. The originals of these belong to Messrs. H. W. and Ed. S. Atkin. Mr. Holford largely employed Stevens at Dorchester House, where the chimneypieces and other fittings were designed and executed by him. The grand little lions on the railing of the British Museum, designed for Smirke, the architect, are also his work. Mr. Bird, of the Autotype Company, has produced a fitting memorial book in which all these designs are brought together, and the volume should find its place in all the art libraries of the country. Some years ago Mr. Walter Armstrong, of South Kensington Museum, published a smaller work, "Alfred Stevens: a Biographical Study"; but it was necessarily incomplete as compared with the present folio, which we would advise all lovers of art to get a look at, both for the work it represents and the manner in which it sets it forth.

* Alfred Stevens and his Work. Being a collection of fifty seven autotypes, with a brief memoir and account of his principal works so far as they are known. By Hugh Stannus. London: The Autotype Company.

DESIGN FOR ST. LUKE'S CHURCH, WINNINGTON.

This was submitted in a kind of limited competition some months ago. The plan included a nave 35ft. wide, with aisles somewhat narrow, but not used exclusively as passages. The arrangement shown at the east end of the nave was intended to form a transition from the nave to a chancel of an ordinary width, and at the same time to give light over the pulpit, and to form a strong abutment for the nave arches. The tower (to be built hereafter) was placed at the end of an aisle, rather than in front of the nave, to allow of a future extension of the church westward. The result of the competition does not appear to have been announced.

SKETCHING ABOUT IN SOMERSET AND DEVON. BY J. NICHOLSON JOHNSTON, A.R.I.B.A.

Muchelney Abbey.—One of the numerous ecclesiastical buildings to be found in Somerset which have degenerated into farmhouses. The original abbey was founded by Athelstan, 930. In an orchard adjoining, the foundations of the ancient structure may easily be traced. It stands surrounded by fine trees in a flat moorland country two miles south from Langport. Tradition says Athelstan, King of the West Saxons, suspecting his brother Edwin of treachery, caused him to be sent in an open boat, with only one attendant, into the stormy English Channel, where he perished. Repenting of this cruel action, he shut himself up in a cell at Langport for seven years, and as an atonement for that crime founded, in the adjacent village of Muchelney, an abbey of Benedictine monks, which he dedicated to the honour of St. Peter and St. Paul. *Parsonage House, Stoke-sub-Hamdon.*—This is a very old manor-house of various dates, the earliest part 15th century, situated in Stoke-sub-Hamdon, a village near Yeovil, nestling under the historic hill of that name whence the famous Ham stone is drawn. The chantry-house at Stoke was originally erected about 1304, when the chantry was founded. Very little remains of the earlier buildings. The house which now exists probably dates from Henry VII. The chantry precin are entered through a fine Tudor gateway. hall, with a good 15th century collar-be roof, is on the ground floor on the no side of the entrance. In the east wall the room supposed to be the kitchen a handsome aumbry or cupboard. The li gabled room with the bell-cote is supposed have been a chapel; but it runs north and sou and there would be no occasion for a chapel w the chantry close at hand. The part of buildings which faces the street has in gr measure been rebuilt since the reign of He VII. On the right of the big archway i quaint sundial in the gable of the hall buildi I went into one room on the right of the ho entrance from the street—a charmingly-panell low-ceiled room; the top panels enriched w carving, all of good oak. It was painted grained a light satinwood! The occupier s the dark oak made it so gloomy. There wa modern register grate—the occupier said the open grate smoked! *Abbey Farm, Pres* situated two miles west of Yeovil.—The earl part dates from latter half of the 14th centu A fine octagonal chimney, with open work at top, is preserved. This is the kitchen chimn and the fireplace originally extended right acr the width of the kitchen; now they have limi it somewhat, and built off a small cupbo (almost a room) each side. The barn, wh stands at right angles to the mansion, is a specimen of 15th century. The roof is original one of Spanish chestnut, in good c dition. The principal entrance has a b projection, and is of ornamental appearan The last sketch is from Dartmouth, taken w on a visit last summer, and shows the quaint houses in Foss-street.

HOUSE, KEMNAL WOOD, KENT.

This house—"The Nizels"—stands in a w wooded site near Chislehurst in Kent. Extern the walls are faced with red bricks from Dunton-green Works, the half-timbering in gables, &c., being backed up with brickwork the panels rendered with cement. The roofs covered with pressed brown Broseley tiles. staircase is of oak, as are several of the specia designed chimneypieces and over mantels. ceilings of the reception-rooms are divided i panels with wooden moulded ribs, the fl being of oak parquet. Mr. Julius Sax fitted electric bells. The work was carried out un the direction of the architect, Mr. W. Jos Buxton, A.R.I.B.A. Our illustration is ta from the drawing exhibited this year at Royal Academy.

THE GRAND HOTEL, NEWCASTLE-ON-TYNE.

We illustrated the exterior of this building October 16 last, and fully described it then. now give illustrations of the principal stairc and a corner in the assembly-room. The h staircase and the ground-floor fitments are al oak. The architects of the hotel are Mes Lamb, Armstrong, and Knowles, of 38, Gra ger-street West, Newcastle-on-Tyne, and contractors are Messrs. Middlemiss Bros.

Mr. S. J. Smith, C.E., Local Government Bo Inspector, held an inquiry at Cardiff on Friday w reference to an application which had been m by the corporation for permission to borrow £2 for the purposes of an infectious diseases hosp £21,450 for the extension of the Town Hall Municipal Buildings, £3,170 for the formation new street, and £2,500 for sewerage works.

A conference of representatives of the Me politan Local Governing Authorities is to be to consider the question of amending the Me politan Building Acts in connection with the C solidation Bill to be introduced next Session. Am the representatives are Mr. P. E. Pilditch, F.S and Mr. Herbert Sanders, Q.C., who will repre Kensington.

On Saturday afternoon, the students in the se classes in building construction of the Glasgow West of Scotland Technical College visited Kelvinside Brick Company's brickwork and H man kiln. They were conducted by Mr. Willi son, the manager, who explained the proces manufacture. Afterwards the students vis Temple Church, New Kilpatrick. Mr. Aitken, clerk of works, led the party over the building, explained many points of interest. Before lea each place, the lecturer, Mr. Charles Gour A.R.I.B.A., proposed a vote of thanks to gentlemen who had conducted them, which wa each case heartily responded to.

ELEVATION TO CRANBORNE ST

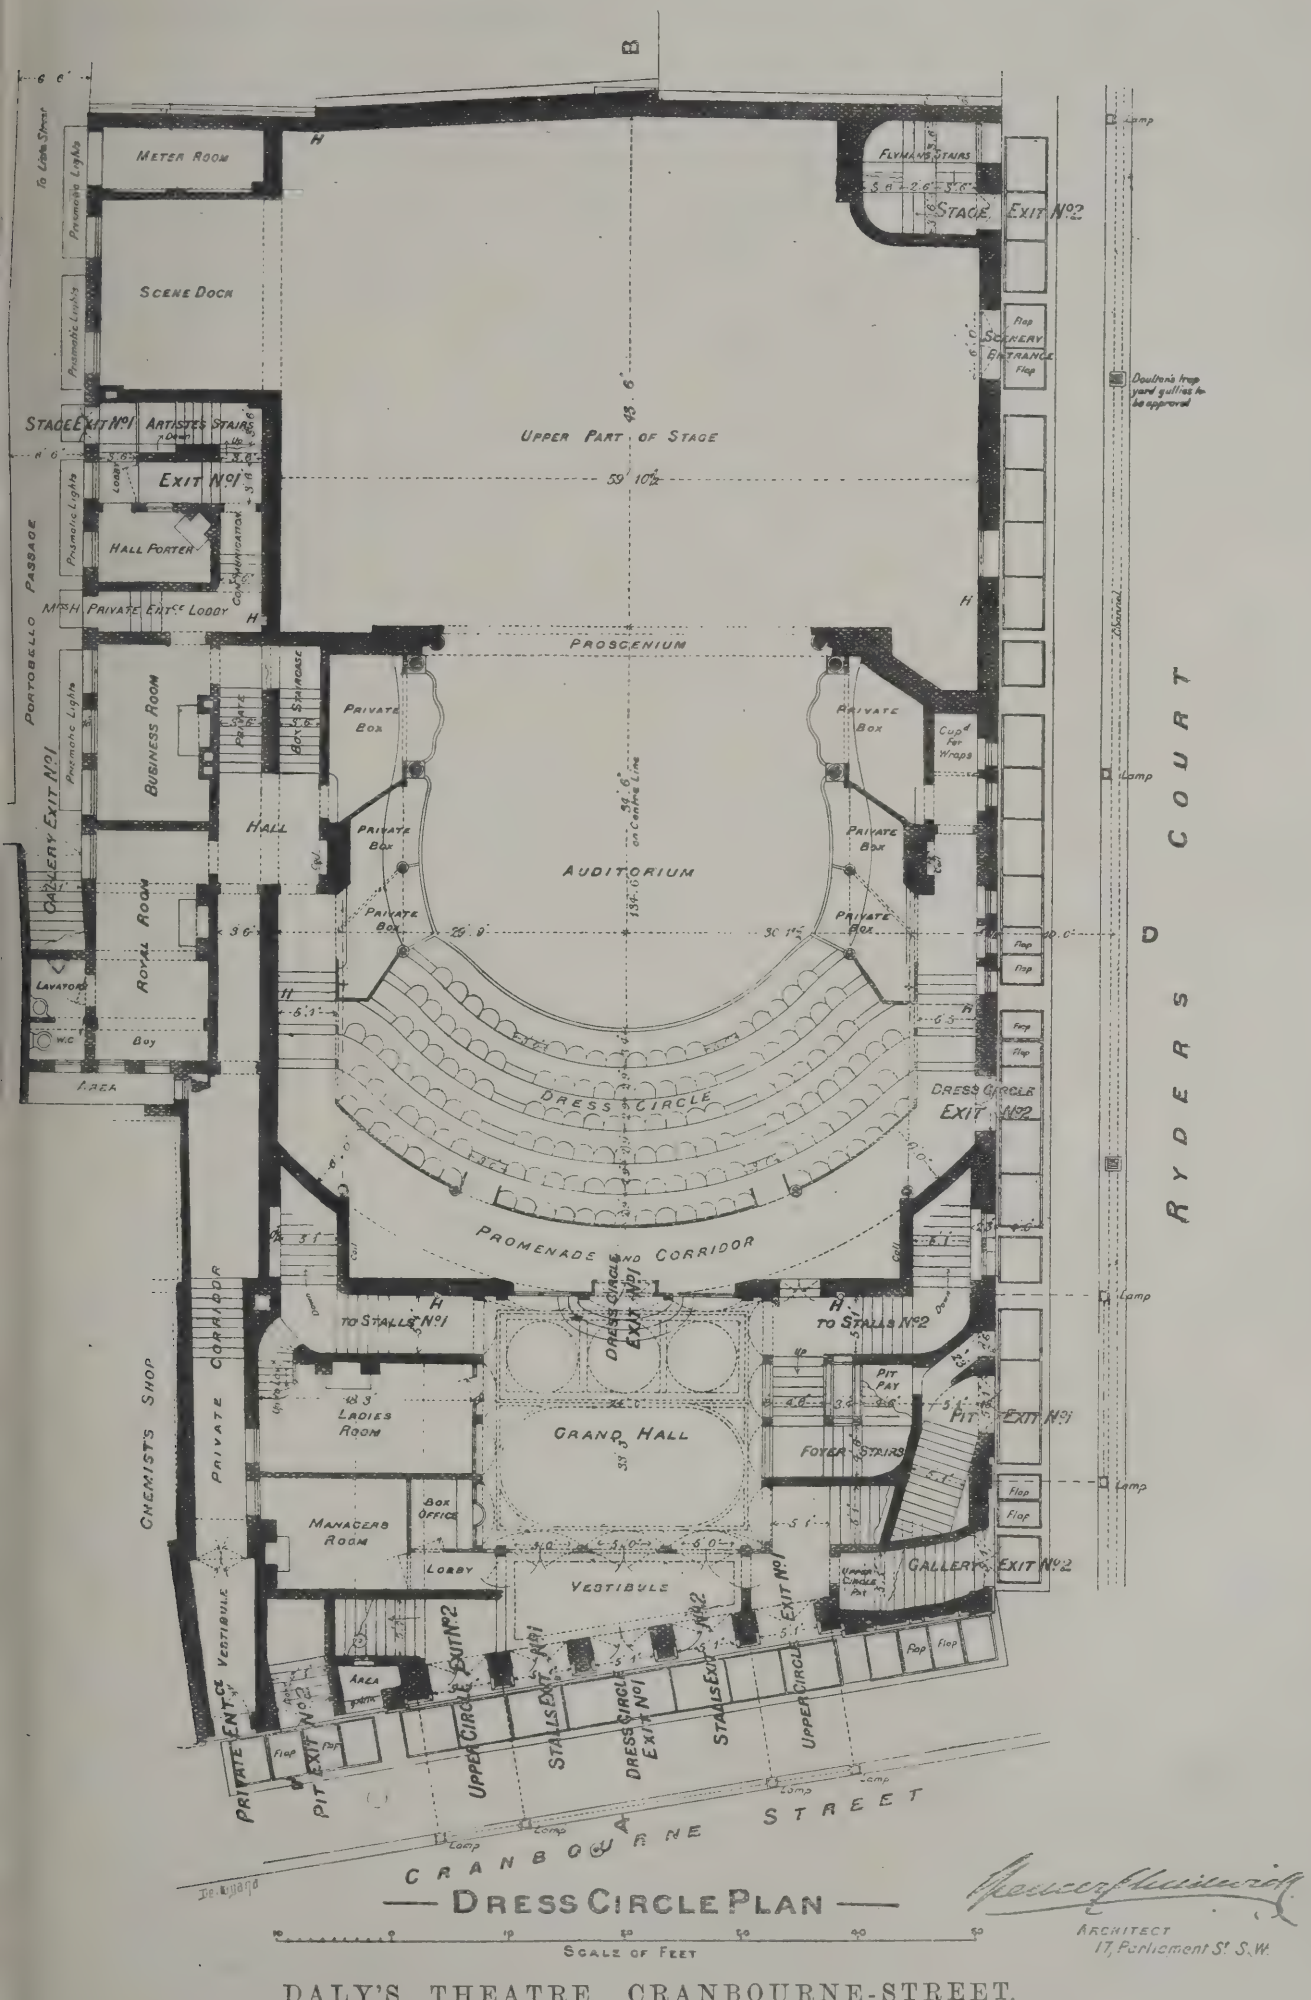
ROBERT BOYLE AND SON, LIMITED.

THE Directors of Robert Boyle and Son, Limited, ventilating engineers, London and Glasgow, have resolved to recommend a dividend of 12½ per cent., free of Income-tax, on the ordinarry and deferred shares of the Company for the year ending September last, after placing to the reserve fund one-sixth of the profits earned. This makes the sixth dividend, 12½ per cent. being paid for the last two years, and 12 per cent. for the previous years.

The year ended has been the most profitable since the formation of the Company. The Directors attribute this success, and their consequent ability to pay such a handsome dividend, to their constant study of the requirements of architects, and to the great and ever-increasing demand for the latest improved form of the self-acting air-pump ventilator, which, though much superior in design, make, and action, is now sold at 50 per cent. less than previous and inferior forms, constituting it not only the most efficient and ornamental, but the cheapest, ventilator in the market.

The Company have at present some very important contracts in hand and in prospect at home and abroad.

Mr. Robert Boyle has recently visited South Africa, and has established agencies in Cape Colony, the Transvaal, Natal, and Orange Free State, where large stocks of the ventilators have been purchased.



The Boyle system of ventilation has been applied to, and adopted for, amongst a large number of other public buildings in South Africa, the Houses of Parliament, the Castle and Town Hall, Cape Town; the High Court House, new Government buildings, and new Stock Exchange, Kimberley; the new Stock Exchange, Theatre, and Pavilion, Johannesburg; the new Club, Court House, and Hospital, Pretoria; the House of Parliament, new Town Hall, Municipal Buildings, and Railway Station, Pietermaritzburg; the Town Hall, Municipal Buildings, and new Railway Station, Durban; the Cathedral, Grahamstown; new Theatre and Opera House, and the drainage system, Port Elizabeth, &c., &c.

DALY'S THEATRE, CRANBOURNE-STREET.

LAST Friday week Miss Ada Rehan laid the corner stone of a theatre which is to be erected for Mr. Augustin Daly in Cranbourne-street by Mr. George Edwardes, and which will be a notable addition to the theatrical institutions of the Metropolis. The new theatre faces the main thoroughfare from Piccadilly to Covent Garden, having the principal entrance in Cranbourne-street, which leads to the stalls and dress-circle, an adjacent entrance leading to the upper circle, and the pit entrance being in a passage known as Ryder's-court. Mr. Spencer Chadwick has designed the building, and it is to be complete by the autumn of next year. The main entran hall measures 38ft. by 24ft., with foyer stairs the right and a ladies' room to the left, wi stairs to the stalls on either hand. The aud torium measures about 60ft. by 50ft. The sta is of similar dimensions. The domed foyer ov the entrance hall makes a great feature in t design, and the point from which the sight-lin radiate in the theatre are taken at a lower lev than usual, with a view of insuring a comma of the stage from all parts of the house. E trances are obtained on both sides of the buildi in Ryder's-court and in Portobello-passage, well as from the main front in Cranbourn street. The stairs are 4ft. 6in. and 5ft. wide all cases. The floor of the pit has a fall of o in twelve. The elevation is in the Renaissan style, and is to be executed in Ham Hill ston The contractor is Mr. Frank Kirk, of 19, Abin don-street, Westminster, S.W.

The reopening of Whaddon parish church, aft the restoration of the south aisle and roof, to place on Wednesday week.

The Queen has been pleased, by Warrant und her Majesty's Royal Sign Manual, to direct lette patent to be passed under the Seal appointed by t Treaty of Union to be kept and made use of place of the Great Seal of Scotland, granting Supplementary Charter to the Royal Scotti Academy of Painting, Sculpture, and Architectu

DALY'S THEATRE, CRANBOURNE-STREET.

WAYSIDE NOTES.

HE Society of Architects has opened its session with a most enthusiastic and enjoy- e burst of conviviality. Mr. W. Howard h-Smith's second term of office as president ms likely to be characterised by the same ial influences which so largely conduced to prosperity of the Society when he first occu- d the chair. He has the good fortune to be e to gather about him men of eminence in all lks of life, and it is evident from their sence, when his fellow-members rally around n, that the chiefs of British art—the illus- ous presidents of the principal art societies ave fully accorded to the Society over which . Seth-Smith presides, the fraternal recogni- n which the more antiquated of their own pro- sion churlishly refuse.

notice, by the way, though, that while the yal Institute of British Architects has hing but fire and brimstone for its younger l more energetic brother-society officially, its n leading members evidently wink at this, l hasten to gather round the festive board of Society at Mr. Seth-Smith's invitation. This most satisfactory. Quite the best speeches re made at the Society's Members' dinner on esday evening at the Holborn Restaurant by llows of the Institute. Mr. T. W. Connon's d-tempered but most complete exposure of fallacies in Mr. J. MacVicar Anderson's ent presidential address, was as clever as it s thoughtful and considerate, and Mr. Ernest y was not a whit behind in his neatly-put a for the recognition of the Fine Arts.

As a rule I never listen to after-dinner eches; but I must say I did on Tuesday, and rnt a good deal from some of them—from Sir mes Linton's eloquent and instructive history the progress so far of the effort to found the w Gallery of British Art, and from Mr. Wyke yliss's most admirable exposition of the ims and due position of architecture as a fine . That the society's own orator—whom can nean but its most genial past-president, Mr. bert Walker?—fully upheld his reputation, withstanding the high-water mark reached the speeches of the evening, goes without ing, and even the chairman of the Improve- nt Committee of that much-abused body, the ndon County Council, drew an appreciative l hearty cheer when he wished he had more ney, so that he might be kinder to architects.

Mr. Seth-Smith's opening address at the ening meeting on Wednesday afternoon at James's Hall was a thoughtful contribution to elucidation of the problems the Society has itself to solve, and will, I am sure, be read th interest by the whole profession. His appeal the support of the Architectural Association its new and admirable expansion was the best d most courteous reply that could be made to somewhat churlish conduct of the latter body, ich is, in a quite uncalled-for fashion, joining Institute in its opposition to the Incorpora- n which the Society of Architects is seeking. e conversazione at the rooms of the Royal stitute of Painters in Water Colours was, in way, as successful, and, of course, a much re numerously-attended gathering than the mer on Tuesday. Nothing that could be done the comfort of the guests had been omitted, d the company dispersed with the heartiest shes for the continued and largely increased cess of the Society of Architects and its esident.

There is no doubt that the membership of the ciety will very largely increase this year. in early, all that mean to—for two reasons. rst, you won't get in much longer for the very dest entrance fee now payable; and, next, at you may be in time to have a voice in the angements for the New Year, which I believe ll be of a somewhat ambitious character. The ciety has already received a Royal *exequatur* road. It is, I hear whispered, quite on the ds that equal honour may await it in 1892 rer home.

Mr. T. Mullet Ellis deserves to have gained der renown for his name in having called ention to the carbuncle on the top of Somerset use. His letter first called general attention the subject, and it only shows how we may jog along in a *laissez faire* spirit that no one was earlier in denouncing the eyesore. I am myself fairly wideawake in noting subjects fit for an architectural topic, but must confess to have frequently looked upon the unwelcome stranger, and that with no thoughts or sentiments out of the common, and no indignation swelling within me. I had altogether failed to remark the unsightliness of the intruder. Yet no sooner had your correspondent pointed out its shortcomings, than we all recognise the absence of the wedding garment. And now there is a pretty kettle of fish! The P.R.I.B.A. alludes to the subject, and the Institute passes a resolution condemning the erection of such a mass of iniquity in connection with the hallowed façades of Somerset House; while the lay press "catch on" the cry and hound down the offending structure. There is not a shadow of a doubt but that the mass of stock-brickwork is to be condemned, since it spoils a grand *coup d'œil*; and as fine prospects are not common objects of the Metropolis, this is the more to be regretted. I should like to see the offender removed, as no sort of dressing-up of the external elevations would make it fit for the company in which it has been placed. The ugliness reaches to the bone—or brick—in very truth in this case, therefore I fail to see how the authorities of the college could "ameliorate the unsightliness of the addition" on Professor Kerr's theory; such attempts being certain to prove failures, and only likely to demonstrate that architecture is not to be produced by masks. It were better to leave the building as a monument to mark the zenith of an Any-style-you-like-and-none-if-you-don't-want-it era in London architectural design. It will form a grand object lesson the next time that Mr. Blashill, or any other architect — say Mr. Stephen Salter, F.R.I.B.A.—lectures upon the municipal control of architecture.

In Mr. Seth-Smith's presidential address to the Society of Architects, allusion was made to the necessity for greater uniformity in style in cities and towns, and I wish that such a desirable end could be attained, or, at least, that control could be had over those offending spirits who will put up elevations which are intrinsically ugly and out of harmony with any and every style of design. It is not plainness or baldness that I now refer to; but "the indulgence in quaint personal conceits or idiosyncrasies, not necessarily beautiful because novel, instead of the manly effort to curb mere selfish Quixoticisms, and to produce results which will be pleasing to the refined taste of others because in harmony with what is beautiful." This is a vice that is possible of eradication, and one that will grow less as the education of architects becomes greater. The want of uniformity in style is far more difficult to deal with, because it is to be referred to the age, which is restless, unsettled, and constantly desiring change in all matters, whether domestic, political, or religious.

Mr. Seth-Smith said much about Registration that deserves weighty consideration, and on the subject of "A, a P, or an A"—to which one seems to be ever brought back—his address contained a remarkable allusion to those pleasures of science as well as of art, that should be the portion of the Architect. "Can we imagine," says the President of the Society, "that the joy experienced by the Architect of Nature is confined to the beautiful forms and colours with which He has dressed physical creation?" This is using the highest imagery to press the acceptance of a doctrine that many of us will readily receive. There is pleasure in the solution of constructional problems—which I suppose the "A., a P. or an A." gentleman, sending the same to a friendly engineer or firm of ironmasters, do not feel—and there is pleasure in the solution of purely scientific questions dealing with the suitability of a building to its particular end, even if only in the matter of those drain-pipes, &c., about which the renowned *Times* correspondents were so scornful.

After what seems rather a considerable delay, the proposed municipal lodging-house scheme has been brought into another stage of development. The County Council have decided to accept the tender of £14,300 of Messrs. Holloway Bros., and to proceed with the execution of Messrs. Gibson and Russell's design. The building will be in Parker-street, Drury-lane; and if the lodgers of the neighbourhood are able to appreciate the cleanliness and order that will be conspicuous features in the establishment, the success of the venture is assured. The original estimate having been about £10,000, it would have been a cause for surprise if no councillor had attempted to prevent the increased expenditure; and as a fact the motion so to do was duly forthcoming. Being ineffectual, however, as it should have been, the committee's recommendation was agreed to, and the architects will not be put to that wearisome process of scraping down the building to reduce the cost, which always puts the designer out of conceit with his work.

The aphorisms of Mr. W. H. Bidlake, as set forth in his paper on "Pitfalls on Commencing Practice" ought to be printed in numbered verse form, mounted on a card, and hung in the office of the verdant practitioner, thus:—

1. Get a client.
2. You must put up a house for somebody before anyone will trust you to put up a house.

* * * * *

21. Endorse any verbal agreement by letter, and keep a copy of it.

* * * * *

91. Be sure of your foundations.

And so on. The maxims are all excellent.

The past two weeks have seen many scientific societies commencing work for another session. Among them is the Institution of Civil Engineers. In the presidential address of Mr. George Berkley were many topics of interest to architects. The address was one of the best of the year, and was arranged in that historical manner that never fails to prove attractive.

The change of status of the Association of Sanitary Inspectors, which has been long impending, is at length an accomplished fact. In the inaugural address opening the new session, on Saturday, Mr. Alexander attributed the desire for this change to the conviction the members had arrived at, that the best chance for future sanitary progress lies in the education of the younger members of the community. With this in view, the associated inspectors have accepted the responsibility (without emolument) to establish lectures, classrooms, and examinations, to award prizes and grant certificates, raising money, holding estates, and receiving gifts of money or property for the purpose. The society, under its new name of "The Sanitary Inspectors' Association," has inaugurated its new institution by passing two resolutions of public importance. The first called upon the council immediately to consider what action could be taken by the association to put an end to, or to diminish the practice of, building back-to-back houses, which every sanitary canon utterly condemns, and the second suggested that the Education Department should be memorialised in favour of making hygiene one of the class subjects in elementary schools. GOTH.

CHIPS.

At Broadway Church, near Chesham, a reredos, altar, super-altar, and retable have been erected as a memorial. They are 13th century in style, executed in English oak. Mr. Charles H. Rew, of Great Berkhampstead, was the architect, and Messrs. Harry Hems and Sons, of Exeter, carried out the works.

The new council chamber at Leith was formally opened on Monday. It gives double the accommodation of the former room, which occupied a portion of the present site, the new meeting-room being 35ft. by 22ft., and adjoining are committee and reading rooms. Mr. James Simpson was the architect.

At the adjourned hearing at Newmarket of the charges under the Bankruptcy Acts against Francis Johnson, builder, Fordham, he was committed for trial to the Assizes, the charge against his brother, James Johnson, of aiding and abetting him in the concealment of property being dismissed.

On Wednesday week two pumping engines, erected at the Cosford station, near Shiffnal, of the Wolverhampton Waterworks, were formally started. The engines were built by Messrs. Hathorn, Davey, and Co., of Leeds. One of the engines, of 150H.P., is erected for raising the water from the artesian well to the surface; the second engine, of like construction, is provided for pumping the water to the Tettenhall reservoir. The engine-house was erected by Mr. H. Willcock, of Wolverhampton.

BUILDERS' BENEVOLENT INSTITUTION.

ANNUAL DINNER.

THE forty-fourth anniversary dinner, in aid of the funds of this Institution, was held on Thursday, the 5th inst., at Carpenters' Hall, London Wall. Mr. B. E. Nightingale, the President of the Institution, occupied the chair.

The Chairman, in proposing the toast of the evening, "Success to the Builders' Benevolent Institution," said this charity, which had been founded for the purpose of helping those who had been less fortunate than the gentlemen he saw around him, had been in existence some 44 years. During that time more than 250 persons had been assisted. At present there were 54 pensioners, and several people were waiting the opportunity of receiving their benevolence. The work of assisting their less fortunate brethren was one which should commend itself to the liberality and generous sympathy of all those connected with the trade. They must all know many men who had "gone under" through no fault of their own, but by stress of circumstances over which they had no control. It was sufficient to know that men holding at one time good positions had left their widows and families unprovided for, and that those who subscribed to this charity were doing their best to help such unfortunate persons. This Institution depended entirely on the liberality of the members of the building and allied trades, and was therefore unlike many charities which could appeal to all classes of the community. The chairman concluded his appeal to the sympathy of his hearers, by coupling the toast with the name of Mr. George Plunkett, J.P., the treasurer. The toast having been duly honoured,

Mr. Plucknett replied on behalf of the Institution, and said that this year the lamentable strike would influence the receipts of the charity. At the same time, he had such confidence in the builders of London, that he did not believe they would allow the Institution to dwindle for want of funds. It had now been in existence for many years, and had always managed to meet its requirements. The committee would like to see the income increased, as they were only able to provide relief at present for one out of the four applicants, and thus three old people, who might not live long enough to benefit by the Institution, had to stand over for some time.

The Chairman also gave "The Worshipful Company of Carpenters," referring to their kindness in giving the use of their fine hall, and subscribing largely to the funds of the charity.

Mr. B. J. Jacob (Warden of the Carpenters' Company) replied, and added that his only regret at these gatherings was that the subscriptions had not amounted to four figures.

Mr. J. W. Hobbs proposed "the Chairman," congratulating Mr. Nightingale on the manner in which he had fulfilled his duties. The trade had been passing through a most serious struggle which had resulted in heavy loss both to employers and employed, and it required a brave man, with such a fight looming in the distance, to undertake the presidential duties. The toast was received with acclamation, and the chairman made a suitable reply.

In the course of the evening subscriptions and donations to the amount of £836 were announced, of which sum £576 appeared in the president's list, including his own donation of £100.

SUGGESTIONS FOR STAINED-GLASS WINDOWS.

A VERY good selection of designs for stained-glass windows for houses and churches, executed at St. Peter's Works, Gaythorn, Manchester, by Mr. W. G. Sutherland, stained glass and decorative artist, of 15, St. Ann-street, of that city, is before us. The designs selected are representative of the character and prices of leaded lights and stained glass as executed at the works, and not as conveying examples for actual buildings. Mr. Sutherland makes special designs to suit the aspect and purpose of any work, and is prepared to execute architect's own designs. Business premises, private houses, and public edifices are frequently adorned by stained glass, either for purposes of advertisement or decoration. Some of the designs show clever adaptations for windows, and devices from quite plain square leaded lights to those of more ornamental character having devices and figure-subject centres. Admirable patterns for plain leadwork are shown on designs Nos. 5, 7, 10, 12, 13, 21, 25, 27, and 28. The panel centres and borders introduced in No. 31 for square lights make very effective windows. The plain leaded lights in sheet glass are from 1s. 3d. to about 3s. 3d. per foot, exclusive of marginal lines. Several designs suitable for hall and staircase windows, for buffets and restaurants, panel lights, oblong, circular-headed, and square windows are given in Nos. 49, 50, 53, 54, 56, 61, 62, 64, 74, 77, 78, 79, 80, 82, 93, 94. Decorative panels of figure subjects representing the Seasons, "The Lady of Shallot," and other poetical subjects are given. The plain geometrical, symbolical, and figure designs for church windows, which form a second part of Mr. Sunderland's book, are also worthy of the attention of architects. These designs are suitable for single lights, traceried windows of different forms, and contain several designs in correct taste, and of ecclesiastical character. The price list appended gives the price per foot of plain leaded lights. Of course, the price of a window is considerably reduced by having a proportion of the surface surrounding the centre in plain work. Mr. Sutherland's designs will at least afford architects some valuable assistance in the preparation of their own designs, and in the arrangement of the lights and margins, while the examples illustrated will be of service in specifying.

CAVITY WALLS.

THE value of a hollow wall during da rainy weather is not recognised as it s be by builders of our dwellings. Outer of houses in the suburbs of the metropol built as thin as possible, partly to save brick and also to give as much room as possib ternally. A few inches sometimes are o portance. Probably for these reasons a c wall is not entertained. But the loss of re trifling. For example, a 11in. cavity wa be built instead of a 9in. solid wall, making a difference of 2in., and if the two thicknes four-and-a-half brick are well tied togeth cramps, the work may be regarded quite as stantial as a solid wall, and completely pervious to moisture. Still, the solid 9in has a look of compactness and solidity ab which goes in its favour. As a matter of however, a properly cramped 11in. or 12in. h wall has equal strength, and if the 4½in. thicknesses are well bonded an good material the result is superior there is more base and lateral resist One of the objections to hollow walls of 4½in. thickness is that the inner thickness c carry heavy floors and timbers; but for all poses where 12in. walls are built, the obje is futile. Of course, for buildings of thr four stories the outer walls would be of work—that is, a 9in. outer skin of brick, a c of 2½in., and an inner brick thickness of 4 or, if preferred, the whole-brick thickness m placed inside, and the half-brick outside. T who have any experience in hollow brick know quite well the value of the objections against walls of this description. Much de

* All rights reserved by the Author.

) iron cramps used, which should be of ht or cast iron, dipped, when hot, in tar, e placed about 3ft. apart in the courses, very three courses high. The cramps are . at the ends, and should have a bend in ntre. Care must also be observed by in- ing strips of lead over all door and window that occupy the cavity.

COMPETITIONS.

TERSEA.—A limited competition is being t Battersea for a new town hall, and Mr. m Young, F.R.I.B.A., has been appointed or. Twenty-four architects were invited, welve designs have been sent in. All awings, which have been marked alpha- lly, are strictly under lock and key, not he members of the committee having as yet hem. The referee's award will be brought the meeting on Monday next, and after it en confirmed, the plans will be shown to blic. The cost stipulated is £25,000. It e likely, however, that all the requirements e conditions will be obtained for that at.

RTON-UNDER-CANNOCK.—The Norton-under- ock District School Board have adopted the ns submitted by Mr. Geo. H. Cox, architect, rmingham, for the proposed new schools at nhills.

FORD.—No less than 134 designs have been red for the municipal buildings at Oxford, at the referee, Mr. T. E. Collcutt, has no task imposed upon him in the work of ion. As a matter of course, many of designs are of a trivial character; we have it from a reliable source some few are of exceptional merit in e treatment of Late Gothic, well suited to a of historical associations like Oxford. Five ns will be chosen for a final contest, but bly none of the present drawings will be ited.

CHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

VERPOOL ARCHITECTURAL ASSOCIATION.—On ay evening last nearly fifty architects' tants connected with the several firms in the partook of their second annual dinner at the on Restaurant, Lord-street, Mr. T. W. gh being in the chair. After a vote of thanks e chairman had been carried with acclama- a most enjoyable evening was brought to a by the singing of "Auld Lang Syne." The ramme was specially designed by Mr. T. W. gh, the president, and on the title-page a of Mernigerode Rathaus was cleverly eated within an architectural border, in- ed with emblems of the fine art.

EFFIELD SOCIETY OF ARCHITECTS AND SUR- RS.—The usual monthly meeting was held e School of Art on Tuesday night, the 10th , Mr. Innocent, the president, being in the r. The following gentlemen were nomi- d for the studentship of the society: Messrs. . Innocent, Frank Wilson, Oscar Bromley, k Greaves, W. A. Hall, and W. Woofin- A paper was read by Mr. E. M. Gibbs, -president, on "Architectural Education in field." A discussion took place, and a ty vote of thanks was awarded to Mr. Gibbs is paper.

CHIPS.

a Saturday last new branch stores for the nsbury Industrial Society were opened at nton, Bradford. They consist of stores for ery, drapery, and flour, with warehousing and it's house attached, and have been erected from gns prepared by Mr. Herbert Hodgson, .I.B.A., of Bradford, by local contractors, at a of about £1,000.

r. Henry Richards, C.E., member of the In- orated Association of Municipal and County ineers, and district surveyor of highways for the shes of Barnes and Mortlake, was, on the 4th nt, elected a Fellow of the Surveyors' Insti- n.

ne eighth session of the Dundee Institute of itecture, Science, and Art was opened on lnesday week in the hall of Y.M.C.A., Dundee, Professor G. Baldwin Brown, M.A., Edinburgh, delivered a lecture on "Some Notes on the wth of Cities." Mr. Charles Ower, C.E., the ident, occupied the chair.

Building Intelligence.

ALNMOUTH.—A new Wesleyan chapel was opened on Tuesday. It is in the Early English style, and is built of stone from Spy-law quarry, with overhanging roofs covered with red tiles. At the north side, and divided by a movable partition, is the schoolroom, which can be used as part of the chapel during the holiday season. A large classroom is also provided. The heating is carried out by Messrs. Emley and Son, of Newcastle. Messrs. J. Wilson and Sons, of Lesbury and Alnmouth have been the contractors for the new buildings, which have been carried out from designs by Mr. J. W. Taylor, of Newcastle. The building seats 310 persons.

CITY-ROAD, N.—The Wesleyan Chapel, City-road, was reopened on the 5th inst., after restoration, at a cost of £13,000, carried out under the direction of Mr. Elijah Hoole. The chapel is the metropolitan church of the Methodist Communion, the foundation stone having been laid by Wesley in 1777. The style is Roman Doric, and the structural changes now made harmonise with the original design. The plan is a simple square with a short eastern apse of Portland stone, the walls of the nave being of brick. In the apse the legends on the reredos have been removed, and in the place of the Decalogue and the Lord's Prayer there now appear the Apostles' Creed and the summary of the Commandments contained in St. Matthew's Gospel. The ceiling of the apse, the spandrels, and soffit of arch are of Roman mosaic. The ornate high reliefs which occurred above the reredos have been reproduced in alabaster. Within the apse a chair which belonged to John Wesley is now placed for the use of the celebrant. In the choir stands an organ, newly erected by Messrs. Brindley and Foster, of Sheffield. The choir stands on a raised floor of Venetian mosaic, with marble steps. In front of the pulpit there are a new oaken lectern and sedilia. The woodwork of the chapel is of unwaxed oak, the bench ends being carved in open panels, which contain the arms of the Wesley family. The new memorial, Mr. Adams Acton's bronze statue, is now in its place in the forecourt.

DROITWICH. — The Worcester Brine Baths Hotel, Droitwich, was opened on Wednesday last. The building is in the old half-timbered style, the materials used being brick, timber, and rough-cast, at a cost of £15,000. It is four stories high. In the centre of the hotel is the main entrance, with a *porte cochère*. On passing through the doorway, the visitor walks into a spacious hall, which is intersected at right angles by a lofty, well-lighted corridor 10ft. wide. On the right is the office, and on the left the manager's room, and before him is the main staircase. The coffee-room is 42ft. by 30ft., the ceiling being divided into six panels, which are enriched by cornices 3ft. 6in. in girth, which are picked out in eight colours, and the enrichments are gilded. The drawing-room, 40ft. by 20ft., is in two sections, being divided by an arch springing from two pilasters. Leading from this room is the ladies' writing-room. The total number of bedrooms is 96, and on the ground-floor, first floor, and second floor are six suites of rooms. The architect is Mr. John Robert Nichols, M.S.A., of 59, Colmore-row, Birmingham, and the contractor Mr. C. A. Horton, of Brierley Hill. The lifts are by Messrs. Waygood and Co., London, and the sanitary arrangements by Messrs. Doulton and Co., London.

PRESTON.—The foundation stone of St. Matthew's day-school was laid last week. On the ground floor is infants' room, 87ft. by 57ft. and 15ft. from floor to ceiling. On the west side are three large classrooms, running the length of the main room. The general arrangement of the ground floor is repeated on the first floor. This will be used by the girls, the height from floor to ceiling being 16ft. The present schools adjoining will be used exclusively for boys. All floors will be laid in white boards, and are to be constructed sound-proof. The walls will be plastered throughout, above a cemented dado. The architects are Messrs. Myres, Veevers, and Myres, of Preston and Westminster, and the works are being carried out under the supervision of Mr. T. Harrison Myres, by the local contractors; Mr. John Sergeant acting as clerk of works. The cost will be £3,000.

RAINHILL.—The Evans Memorial buildings and Congregational Church at the Holt, Rainhill, near Liverpool, were opened on Thursday in last week. The buildings have been erected at the sole cost of Miss Ruth Evans, in memory of her brother, to whose memory also Miss Evans is erecting church and school buildings at Haydock, and school buildings at Ashton-in-Makerfield, the total cost of the combined schemes, including land, being about £25,000. The whole of the buildings are approaching completion from the designs of Mr. Thomas Cubbon, of Birkenhead, the contractors being Messrs. Hughes and Stirling, of Liverpool and Bootle. The principal portion of the Holt buildings is the church, seating about 650, having organ-chamber, vestry, and cloak-room at the rear. The style is Late Gothic, the plan of the church being cruciform, having chancel and transepts. The clerestory is carried upon moulded arches and octagon columns of white Cefn stone, as are also chancel, transept, and organ-chamber arches. The buildings are faced externally with local red sandstone, and all the internal woodwork is of pitch-pine. The traceried windows are filled in with enriched lead-lights. A tower, with spire 120ft. in height, occupies the south-west angle of the main building. The Sunday schools consist of a large assembly hall, accommodating 300 children, and four classrooms, each for 18 scholars. There is also a swimming-bath, 50ft. by 23ft., having the sides lined with white enamelled bricks, and the bottom laid with white tiles, on a concrete bed. There are also a gymasium, clubhouse, and cocoa-rooms, with two reading-rooms on the first floor, and a residence for manager. The contractors for the gates and railings were Messrs. M'Farlane, of Glasgow. The cost of these buildings is over £10,000.

SUDBOROUGH.—The parish church of All Saints was opened on Friday, after restoration. The work carried out has been the entire re-roofing in oak of the nave, the south transept, and south aisle; the re-slating and underpinning of the north transept; the rebuilding of the south-east angle of south transept, and the replacement of one of the four pillars of the nave. The tower has also been re-roofed, the battlements raised, the pinnacles (of late date) renewed, and the walls repaired. The church has been refloored with wood blocks, and made level with the stone-work of the nave and aisles, and carved oak seats placed in the nave. In the chancel the flooring has been enriched by the introduction of stone and marble in place of tiles, and the prayer-desks and choir-seats are also of oak to correspond with those in the body of the church. The church is lighted with lamps from the design of Mr. J. C. Traylen, of Stamford, the architect of the whole of the work. The contractors for the restoration were Messrs. E. Roberts and Son, of Weedon.

WEST DULWICH.—The first section of the Church of All Saints in Rosendale-road was consecrated on All Saints' Eve. The church is being built in sections from designs by Mr. G. H. Fellowes-Prynne, of Torrington-square, W.C. The first contract included the foundations at the east end, which were carried out by Messrs. Kynoch and Co. The second contract, just executed by Messrs. J. and C. Bowyer, of Upper Norwood, includes crypt, chancel, chapel, vestries, north and south transepts, and four out of seven bays of the nave, the flèche and tower being, for want of funds, temporarily cut off at roof level. The site has a fall of 28ft. from west to east. The nave floor taking the western level, space is obtained for a spacious crypt for parochial and heating purposes. The church consists of a lofty nave 60ft. high and 40ft. wide and 128ft. in length, divided into seven double arched bays, the piers being built of red brick and stone. Panels for decoration are formed over lower arches, and a clerestory in spandrels above. The present section will accommodate about 1,000 persons.

St. Swithin's parish church, Walcot, Bath, was reopened, after restoration at a cost of £3,000, on Monday.

The foundation-stone of the public library to be built between Castle-street and Abbey-street, Carlisle, will be laid in January next. There will be accommodation for lending and reference libraries, reading-rooms, museum, lectures, and classes, picture gallery, and science and art school. The contracts have been obtained principally by Carlisle tradesmen, and the cost, with fittings, will amount to nearly £14,000. The architect is Mr. W. Howard Smith, the city surveyor of Carlisle.

Engineering Notes.

BRIGHTON.—The ceremony of setting the first pile of a new pier and marine palace for Brighton was performed on Saturday. The site of the new structure is opposite the Old Steyne. The Brighton Marine Palace and Pier Company have acquired the old Chain Pier, which is about 200 yards to the eastward, and this will be removed by the time the new pier is completed, about 18 months hence. The palace and the pier will be constructed from the designs of Mr. R. St. George Moore, M.I.C.E., and the contract is let to Mr. A. Woodhouse, of Newport, Mon. The pier will be 1,700ft. long, or about 500ft. longer than the present West Pier, and the palace at the end, capable of seating 1,500, will be utilised for high-class concerts and other performances. Dining and grill rooms, smoking and reading rooms will be erected. The total area of the pier-head, on which the palace will be erected, will be upwards of 48,000sq.ft., and surrounding the palace there will be a promenade, with sheltered seats. At the extreme end a landing stage will enable stamers to land passengers at all states of the tide.

THE INSTITUTION OF CIVIL ENGINEERS.—The president, Mr. George Berkley, delivered the opening address of the season on Tuesday night. The president traced successively the development of the engineering art in the Stone, the Bronze, and the Iron ages, and then referred to the colossal works of the Romans. In regard to the latter works, particulars were given of the most notable intra-mural aqueducts of ancient Rome, and a comparison was drawn between the water supply so furnished and that of the modern city, from which it appeared that the present population of Rome enjoyed a supply amounting to about 51 million of gallons, or 137 gallons per head for a total of 372,000 inhabitants. Reverting to the chronological sequence of his subject, the president showed that the most important factor in the development of engineering was the discovery by Watt of the expansive action of steam. As an instance of the influence of the general adoption of the steam-engine on all classes of engineering work, reference was made to the typical modern steam-vessel, which necessitated for its accommodation large docks, demanding in turn elaborate mechanical contrivances to insure their utilisation. Thus the docks of Liverpool and Birkenhead possessed a quay-space of upwards of 33 miles, and a frontage to the Mersey of nearly 12 miles. Closely connected with works of dock-engineering was the revival of inland navigation, as instanced in the Ship Canals now being constructed in various parts of the world. The president then gave some particulars of the present state of engineering in America, dwelling particularly upon the production of iron. The present output of pig iron in the United States was 10,000,000 tons, or 2,000,000 tons greater than that of the United Kingdom. The whole of this production being utilised in the country resulted in a consumption of 300lb. of iron per head of population, exceeding that occurring in any other part of the world. The president gave statistics of the railways and bridges of the United States, in the latter case selecting for illustration four works typical of different modes of construction—namely, the St. Louis Bridge of the Mississippi, the Brooklyn Suspension Bridge and the Washington Bridge, both at New York, and the cantilever bridge carrying the Michigan Central Railway over the Niagara River below the Falls. Reference was next made to the position now assumed by electrical engineering in its modern developments, especially as concerned the transmission of energy to great distances.

TWYFORD.—On Monday afternoon the new bridge over the Itchen at Twyford was tested and opened to the public. The engineer is Mr. James Robinson, C.E.; his assistant, Mr. W. J. Taylor, A.M.Inst.C.E.; and Mr. A Thorne is the contractor. The concrete foundations of the new bridge are carried down about 4ft. 6in. below the bed of the river, to get a good bottom, and to avoid the possibility of the water scouring them out, and on these rise the solid brickwork supporting the platform of the bridge, which consists of corrugated steel, the corrugations being a foot in depth, securely riveted to each other, and filled up with concrete, which gives great strength, and is an economical method of construction. The parapets are of wrought iron, with ornamental scroll panels resting on cast-iron arches, and this light construction over the spans is judiciously balanced by solid brick wing walls, with stone caps, whilst the easy approaches contrast very favourably with the dangerous ones to the old structure. The test on Monday afternoon was effected by driving a heavy traction-engine over the bridge at various speeds, and gauging the deflection caused thereby by means of sliding rods underneath. The greatest deflection thus registered was 1-16in., which compared with the Board of Trade allowance for railway bridges of $\frac{3}{4}$in. to every 100ft., shows a very satisfactory result, and the engineer and members of the Board expressed themselves perfectly satisfied with the way in which the work had been done by the contractor, through the medium of his representative, Mr. Frank Proctor. A view, in platinum, of the testing, together with this record is to be built into the pier behind the inscription stone.

CHIPS.

It has been decided to apply, in the next session of Parliament, for powers to construct extensive new docks at Cardiff on the east of the old low-water pier coming out near the orchards. This is the adoption of Mr. Abernethy's old scheme.

On Sunday week the memorial pulpit recently erected in the abbey church of Romsey was dedicated. The pulpit is made of carved oak, semi-circular in shape, and has nine panels to it, and in four of these are placed carved oak figures of the Evangelists. The pulpit is supported by nine oak pillars. Mr. George Wheeler, builder, of Romford, executed the work.

At the office of the Local Government Board, on Friday, Mr. Ritchie received a deputation from the local boards of the West Riding of Yorkshire, protesting against the proposal of Leeds and Bradford for the appointment of a joint conservancy board for the rivers Calder and Aire. The deputation was in favour of a separate board. Mr. Ritchie said the West Riding county council had the power in their hands, and he should certainly not willingly, or without a great deal of argument and pressure, be one to take out of the hands of the county council any portion of their authority.

The school board for St. Just-in-Roseland have adopted plans by Mr. Silvanus Trevail, M.S.A., of Truro, for schools to be built at St. Mawes to accommodate 267 children, with teacher's residence, and a school for 80 children at St. Just.

The Royal Cambrian Academy exhibition at Plas Mawr, Conway, closed last week after a very successful season. The total amount of sales was £2,352.

The Manor Club and Institute were recently opened at Merton, near Wimbledon. The reading-room on ground floor is 25ft. by 30ft., and above is a lecture hall of similar dimensions, and 20ft. in height. The walls are of yellow bricks with Bath stone and red brick dressing. Mr. Quartermain is the architect, and the work was carried out by the estate workmen, Mr. Priestley being the foreman. Messrs. Dennett and Ingle executed the iron flooring, and Messrs. Gregory and Co. laid the wood-block paving; the cost has been £3,000.

Among the new mayors elected on Monday are Mr. Arthur Vernon, J.P., architect, at Wycombe; Mr. James Lemon, F.R.I.B.A., M.Inst.C.E., at Southampton; and Alderman George Kett, J.P., of the firm of Rattee and Kett, carvers, at Cambridge.

The fourteenth annual exhibition of the Royal Scottish Society of Water-colour Painters in Glasgow was opened to the public on Saturday evening.

A receiving order has been granted in the case of James Greenwood, trading as James Greenwood and Son, of Sutton, Maltby-street, Bermondsey, and Cannon-street, E.C., builder and contractor.

The Le Dansk margarine factory at Northam, near Southampton, was inaugurated last week. It has been built from plans by M. E. Brunnarius, of Paris, the contractors being Messrs. Reed, Blight, and Co., of Sutton Harbour, Plymouth. The internal walls are lined throughout with white glazed bricks with blue bands, brought from Paris, and the floors are of composite iron and concrete, packed with silicate cotton between the concrete and the flooring.

Dissolution of partnership is announced between B. Lucraft and Sons, Northport-street and Grange-street, Hoxton, cabinet-makers and upholsterers; as far as regards J. Lucraft.

At Pearl-street, Cardiff, on Wednesday week, the memorial stones of a new Baptist chapel were laid. Mr. Justin Hutchings, of Newport, is the architect, and a contract has been entered into with Mr. Augustus Lewis for £1,265.

addition to being thus far removed from al
this method of construction possesses the f
advantage of much greater durability as
the woodwork is concerned, as neither the
nor girders are anything like as much exp

is in the usual plan. I have known the joists completely rotted off in less than rs from wall-damp. In such cases, in- new joists is never a pleasant, and is nes a dangerous operation. On the other when it is necessary to renew a corbel ; is a comparatively easy job. I have used in a story-and-a-half cottage wall of only hickness quite successfully, but should not m on *egg-shell* town houses. With fairly tial walls I should adopt the plan of on corbels.—I am, &c.,

EX-CIVIL ENGINEER.

BELGIAN SCULPTURE.

—We see in an edition of your paper of t last, a description of the visit paid to our by some of the members of the Society of ects during their tour in Belgium. We at several critics are hardly fair in their ent, and consequently would thank you to us to reply through the columns of your le paper.

We are accused of treating our statues oo much simplicity. To this we beg to at we have been taught by the masters of ique that the great beauty and dignity s in the simplicity of the line.

We are informed that our work does not finished enough. To this we beg to at we never employ glass-paper, but in- showing in all our statuesque work the f the chisel, and we consider this is the tistic treatment possible.

We never "plant on" any ornament it is absolutely ordered by our clients, for ke of cheapness, and even then we do it ntly.

It is very necessary to point out the nce of labour between the two countries. m being a very cheap country for living, ne fact that some of our sculptors have ith us for over forty years, ought to be enough that our hands feel happy with Ve thought we could not let pass entirely cription of your correspondent without ind of protest. At the same time we are to thank the members of the Society of ects who honoured us with a call, and we always feel proud and happy to receive or their friends on their visit to the ent. Thanking you for having kindly d our remarks in your columns,—We are,

J. A. GOYERS, FRERES.

vain, 5th November.

A CORRECTION.

—We notice in your issue of the 7th inst., in the list of tenders for Castlefields Mills s. Coulthurst and Booty, architects), you ur tender as £1,940. You have been mis- ed upon the point, as our estimate for this of the work was £1,000. We shall be by you correcting this in your next issue.— e &c., WALKER AND SLATER.

xeter Old-road, Derby, Nov. 10.

QUESTIONS.

[10661.]—**Pargetter.**—Will any of your readers inform me if the word pargetter is used in this country for a plasterer, or pargetting for plastering?—ROBERT PHILLIPS.

REPLIES.

[10642.]—**Strong Room.**—If air bricks discharge outside, the extraction flue is not required, but strong rooms are sometimes placed with rooms around them, and the air bricks have to discharge the air inside under the arch. As the arch is generally a barrel, the extraction flue is placed as high up in the segmental part of the end wall. Its use is to allow the escape of the expanded and heated air in case of fire overheating the walls. The gas inside is dangerous, and as matches are used and thrown about, it is much better kept outside. A leaky stop-cock may allow enough gas to escape to form an explosive mixture. The lamp would hang on the shutting side of the door, and I have never had complaints of their being troublesome.—ROBERT PHILLIPS.

[10653.]—**Wainscotting.**—I am of opinion the builder is not bound to put oak except it was specially named. Wainscotting is the wall panelling reaching from floor to ceiling, as distinguished from dado, a panelling only reaching part of the way. Wainscot oak obtained its name from being used for this purpose, but it is more properly described as brown Riga oak.—ROBERT PHILLIPS.

[10653.]—**Wainscotting.**—Parker, in his "Glossary," says, under "Wainscot": —"This term originally seems to have implied rough planks of oak timber, and subsequently to have been given to wooden panelling, to which they were converted, for lining the inner walls of houses and churches. It was very extensively employed during the reigns of Queen Elizabeth and James I., and for a long period afterwards. The name has long ceased to be confined to *oak* panelling." The italics are in the original. The old wainscotting in many of the Hotel de Villes in Belgium, visited by the Society of Architects, was found to be of deal. Much, if not all, of the wainscotting at Holyrood Palace is of deal.—HARRY HEMS.

[10634.]—**Brick as a Building Material.**—In sandstone or any other laminated stone it is absolutely necessary to lay every course with the inside edge of the wall higher than the outside; in lime and clay stones it is not necessary. In exposed situations in the North I have seen buildings with every face stone worked to a set stock or bevel. Every stone wall should have a brick lining, or it will be so cold that damp air will condense on it and give the appearance of dampness. In the last century they battened and lath-and-plastered inside to prevent this. In high walls, the line being on the top edge of the brick, there is a tendency to slightly cant the brick outwards to meet the line, making the wall higher on the inside edge.—ROBERT PHILLIPS.

[10657.]—**Timesing and Dotting on.**—Mistakes often occur in squaring dimensions of this kind. The rule I adopt is to begin at the right-hand side of the "timesing." The first dimension would therefore read $2 \times 2 + 2 = 6$. Take another example—

$$2 \cdot 4/3 \cdot 2/\tfrac{1}{2}/ \quad \begin{matrix} 5 & 0 \\ 3 & 0 \end{matrix}$$

This would be worked thus—

$$\begin{matrix} \frac{1}{2} \times 2 = & 1 \\ 1 + 3 = & 4 \\ 4 \times 4 = & 16 \\ 16 + 2 = & 18 \\ 18/\ 5\ \ 0 & \\ 3\ \ 0 = & 270'\ 0'' \end{matrix}$$

—CHAS. W. BELL, Southsea.

[10660.]—**Joists, Purlins, and Rafters.**—The formula for common joists is:—

$$D = \sqrt[3]{\frac{L^2}{B}} + 2{\cdot}2$$

Where L = length in feet, B = thickness in inches, D = depth in inches; or, divide the square of the length in feet by the thickness in inches, and the cube root of the result multiplied by the constant for fir gives the depth. For example: Take a bearing of 15ft. and a thickness of 3in.; $15 + 15 \div 3 = 75$; cube root of $75 = 4{\cdot}2$; $4{\cdot}2 + 2{\cdot}2 = 9{\cdot}24$, or a 3 + 9 deal. Formula for purlins:—

$$D = \sqrt[4]{L^3 C}$$
$$B = 0{\cdot}6\ D$$

Where B = thickness in inches, D = depth in inches, L = length in feet, C = distance apart; or, multiply the cube of the length of the purlins in feet by the distance apart in feet, and the 4th root of the product will give the depth in inches. The depth multiplied by 0·6 gives the thickness. For example: Take a bearing of 10ft. and a distance apart of 6ft.; $10^3 + 6 = 6{,}000$; $\sqrt[4]{6{,}000} = 8{\cdot}8$; $8{\cdot}8 + 0{\cdot}6 = 5{\cdot}2$, or, in round figures, a scantling of 4in. by 9in. Formula for common rafters 2in. thick:—D = ·57 L. Where D = depth in inches, L = length in feet. For example: For a bearing of 6ft., $6 + {\cdot}57 = 3{\cdot}42$, or a 2in. by 3½in. rafter. In working out scantlings for ordinary roofs it is as well to take stack thicknesses, such as 2in., 3in., 4in. In practice the above formulæ are seldom used. Experienced men carry in their heads approximate scantlings for all ordinary purposes.—ILTYD.

A firm of engineers have this week completed for the directors of the North Cornwall Railway a survey of a projected extension from Padstow to Newquay, viâ Bedruthan Steps and Mawgan.

Mr. David Laidlaw, the head and founder of the firm of Laidlaw and Sons, of Edinburgh and Glasgow, water and gas engineers, died last week, at the age of 82.

Legal.

ARCHITECTS' AUTHORITY.—II.

AFTER the contract has been signed, it is clearly the duty of the architect to carry out that contract in all its parts fully, and in good faith, having regard to the interests of his employer or client, the building owner. He has no general power to alter, vary, or revise any of the conditions of that contract, because, whatever might have been his legal position as a skilled agent acting for the owner before the contract was signed, he is afterwards bound by the special clauses and conditions of that document. Of course, all these can be varied or waived by the parties themselves, as can the clauses of any other agreement; but unless and until this is done, or the architect is expressly empowered to allow such alterations, his authority is limited to carrying out that contract itself. There may, of course, be, and there often is, a clause in the contract enabling the architect to give directions as to the works; but these directions can only operate within the limits of the document, and cannot have any effect in altering or modifying the whole scheme or scope of the contract as adopted by the parties. The authority of the architect is entirely based upon his agency as standing in the place of his client, the building owner. This is the principle at the root of the whole question, and the builder is equally bound to regard the contract as limiting the architect's authority in all particulars to which it relates. It is, therefore, no use whatever for a builder to try and make the owner responsible for works ordered by an architect which are outside and beyond the contract, and which he has only executed in reliance upon the representations of the architect that he was specially empowered by his client to give such orders. It is obvious that proof, however cogent, of the architect's statements in this respect, cannot avail the builder as against the owner in the face of the claims and conditions of the contract itself, by the words of which all are bound. If a builder has been thus misled, his only legal remedy would be by action against the architect personally.

FRED. WETHERFIELD, Solicitor.
1, Gresham Buildings, Guidhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

C N. B.—WATER COMPANY REGULATIONS.—The water company can, when directed to furnish a constant supply of water, compel the consumer to put in an outside stop-valve at his expense; and this although he may have a valve already in his house. The company are entitled to have the valve under their control, which could not be if the valve inside the house were to be taken as sufficient. (2) The Act mentioned would, I think, apply to houses existing at the date of the Act. At least, it has always been worked on that footing, so the company are entitled to give the order mentioned.

J. N.—CHARGES FOR PLANS, &c.—As the plans, specifications, &c., were not used owing to fresh ideas being introduced, and different plans, &c., being required (for which the proper percentage will be paid), I think the way to get at the charges for the disused plans would be to arrive at the time spent on them, charging a proper sum per hour. Add to this the out-of-pocket expenses, and—say five per cent. on the total. This rule, or something similar, has often been adopted in cases like this, and juries have supported the charges; but, after all, a professional man is the best judge of what his work ought to be worth, and he ought to charge what he can reasonably justify.

PROVINCIAL.—ENCROACHMENT.—It is understood that the building with eaves projecting was part of the premises leased. That being so, the neighbour taking off the eaves and erecting a building with gutter on your building would, without consent, be a trespass. If it were allowed for the years mentioned without protest and without recognition of the trespass by him, it would practically become an easement; but you would be liable in the terms and covenants of the lease to the lessor for damages. Give, say, a month's notice to abate trespass, and remove the encroachment. The legal position may not be raised; but if it is, it would be wise to come to some arrangement in which the lessor would join.

A. D —AGREEMENT.—EXTRAS.—An agreement is signed to build houses according to plans and specifications, and you further agree "to carry out the work in detail, or as may be arranged to the satisfaction of the owner." Now you are desired to shift windows after the casings are up and fixed, build the houses higher, put in extra skylights, and so on, and for this the owner refuses to pay. I should say he is liable for these as extras, as they were clearly not contemplated in the agreement, and are beyond it. The words "as may be arranged" must mean something *consistent* with the plans and specifications.

The partnership heretofore subsisting between Messrs. Brown and Pritchett, of Limpsfield, architects and surveyors, has been dissolved.

Our Office Table.

Mr. Norman Shaw, R.A., in a letter to the *Times*, defends the position taken up by the memorialists who protest against the changes now in progress at the Institute of British Architects, by which it is being attempted to transform architecture from an art into a close profession by the introduction of a system of examinations and diplomas. He bluntly remarks that "the views of the Institute and of the memorialists are too entirely opposed to be reconciled by bland appeals and pointless platitudes of the President's address." As to Mr. MacVicar Anderson's classification of architects as artists, constructive geniuses, and men of business, Mr. Norman Shaw contends that the men in the last two divisions are, as such, not architects at all—the scientific constructor already existing in the engineer, the business man in the man of business. He asked whether the Institute's line of action in examining all students indiscriminately, and extending to all the same diploma, "does not indicate only too plainly that the Institute, while professing to protect the public, is attempting to protect the architects; that it has never cared about art at all, but has expended such force as it has entirely on professionalism—that is, on the manufacture and protection of architects who shall be members of the Institute, rather than on the help and furtherance of the art of architecture?" The weak point in the memorialists' case is that they do not show how qualified architects are to be differentiated to the public from these pretenders, except by examination, which logically must be followed by registration. If competitions are inventions of the evil one, and examinations a sham, how is the budding genius to convince the public that he is sufficiently qualified to be intrusted with a first commission? Is any carpenter or undertaker to be entitled, as at present, to add "architect" to his list of ocupations, on the assumption that he possesses, in a latent state, the talent and artistic qualities which, as Mr. Shaw says, "make a man an architect"?

Mr. William Woodward, in his reply to Mr. Shaw, suggests another practical point of interest to art-architects—is the public willing to pay further commissions to the engineer-specialist and to the practical man, in addition to the 5 per cent. charged for the "art" portion of the building, or will it not demand that the architect shall prove himself to be a well-qualified all-round professional adviser?

The death of Mr. John Thornhill Harrison, for the past twenty years one of the engineering inspectors of the Local Government Board, will be noted with regret by many of our readers in all parts of the kingdom, who will bear testimony to his patience and courtesy in conducting local inquiries. Mr. Harrison was born at Thornhill in 1815. He was educated at Edinburgh University, and, on leaving, was articled to his brother, the late Mr. T. E. Harrison, who for so many years was associated with the North-Eastern Railway as chief engineer. In his younger days, Mr. J. T. Harrison worked under Brunel in the construction of the Great Western Railway; but afterwards relinquished engineering for agriculture. He was appointed a member of the first Rivers Pollution Commission, and in 1871 obtained the appointment under the Local Government Board, which he held until his death, which occurred at Ealing on Wednesday week. The deceased was a member of the Institute of Civil Engineers and a Fellow of the Geological Society, and to both these bodies he contributed many papers. Mr. Harrison leaves a widow and one son. By his death an inspectorship of £900 a year is placed at Mr. Ritchie's disposal.

The Art Gallery at Wednesbury was formally opened last week. The institution had its origin in the bequest, some six years ago, of more than 300 paintings, water-colour drawings, and engravings by Mrs. James Richards, of Wood Green, Wednesbury, with pecuniary legacies to the amount of £3,500, £2,000 being towards the cost of the building, £1,000 to form an endowment fund to provide for the salary of the curator, and £500 to defray the cost of re gilding the frames and framing such of the works as needed it. That led to the erection of the gallery now opened, and the collection has been supplemented by the gift or loan of some 300 other oil and water colour pictures, which fill the wall space of the four rooms and overflow on to the staircase. The nucleus, the Richards' collection, includes a forest scene, with Windsor Castle in the distance, by the late F. H. Henshaw (1873), to which the place of honour has been given, and works by Williams Leader, F. R. Lee, John Linnell, Henry Dawson, Henry Moore, Baxter, Marcus Stone, F. Goodall, G. B. O'Neill, George Cole, J. B. Burgess, John Pettie, J. M'Whirter, Mark Antony, Sidney Cooper, F. Danby, A. Elmore, Kenny Meadows, F. G. Cotman, H. Köekköek, and others. Among the water-colours are examples of Birket Foster, David Cox (two studies on rough paper), Samuel Prout, and Sam Bough. The building adjoins the Town-hall, and is Renaissance in style, the facing materials being Stonebridge bricks and terra-cotta dressings. Messrs. Wood and Kendrick, of West Bromwich, were the architects, and Mr. H. Willcock, of Wolverhampton, was the builder.

In consequence of the success of the Exhibition of Antique Carpets held in Vienna some months ago, the Austrian Government has decided to publish a permanent record of the collection, and for this purpose 150 typical examples have been selected. Monographs will be contributed by the leading European experts, and Mr. C. Purdon Clarke, C.I.E., F.R.I.B.A., Keeper of the South Kensington Art Collections, has been invited to write the general summary on this work. Mr. Clarke, who has enjoyed the advantage of having studied the subject at the places where these gems of textile art were anciently produced—in Spain, Turkey, Syria, Persia, and India—will also edit and translate the English edition, the plates of which are to be printed on white satin.

The thirteenth annual report of the City and Guilds Institute on the examination in technology states that there is a much larger increase in the number of papers examined and of passes this year than in the two previous years. At the recent examination the total number of worked papers was 7,416, as against 6,781 in 1890. This year, too, there is not only an increase in the number, but also in the proportion of candidates who have succeeded in satisfying the examiners, the number of passes being 4,099, as against 3,507 in 1890, and the percentage of passes 55·3, as against 51·8. Examinations were held this year in 53 subjects, as against 49, and in 245 different centres throughout the country, as against 219. The increase since the foundation of the institute in 1879 has been almost continuous, and this year's numbers are the largest yet recorded. There has been no break in the continuous increase in the number of candidates in the subject of Plumbers' Work, the numbers being 547 in 1889, 569 in 1890, and 684 in 1891. The failures in this subject are always large; but the percentage this year is slightly lower, being 56·7 as compared with 59 in 1890. In Carpentry and Joinery there is an increase in the number of candidates from 707 to 837, and an increase of passes from 442 to 539. In Brick-work and Masonry the number of candidates has increased from 120 to 179, the percentage of failures this year being 30·1.

A special meeting of the Limerick committee for the National Registration of Plumbers was held the other day, under the presidency of the Mayor of Limerick, supported by the City High Sheriff, Dr. Barry, the corporation medical officer of health, and others, to consider a draft bill for legalising the registration system. The hon. sec. to the committee read the draft bill, and explained that in principle it aimed at giving legal sanction to the work already done, and conferring upon a general council the powers and control already exercised by the various district councils and the Plumbers' Company. Limerick was one of the cities in Ireland scheduled in the bill to elect representatives on the general council. After full discussion, on the motion of Dr. Barry, seconded by Mr. Fogerty, the following resolution was passed:—"That this meeting of the committee for Limerick and district hereby approve of the principle of the bill drawn up by the Worshipful Company of Plumbers, London, to define and legalise the system for the National Registration of Plumbers." The Mayor, in replying to a vote of thanks for presiding, said he was particularly happy to be able to render assistance to a movement so closely connected with the public health.

The well-known business of Mr. James Hill, Queen Victoria-street, has just attained its majority, and the event was celebrated on M day, the 9th inst., at the Holborn Restaur by a dinner. Mr. Hill occupied the chair, there was a large gathering of friends employés. A very pleasant evening was sp the usual toasts being interspersed with so musical sketches, &c. The principal toast "Success to the Firm," and this was suit responded to by Mr. Hill and his junior partn Mr. How and Mr. King.

LEGAL INTELLIGENCE.

Recovering for Unused Plans.—In County Court, Canterbury, on Nov. 3, C. H. Rosher, a civil engineer, of Croydon, Mr. T. G. Browning, an auctioneer, of W stable, for a sum of £40, in respect of plans proposed baths at Whitstable, of which defen was the promoter. The case was tried by Honour Judge Selfe and a jury. Mr. Julian Ro barrister, appeared for plaintiff, and Mr. Milne, rister, for the defendant. The defendant, ha seen an advertisement of the Rainbow Engine Company, having reference to the "Rosher tem" of heating swimming-baths, addresse inquiry to them on the subject. Mr. Rosher down, as the representative of the company, o 14th of March, and, learning that no plans been prepared, explained that he only came as the patentee of the system, but that, ha special knowledge of bath buildings, he woul pleased to get out the plans. Accordingly fendant gave him instructions to prepare p which were duly approved. Ultimately, a pany was formed to carry out the baths sch and another architect was appointed. The fendant repudiated his liability to pay Mr. Ro alleging that the latter had undertaken the wo a speculation, which he stated was a course quently taken by architects and engineers. view of the case was emphatically denied b plaintiff, who, in a letter to the defendant, that he objected to become "a blackleg to his fession." Mr. Theodore Barker, F.R.I.B.A., evidence on behalf of plaintiff as to the reason ness of his charges; but it appeared that the tiff had at one time offered to settle the disput a sum of £15 15s., and in the end the jury awa him £15, and the judge allowed this verdi carry costs on the higher scale.

Re Westminster Improvement Commissio —Mr. Justice Chitty made an order on Saturd the winding-up of the affairs of this body. commissioners were incorporated under an A 1845 for the purposes of an undertaking comp the construction of certain streets, works, an provements. The order now made was the provisions of a special Act of the past sessi

The Charge of Fraud Against an Archi —At the Teddington session on Tuesday, A M. Leach, architect and surveyor, of the Lo Joint Stock Bank-buildings, Smithfield Market Henry Cave, a coffee-house keeper, of Bermon were brougth up, for the sixth time, charged having conspired with a man named Adan defraud the Liverpool and London and Insurance Company of £550. The magistrates mitted both prisoners for trial, and refused bai

Charge against an Architect.—At the Ch ham Police-court on Friday, John Taylor Ma architect, of Newport, Mon., was charged having given a false name and address to Ri Attenborough, pawnbroker, and also offer diamond ring, value £10, to William Har Kent, and refusing to give a satisfactory accou the means by which he came possessed of Defendant admitted that he gave the wrong and address, and was fined £3.

District Surveyors' Fees for Flats.—M Williams.—(Court of Appeal, Nov. 10. the Master of the Rolls and Lord Justices Fr Lopes.)—The appellant was the surveyor und London County Council of the district in whi respondents have recently erected a large bui seven stories high, known as Kensington C gardens, which consist of a number of flats one roof that are let as separate tenement having one common entrance from the street. appellant contended that he was entitled statutory fee in respect of each tenement, whi alleged, constituted a separate building with meaning of the Metropolitan Building Act. magistrates decided in his favour, but the sional Court reversed the decision. The d surveyor appealed.—Their Lordships dismiss appeal, being of opinion that the Act contem that each building must have a separate roo that a district surveyor was not entitled to fees in respect of separate flats, even althoug might constitute separate dwellings.

AND ENGINEERING JOURNAL.
VOL. LXI.—No. 1924.

FRIDAY, NOVEMBER 20, 1891.

NDON BUILDING LAW (CONSOLIDATION) BILL.

VE have before us a copy of the Draft Bill which the Local Government rd will introduce next session, the object which is to consolidate the Metropolitan ilding Acts and certain sections of the ndon Council (General Powers) Act, 1890, latter of which we gave our readers a *umé* some time ago. Of the necessity l value of consolidating the Acts affecting lding in the Metropolis we have quite ently spoken. It is something to be able ake up the Act and find by reference to particular subject what the law really is, the purport of the statuary clauses belong- thereto, instead of having to wade ough all the amendment Acts. We will it our remarks now to a general examina- n and comparison of the Draft Bill with old Acts, pointing out the interpolated uses. To our Metropolitan readers commend a careful study of the ble of Sections of the Acts proposed be repealed with the corresponding uses of the Bill. From this table it will seen that the first section of the old Acts been transferred. Thus, the "Interpretation of Terms," section 3 of the 18 & 19 t. c. 122, is transposed, and is numbered of the clauses of the Draft Bill. These initions gather up all those under the & 19 Vict. c. 122 and 41 & 42 Vict. c. 32, 14. Sections 7 to 11 of the 18 & 19 Vict. ve been recast as regards the application the Act to old buildings. Thus, instead of tion 10, it is enacted that when any old ilding has been taken down to an extent eeding one half as measured in cubic feet, rebuilding of such part shall be deemed new building, "and the old as well as the w part shall be subject to the said pro- ions." The original clause only made the t applicable to every portion of the old ilding that was not in conformity with the gulations of the Act. Therefore the pro- ed regulation will make it compulsory to e down the whole building, if necessary. We next come to the structure and thick- ss of walls, section 12 of the old Act. is section is numbered 1 in the Draft Bill, l commences Part I. of the "Regulation Supervision of Buildings." Clauses 1 to 18 low in consecutive order the original tions 12 to 29. In comparing the new h the old clauses, we find no substantial ference except verbal emendations, as in substitution of the negative particle "not" "no," which is perhaps clearer and more mmatical in form. The proposed re- angement of clauses 1 to 18 includes the tructure and thickness of walls," the rules "recesses and openings" and "general gulations" as to timber in external lls, bressummers, rules as to height of lls above roofs, chimneys, &c. One addi- n is made to the rules as to close fires and es (section 21 of present Act), by which y are not to apply to pipes for "convey- hot water or steam at low pressure," see tion 10. In the rules as to habitable ms (12), a sub-clause (*c*) is introduced, ich refers to underground rooms, which to be constructed as directed by the blic Health (London) Act, 1891. These visions we have already given in our ice of this Act. The rules as to the aration of buildings (clause 16) and their ical contents have been brought together e (see section 27, 18 and 19 Vict., 23 l 24 Vict. section 2, and 53 and 54 Vict. section 29). A sub-clause provides that where the County Council are satisfied, on the report of the superintending architect and the chief officer of the Fire Brigade, that additional dimensions are necessary for the purpose of any trade or manufacture not involving the use of explosive or inflammable materials, and are satisfied that proper arrangements have been made for lessening danger from fire, such additional dimensions may be given, provided that such building shall not contain a number of cubic feet exceeding 450,000, or any less number allowed, without being divided by party walls, and such consent shall not be given in the case of any building exceeding 60ft. in height.

Clauses 18 and 19 of the Bill are important, as they incorporate the main sections of the old Acts relating to open spaces near dwelling-houses, and the limits of height of buildings. Thus section 29, 18 and 19 Vict., which provides that every dwelling-house shall have in the rear or side thereof an open space of at least 100sq.ft., unless the rooms can be lighted and ventilated from adjoining street or alley, is followed by sections 14—25 of the Metropolitan Management Amendment Act, 1882, which provide an open space in the rear of every building erected on a site not previously occupied according to the frontage of the said building. These provisions do not extend to certain buildings in Lincoln's and Gray's Inns and Inner and Middle Temples. We are surprised that advantage has not been taken to increase the areas in both cases provided. For instance, the frontage of a building as a governing factor allows the erection of lofty premises with but the same open space in the rear as those of only two stories. The area allowed gives, in the majority of cases, 10ft. in width of area from back to front, a space quite inadequate for ventilation, especially when a building of several stories is erected. Also the Bill still allows building over this limited area up to the level of the ground-floor story ceiling.

Clause 19 in the new Bill provides a limit of height of 90ft. It runs, "A building (not being a church or chapel) shall not be erected of, or subsequently increased to, a greater height than 90ft. (exclusive of two stories on the roof and of ornamental towers, turrets, or other architectural features or decorations) without the consent of the County Council." Now, this clause will permit many buildings to be erected of considerably greater elevation than 100ft. The two stories in the roof will allow of a steep Mansard of perhaps 18ft. or 20ft. in addition to any architectural features. Why exempt two stories in the roof, which are quite as, if not more, risky in case of fire than those inclosed by walls? If the word "inclusive" had been used the limit would be much more reasonable, and Captain Shaw's recommendation as to height have been more satisfactorily complied with. The regulation of height by the width of the street is a more reasonable rule, and is that which at present limits the height of buildings, except churches and chapels, on new streets of less width than 50ft. by the 25 and 26 Vict., cap. 102., sec. 85. The other new sub-clauses determine that the height shall be taken from the level of footway in front of façade, or from the natural level of the ground before excavation, to the level of top of parapet or wall, or to the base of gable, as the case may be; that the rule is not to apply to a building contracted for before the 18th day of August of last year, nor prevent the rebuilding of any building existing at that date to the same height as before.

When there is a block of building exceeding the height prescribed, it is permitted that any building in the same block may be carried to the original height of the block. A fine of £100 is imposed on any person who contravenes this section, and it is provided that notice of any consent to build to a greater height must be published within one week in a London daily newspaper, and the consent is not to be acted on until 21 days after such publication; also that any owner or lessee to whom consent has been refused, and any owner or lessee of building or land within 100 yards of the intended building who may be aggrieved by the grant of consent, may, within 21 days after refusal or publication of notice of consent, as the case may be, appeal to a tribunal of arbitration, which may confirm, reverse, or vary the refusal or consent.

The subsequent clauses of the Draft Bill numbered 20 to 40 relate to district surveyors, notices to them, their powers of enforcement, fees and salaries, and returns of surveyors, and these clauses correspond with sections 31 to 54, with few exceptions, of the old Act. The verbal alterations made to certain clauses are, on the whole, improvements. The powers of County Council (sections 41 and 42) are practically the same as those which we find in the old Act, sections 55, 61. The Council may alter, with the consent of Her Majesty in Council, the rules for the thickness of walls. An application is to be made to the County Council by persons who desire to erect iron buildings, or those to which the Act is inapplicable, and if satisfied with the plan submitted, they may give their approval; but they may not authorise any warehouse or building used wholly or in part for purpose of trade or manufacture to be erected of greater dimensions than 216,000 cubic feet, except in accordance with certain provisions under clause 16. Sub-clauses give power to the Council to issue general rules as to applications, and provide that the expenses incurred in obtaining approval shall be paid by the builder to the superintending architect, and that copies of plans and publications approved be furnished to the district surveyor.

The next clause, 43, includes the provisions as to control of certain temporary buildings in sections 12, 25 of the Metropolis Management, &c., Amendment Act, 1882. The Council is invested with powers to enter and remove or take down any building not erected in compliance with the requirements. Sub-clause 3 is certainly a clearer and more concise statement than that of the present section. Clause 44, relating to temporary wooden structures, provides that any wooden "erection of a movable or temporary character" (unless it is exempt from the operation of the Act) shall not be set up without a license from the County Council. Substantially this clause is the same as section 13 of the above Act.

Passing over clauses 45 and 46, which refer to the appointment of superintending architect, clause 47 gives power to the County Council to make by-laws with respect to sites and foundations as enacted by the Metropolis Management and Building Acts Amendment Act, 1878. Comparing the sub-clauses or matters for by-laws, we find one of them has been recast in a more concise and consolidated form, as that referring to foundations and sites; two others are added, one referring to the description and quality of the substances of which plastering may be made, and the other the "mode and materials in and with which any excavation made within a line drawn outside the site of house, building, or other erection, and at a uniform distance therefrom of 3ft., shall be filled up." Clauses 48 and 49 embody in more concise terms the sections 17 and 18 in the above Act of 1878, referring to proceedings on non-compliance. The power to appeal is given to any person within seven days after notice has been served, and all such appeals are to be conducted in accordance with sections 211 and 212 of the Metropolis Management Act, 1855,

and section 29 of the Metropolis Management Amendment Act, 1862.

Part II. on Party Structures (now Part III.) includes clauses 50 to 63 of the proposed Bill. Referring to the old Act of 1855, we find sections 82, 83 have been followed. A few verbal alterations have been made in the rules as to the exercise of rights by building and adjoining owners. Thus Clause 53, instead of old sub-sections 4 and 5, as recast reads thus: "Within one month after receipt of the said notice, the adjoining owner may serve on the building owner a notice requiring him to build, or may himself build on any such party structure any works to the construction of which he is hereinbefore declared to be entitled. The last-mentioned notice shall specify the work required by the adjoining owner for his convenience, and shall, if necessary, be accompanied by explanatory plans and drawings."

The additional provisions as to arbitration in the Metropolis Management, &c., Amendment Act, 1882, are incorporated and are practically the same as found in section 21 of that Act. These clauses refer to the appointment of a third surveyor in case of refusal to act, or death of one of the surveyors appointed by the owners, and thereby provides for any contingency that may arise. Clause 55 gives power to building owner to enter premises, as in the old section 86; and clause 56 provides for security to be given by building owner, as in old section 87. Then follow the rules to be observed (clause 57) as to expenses in respect of party structures, as given in the old Act, sect. 88. The remaining clauses of this part of the new Bill practically follow the old sections of the Act. The next Parts III. and IV. of the Bill refer to Dangerous and Neglected Structures and Supplemental Provisions, to which we must refer in another article. By the rearrangement of the old sections, and the bringing together, under their proper heads, the provisions of the original and amending Acts, those who practise in the Metropolis will be saved much wearisome and laborious reference. On the other hand, we should have liked to have seen a few more amendments in those sections relating to structure.

PROFESSIONAL DISAGREEMENT IN MATTERS OF ART.

UNION and co-operation amongst architects do not imply any agreement in questions of art. What with buildings that defy all principles of artistic design and proportion, and public denunciations of methods which are intended to promote architectural education among the profession, any common grounds of action appear to be out of the question. Consistency or congruity in matters of taste is certainly not one of the results to be anticipated from advanced knowledge of the requirements of the profession. Organisation has done something to further the interests of architects by uniting members of one class where individual efforts would necessarily fail; but it has been powerless to draw artists together upon questions which lie beyond the realm of construction and matters of fact. Abundant instances of this are to be found. When a large space is recovered from street reconstruction, or a site is opened, the authorities resort to experimental models in the absence of ideas, and artists with any at all are the most bitterly contentious of opponents. The factions of art are almost as numerous as those of theology; in fact, the *odium theologicum* of the schools may be found amongst artists whenever any party cry is evoked—witness the angry recriminations of those who took part in the "Battle of the Styles" not many years since, or in any controversial subject which comes up for solution in the newspapers. There is no rallying ground. The proposed polychromatic treatment of great national edifices like St. Paul's provokes the most conflicting views, and architects have ranged themselves on opposite sides, according to their tastes and proclivities. In fact, denominationalism in art teaching will exist as long as men think differently; but while we must make allowances for individual sentiments and tastes in questions of art, there are certain rules and canons about which all artist ought to be agreed, whatever their leanings and idiosyncrasies. We expect to find this general consensus of opinion in those bodies and societies of professional men which are supposed to represent the architectural profession. How strange, therefore, it seems when we find discrepancies amongst those who should set up a standard of taste, and to whom the public look for enlightment and instruction.

It is certainly instructive, if it is not also discrediting, to find the President of the Institute in his annual address censuring, in strong terms, an erection which everyone will admit is a disfigurement to one of our noblest public edifices; but more extraordinary to find it is an erection from designs by, and executed under the direct supervision of, a member of his own body, and the meeting formally passing a resolution calling attention to the injury being done by one of its Fellows. But this is by no means a singular case in which the architectural designs of members have been critically animadverted on. The public may well be amazed. If doctors disagree, who is to decide? Surely the Areopagus of architecture is quite within its rights to institute inquiries and express an opinion; but the public look upon the archons as incapable of committing grievous sins against good taste, or at least incapable of spoiling a public edifice by another erection. The ordinary individual at least would imagine that any architect could not defy ordinary rules of correct art. A professional body may censure those of its members who accept illicit commissions from tradesmen and others, and lay down rules of professional charges and conduct, for there are black sheep in every flock; but it cannot, without appearing rather "small," afford to criticise buildings for the violation of very common rules of art, which every architect ought to observe, for many would be taken to task if this authority were exercised. When any flagrant case is brought to notice, however, silence would be reprehensible.

The want of unanimity among architects in respect of the common basis and grounds of their profession, however, has been lately made very apparent by those "memorialists" who protest against the attempt to reduce architecture as an art to a matter of examination. When we see so eminent and successful an art architect as Mr. Norman Shaw, R.A., attacking the scheme of examinations formulated by the Institute, and denouncing the division of architects spoken of by the President of that body in his address, we may ask, indeed, how these things can be? When architects of repute contend that constructive geniuses and men of business are not architects at all, while the Institute includes them within the ranks of the profession, the public naturally inquires, Which is right? Mr. Norman Shaw asserts that the Institute cares nothing for art, but only seeks to enrol architects as members. The public do not trouble themselves about the threefold distinction, but simply look to results. They see many of our most eminent architects, outside any professional body, designers of important public edifices, while those who have gone through the examination test are unknown as architects. No one is so silly as to imagine we can implant artistic genius into any one, or develop it if it is latent, by examination, neither can we m musicians or poets by such means. But employer of an architect prefers to have who is not only talented but competent look after his interests, who knows w good construction is, and to be competent deal with liabilities should they arise. least, there is a kind of knowledge that car tested—that which concerns common mat of law and business, and the public hav right to be assured that a professor of the is competent in these points. Examinat or registration will at least insure public that the individual so attested capable of knowing good from bad constr tion, sound from inferior materials, gen being left out of the question. So that see in all these instances proofs of want agreement among members, and furt that the foundations of art are not e accepted by all architects alike. If one p fessor can erect a monstrosity, and anot contend that art is "born," and cannot acquired, outsiders will begin to think th is no certitude. An architect who can des a building which shocks one's sense of g taste, and the affirmation that there is no for an architect, are consistent aspects of question—one explains the other. Un this unsatisfactory state of opinion, bear upon the commonest principles of art would be hard to say that incorporation architects has done much towards m gating ugliness, unless we believe, as must do, that there is something wanting the education of those who practise art. canons of good design are certainly beyond our reach. Genius ought not to necessary to enable a committee of arc tects to decide whether a design is in agr ment or not with a certain standard of g taste.

If we turn to the question of the plication of ornamental design to s matters as surface decoration, wall-pap relief ornament, and the like, we find v irreconcilable views, often positively cont dictory to the principles of the best peri of art. Some who have been taught in school of conventionalism have sudde gone over to the naturalistic camp, and h designed ornament in utter disregard of th principles which have been universa accepted. In the "conventional" style, rendering of natural forms is made to ag with the material and decorative characte the work. A restraint is imposed on forms adopted, and the material and posit of the ornament is kept in view. brought up in this method cast round novelty, and at last adopt the very oppo extreme. Regarding conventions in art akin to a slavish following of precedent, t think that "naturalism" offers them n scope for their invention; but in realit is exactly the reverse. The adoption natural forms imposes no principles and restraints; sprawling vegetation or l age of the most unsymmetrical position is mistaken for decorative sign; even the accidental and imper freaks of natural growth are rep duced with a fanaticism worthy only primitive fetichism; the meaning of "or mental" is completely ignored for n literal reproduction of the weakest kind. this mistaken view of art, principles are c pletely subverted to mere unrestrained fa This unintellectual art is even spread to architecture. Those principles wh Classicists and Gothicists have alike spected as primarily necessary, are in dan of being repudiated by a few minds believe that anything is architectural dire it takes root and is made the object certain cult; that the most debased form Dutch Renaissance and Spanish extravag in detail, in which all distinction betw Gothic and Classic appear to be lost, worthy of following.

E SYMBOLISM AND ICONO-RAPHY OF EARLY AND MEDI-EVAL CHRISTIAN ART.—XIX.

y George Ashdown Audsley, F.R.I.B.A.
hor of "Handbook of Christian Symbolism," nd several works on Architecture and Art.)

Sixth Subject.

EXT.—"And God said, Let the waters bring n abundantly the moving creature that hath and fowl that may fly above the earth in the firmament of heaven. And God created great les, and every living creature that moveth, h the waters brought forth abundantly, after kind, and every winged fowl after his kind: God saw that it was good. And the evening the morning were the fifth day."

the illustration from the mosaics of the Cathedral of Monreale, in which the ator is depicted dividing the waters from dry land, and creating grass, herbs, and t-trees, He is shown seated on the zoned e or disc, with His feet resting on the dry l, and having before Him a piece of er, on the shore of which grasses and s are shown growing (see Fig. 55), so , in the illustration of the events of the h Day, Fig. 56, we find Him occupying ecisely similar position, the only essen- difference in the picture being that the ses and trees do not appear, their place g taken by nine birds of different ies. The mountain, however, remains.

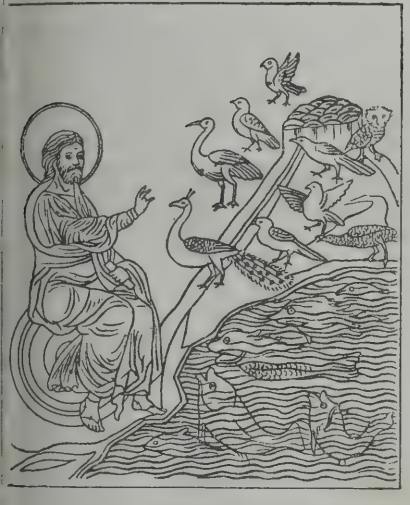

Fig. 56.

he water are represented several fish ming towards the Creator; whilst, as just been said, on the dry land are ted several birds, conspicuous amongst h is the peacock with its brilliant tail. biblical story of this Day's work is here hically and simply told by the mediæval icist—a page which he may read who

the series of subjects in the vestibule of Mark's, at Venice, the representation of Fifth Day does not differ materially that just described. The youthful e of the Creator stands with a space of r before him: in the water are repre- d fishes, whilst above it are depicted flying.

aving such early efforts of symbolic art, hich one finds a simplicity and direct- of aim which almost disarms criticism, ay turn to the more ambitious works of times. We find better drawing or lling, and a more artistic distribution rts, and steps towards correctness in ective, but it is very questionable if the s of Creation are a whit more clearly rth, or the mysteries of the primal made more intelligible to the observer's . Take, for instance, the representa- of the Fifth Day, in the sculptures of athedral of Orvieto. We find a rugged cape represented, through which rushes a river, and in the foreground of which are two stunted trees. Standing on the nearer bank is the Creator, attended by two angels, holding in His left hand a closed scroll, and stretching forth His right hand towards the river, as if in the act of calling into existence the fish which swim therein. On the farther bank of the stream stand several large birds, stiffly disposed and greatly out of proportion with respect to their surroundings.

Speaking of the Orvieto sculptures, and of this one in particular, Lady Eastlake remarks:—"We now turn to Art proper, which presents but few instances of these subjects. As the development of its powers gradually outstripped the short-hand process of early efforts, the acts of the first days, except in such cases as we have just instanced, were gradually omitted. The curious sculpture on the west front of the Cathedral of Orvieto, executed, it is supposed, by the followers of the Pisani, is perhaps the most important series of the Days of Creation existing. Here, in some measure doubtless owing to the conditions of sculpture, which does not admit of subjects requiring colour, the series commences with the Creation of Fishes and Birds on the Fifth Day. Here the Creator is seen attended by two angels, who accompany Him throughout, and seem, by their expression and actions, intended to suggest the emotions proper to the scene. Thus they hover behind Christ as He stands on the brink of a stream blessing the fish who are disporting in it, while the birds stand on the opposite cliff in a stiff row, as if awaiting the divine mandate. In this scene the eagle and the goose are easily recognisable; while some songster of the grove alights with outspread wings on a bush close by, and in the distance a hawk stands by itself." We have in the preceding article (XVII.) directed attention to the portraiture of the Creator in the Orvieto sculptures, and need not reopen the subject here. It will, however, be observed in the above quotation that its writer speaks of the Creator as "Christ."

Seventh Subject.

Text.—"And God said, Let the earth bring forth the living creature after his kind, cattle, and creeping thing, and beast of the earth after his kind. . . And God made the beast of the earth after his kind, and cattle after their kind, and every thing that creepeth upon the earth after his kind. . . And God said, Let us make man in our image, after our likeness: and let them have dominion over the fish of the sea, and over the fowl of the air, and over the cattle, and over all the earth, and over every creeping thing that creepeth upon the earth. So God created man in his own image, in the image of God created he him; male and female created he them. . . And God saw everything that he had made, and, behold, it was very good. And the evening and the morning were the sixth day."

The acts of Creation embraced by the Sixth Day are threefold. In the first place, there is the creation of animals and creeping things; in the second place, the creation of man or Adam; and in the third place, the creation of woman or Eve. Art has always recognised these acts as distinct. According to the wording of the above text it would appear as if the creation of both the man and the woman took place at the same time: and, doubtless, had the Mosaic description gone no further, artists, in essaying to set forth the acts of the Sixth Day, would have represented Adam and Eve as called into existence, side by side, at the same time. This, however, was never done; and in mediæval renderings two distinct and independent acts are set forth. The authority for this treatment is furnished by the following:—

Text.—"And the Lord God caused a deep sleep to fall upon Adam, and he slept: and he took one of his ribs, and closed up the flesh instead thereof; and the rib, which the Lord God had taken from man, made he a woman, and brought her unto the man."

In the series of mosaics in the Cathedral of Monreale there are two independent subjects devoted to the Sixth Day. In the accompanying sketch of the first of these (Fig. 57), the creation of the animals and of Adam is set forth. The figure of the Creator is almost identical with that in the preceding subject, and the mountain is again repeated. Beyond the mountain are represented several animals, including the elephant, camel, horse, ass, ox, and sheep. These have been created, and are moving away. In the foreground is Adam, seated on the ground, from which he has been created, and apparently receiving, direct from the lips of the Creator, the breath of life. "And the Lord God formed man of the dust of the ground, and breathed into his nostrils the breath of life; and man became a living soul." The treatment of the Monreale subject is simple, true to the Mosaic description, and direct in its teaching. It must never be forgotten that all such pictures were intended as books for those who could not read; as teachers at a time when the million had neither schools nor books to instruct it.

In the series of mosaics in St. Mark's, at Venice, the creation of the animals is kept distinct from that of man. The Creator is, in the first instance, represented standing with animals in pairs before Him. In the second

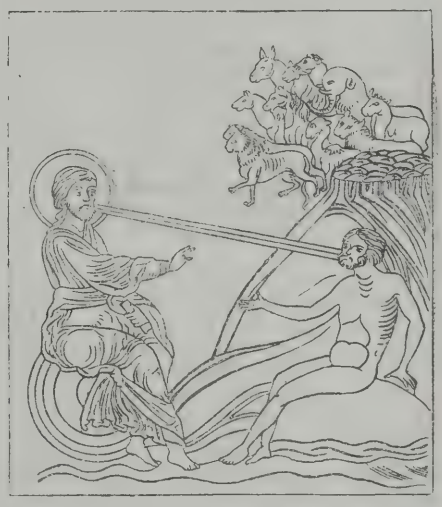

Fig. 57.

instance, He is depicted, accompanied by six angels (probably intended to typify the Six Days of Creation), with a dark and shapeless figure before Him, which He is touching. Then again the giving of a living soul to Adam is represented in another subject in which the youthful figure of the Creator is holding towards Adam a small, winged-being in human form. As Lady Eastlake remarks: "In the second act the infusion of the living soul is seen. In the mosaics of St. Mark's this is curiously and beautifully given, with the help of classic reminiscence, by a little spirit with butterfly wings—the true Psyche—which flies up to Adam's face, while the Creator stands by." Notwithstanding the poetical character of this treatment, it fails to convey the words "and breathed into his nostrils the breath of life" in the direct and simply way set forth in the Monreale subject.

In the sculptures at Orvieto, the creation of the animals and the creation of man are kept distinct. In the former the Creator, accompanied by two angels, is represented standing, with His right hand outstretched in the act of blessing a group of animals. In the latter, the Creator stands with His left hand resting on the head of Adam, and His right hand elevated in the act of blessing. Adam is just in the act of assuming an erect position, as if suddenly endowed with anima-

tion. There is here a remarkable lack of artistic expression which goes far to lower the standard of this representative series.

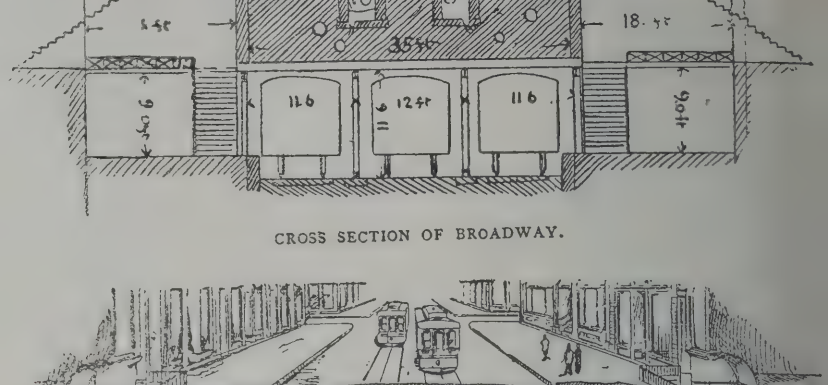
In the miniature in "Cædmon's Metrical Paraphrase" of the Creation of Adam and Eve, there is no special act of creation represented in the case of Adam, for he is shown reclining asleep on a bank, whilst the Creator is stooping over him and extracting the rib from his right side. On a higher part of the miniature the Creator is depicted blessing Eve, who looks upwards to the face of God as if suddenly endowed with life.

The words of the text, "and the Lord God formed man of the dust of the ground," seem to have taxed the ingenuity of mediæval artists, in their desire to render the statement of scripture in a direct and expressive manner; and some crude and curious efforts were the result, as might reasonably be expected. For instance, in a miniature in an Italian manuscript of the 13th century, the Creation of Adam is thus represented. In the centre of the picture is an almost shapeless mass, supported in an upright position by the hands of an angel. Opposite this pillar of earth, or clay, stands the Creator, an aged figure, robed, and invested with the tri-radiated nimbus, in the act of blessing, or, more probably, creating. Speaking of this miniature, Didron remarks:—"God is in this picture assimilated to a great artist, himself giving the finishing touch to a work that has been brought into form by an inferior artist. The inferior artist is here represented by the angel who is fashioning the clay, giving it a rude and imperfect form and semblance of a man. This man is, as yet, merely clay, formless, motionless, and devoid of life. God the Creator is here present, with his right hand raised in the attitude of benediction, blessing the roughly-modelled statue which is to be Adam; and breathing into it the breath of life."

Turning now to the scenes on the wonderful bronze doors, by Ghiberti, of the Baptistery at Florence, we see the creation of Adam simply and beautifully rendered. Adam, a finely-developed and manly form, naked, in the prime of life, is shown as if rising from the ground, his left hand being held in the left hand of the Creator. The Creator is represented as a man of venerable aspect, heavily draped, without a nimbus, and leaning forward with His right hand raised in the act of blessing. Animal and spiritual existence are here both expressed, for God the Creator is raising his form from the earth with one hand, and bestowing a benediction on him with the other. Art could go no further, for even the giant artist, Michael Angelo, sought inspiration from this work for his Adam in the Sistine Chapel.

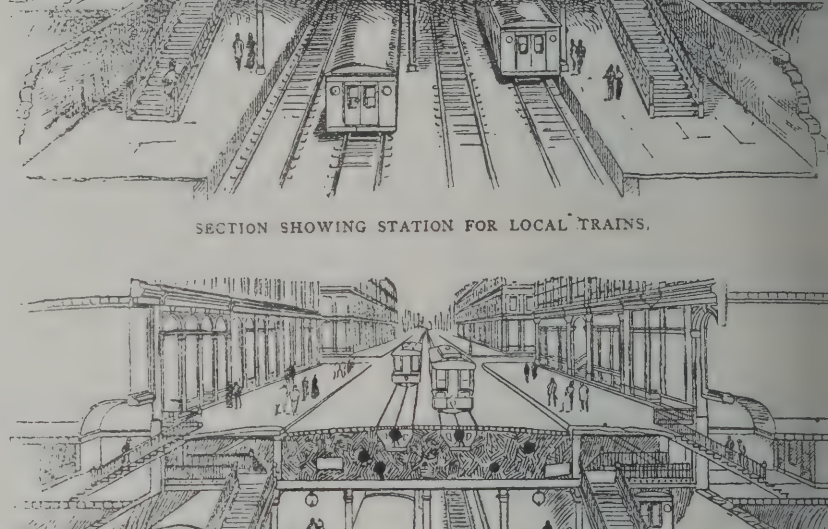
(*To be continued.*)

THE RAPID TRANSIT PROBLEM IN NEW YORK.



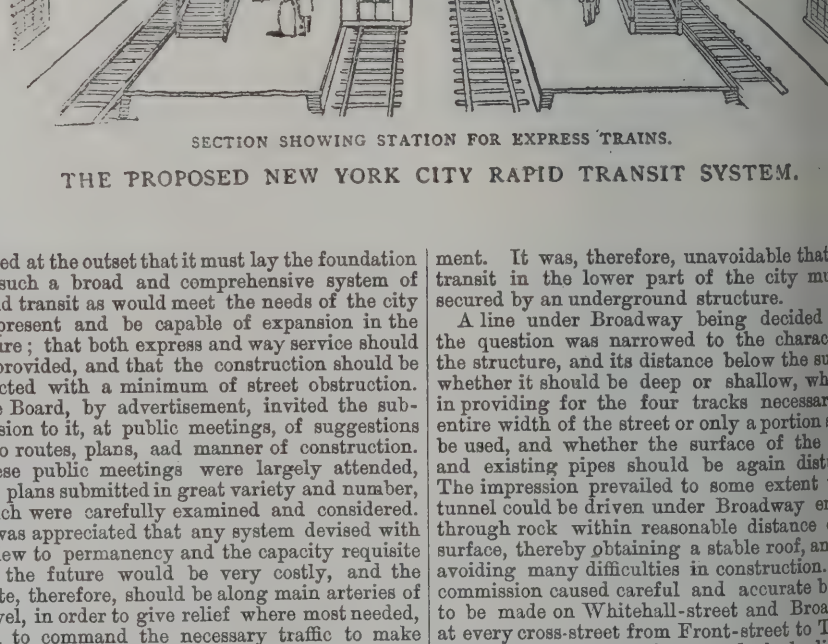
THE Commissioners appointed to consider this pressing question as to how best to overcome the congested condition of the streets of New York, and furnish a ready and rapid means by which business people may be enabled to travel quickly to and from their offices and shops, have just issued their report. The drawings, which we now reproduce from the *Engineering Record* of that city, show the kind of proposed road which is advocated under the Broadway as a commencement. In 1887 a Government Commission advised viaducts for such rapid transit, having heavy steel rails on ties laid in an elastic material between the floor and the ties, the aim being noiseless motors, with cars propelled at high speed through the open air. Now an underground scheme is advocated; but whether it shall be carried out by private companies organised for the purpose, or by the public authority, remains, for the present, an open question.

The Board in entering upon the duties imposed upon it by the statutes of the State, determined at the outset that it must lay the foundation for such a broad and comprehensive system of rapid transit as would meet the needs of the city at present and be capable of expansion in the future; that both express and way service should be provided, and that the construction should be effected with a minimum of street obstruction. The Board, by advertisement, invited the submission to it, at public meetings, of suggestions as to routes, plans, aad manner of construction. These public meetings were largely attended, and plans submitted in great variety and number, which were carefully examined and considered. It was appreciated that any system devised with a view to permanency and the capacity requisite for the future would be very costly, and the route, therefore, should be along main arteries of travel, in order to give relief where most needed, and to command the necessary traffic to make the line remunerative.



With this much determined, the two governing questions remaining were the general plan of the structure and the motive power to be used. Appreciating that a viaduct of masonry would be the most desirable means of transit, the Commission considered many plans for such a route. An elevated structure on Broadway below Thirty-third-street was prohibited by the statute. A viaduct of masonry was manifestly impossible on any adjacent street. A viaduct through the blocks in the lower part of the city, the Commission believed to be too costly, and subject to too many delays in the acquisition of property rights, to be within reasonable hope of attainment. It was, therefore, unavoidable that transit in the lower part of the city mu secured by an underground structure.

A line under Broadway being decided the question was narrowed to the charac the structure, and its distance below the su whether it should be deep or shallow, wh in providing for the four tracks necessar entire width of the street or only a portion be used, and whether the surface of the and existing pipes should be again dist The impression prevailed to some extent tunnel could be driven under Broadway e through rock within reasonable distance surface, thereby obtaining a stable roof, an avoiding many difficulties in construction. commission caused careful and accurate b to be made on Whitehall-street and Broa at every cross-street from Front-street to T third-street. These borings conclusively di of the idea of a continuous rock roof for a t except at such depth or with such grade a almost, if not quite, prohibitory.



It followed then that a tunnel for a co able portion of its length—and that pr under the portion of the Broadway questions of property rights would prese greatest difficulties—must be driven th sand. The question was whether this co best accomplished near the surface or at siderable distance below, and, if the latter that distance should be. Much would upon the number and depths of shafts used. mere cost of excavating below ground wo

a small proportion of the whole when it is idered that all the excavated material for a modious four-track structure, with ample on and platform facilities, must be raised to surface through shafts opening on or near ded streets.

he question also arose as to what depth would re immunity from dangers when the material e excavated was sand, liable to be wet and to with this liability increasing with the depth, when the pressure from above was that of dway's heaviest buildings. To this nothing trial and experience could give an answer.

difficulties of ventilation and drainage ase with every foot of depth. A deep el would require elevators as a means of ss, and stairways would be necessary in tion, which, except for emergencies, would ractically useless, and to properly provide emergencies must be broad and costly. ern and improved elevators in sufficient bers would doubtless provide for the regular me of traffic at ordinary stations, but they not believed to be adapted for large crowds, as must frequently gather on a line of sit under Broadway. Stairways 100ft., more ss, in vertical height would be of no avail as ces of relief for crowds moving upward, and ld be extremely dangerous for crowds moving nward. Moreover, it is not believed that a subterranean line of transit, with elevators, ld attract short-trip passengers, and the short- business is absolutely essential for the success ny line the cost of which at all approximates of a four-track tunnel in New York City.

is admitted the nearer the station platforms to the surface the more attractive the line. ly accessibility by means of short, broad, and modious stairways, supplemented where ssary by elevators, better light and better ilation at stations, light and air at inter- iate points if necessary, and the feeling of ter security on the part of the public—these, other considerations, led to the decision upon part of the Commission, to place the under- nd structure as near the surface of the street ossible, and the engineers of the Board were cted to submit two separate plans, one for tracks on a single level, the other for a le-deck tunnel with two tracks upon each

hese plans were prepared, the one providing our tracks on a level, at the minimum dist- below the surface to admit of the non- rbance of existing pipes, conduits, and other erground structures, and occupying sub- tially the entire width of Broadway from to curb, but not at such depth as to require vation below the foundations of the heaviest most costly structures abutting on the street. he other plan of double-deck tunnel would py less width of the street, and presented the ntage of the removal and replacement in eries of the pipes and other existing under- nd structures. A disturbance of the street ace would be unavoidable in this case, but a t and permanent benefit would be derived the fact that such disturbance would not be ated in the future for any cause, except the ing of the pavement, as the pipes in gal- s would be accessible at all times for purposes epair. The excavation required by this plan about 4ft. more in depth than by the other. length of stairway to the local stations ld be less, but to the express stations, greater in the other plan.

hen the Commission decided to adopt an erground route, it was decided that the ive power must be secured without com- ion in the tunnel. Much attention has been ted to the consideration of electricity as a ive power. Consultations have been held eminent electricians; experiments have witnessed; electric roads in operation have examined. While the Board is convinced electricity as a motive power is available for purposes of the railway recommended by this rt, it is not deemed wise at the present time xclude other forms of power answering the ntial conditions of speed and non-combustion he tunnel, or to attempt to direct the exact od of application of such power as shall ly be adopted.

E ARCHITECTURAL ASSOCIATION.

HE third ordinary meeting of the Associa- tion was held on Friday evening, the ident, Mr. F. T. Baggallay, in the chair. The following 13 new members were elected: Messrs. S. W. Curtis, L. Walmisley, G. H. Manning, W. E. Tower, Ernest Mouatt, F. Catling, J. K. Bateman, J. Allen, P. H. Nowell, R. E. Bennison, A. Wood, M. S. Hack, and A. Nicholson. Seven nominations were also read.

No other nomination for the vice-presidency—rendered vacant under the rules by Mr. F. R. Farrow's acceptance of paid office as a lecturer—having been received, Mr. Farrow was unanimously and by acclamation re-elected. Mr. Farrow briefly returned thanks.

THE PLANNING AND CONSTRUCTION OF AMERICAN FRAME HOUSES.

Mr. C. H. Brodie read a paper on this subject, illustrated by some sketches, details, and tracings by the author, and also by numerous plans and perspectives from the United States professional journals. Mr. Brodie mentioned that he was engaged on business in America during the winter of 1887 and the spring of 1888, during which time he spent considerable time in New York and Chicago, with flying visits to Boston, Baltimore, Philadelphia, Washington, Pittsburgh, St. Louis, Kansas, Milwaukee, St. Paul, and Minneapolis, and other cities. Such houses as were illustrated on the walls are, he remarked, the type of American homes, alike in the north, south, east, and west. In the actual town areas the erection of timber houses is now forbidden. Still, in the Southern States universally, and over the country and suburban districts generally, it is rarely that any but timber houses are erected. The average time for erecting a frame house is ninety days, but many have been built in sixty days, and whilst the life of the structures may be averaged at fifty years, there are very many in existence even a hundred and some two hundred years older and over. Again, stone quarries as yet worked are few and far between, and brick-works are not by any means numerous. But the country abounds with the most beautiful timber, with which even the denuded Eastern States are kept plentifully supplied by means of immense rafts floated down the great rivers to convenient points for transport by rail or boat. A frame house may be very expeditiously erected. The drawings on the walls show a basement, rising only a foot or so out of the ground, built of either brick or undressed stone, and on this is a frame of quarter partitions, two stories high, forming inclosure and divisions. These and the joists being fixed in position, the roof can be immediately constructed and covered in, so that whilst the outside is being completed, the inside, too, is progressing, and during the time that we should be getting up a scaffold, the frame house is built. The plasterwork being then, if necessary, dried by artificial heat, the joinery and other fittings are placed, and the dwelling is ready for occupation in a very short time. Should the worthy owner's family increase, additions to the house are just as easily and expeditiously made. The plans show a basement and two upper stories, and the roofs being mostly of steep pitch, plenty of room for attics is obtained in them. The basement contains a laundry, beer and wine cellars, coal cellars for both house and furnace coal, larders, and the heating chamber, containing either a boiler for steam or a furnace for hot-air heating. The heat there generated is distributed by ducts quite evenly over the whole house, and most of the rooms have no fireplaces. This is a stage of civilisation to which we have not yet generally attained. Where fireplaces do occur, and this is chiefly on the ground floor, an ashpit is provided under each, into which, when the hearth is swept up, the ashes, &c, are dropped by moving a dump or hopper. These ashpits are marked on the basement plans. The ducts serve in the hot weather to distribute cold air over the house, the air in the cellar, whence they start, being naturally cooler than that outside, whilst it can, if necessary, be cooled still further by artificial means. Coming to the ground floor or first story, as their plans have it, we find a parlour and dining-room, and also perhaps a library or a second parlour. The dining-room is always in connection with the kitchen through a lobby or pantry. You will note, also, that there is no scullery shown, although on some of the plans is a diminutive space marked "sink-room." On this floor are also various store-rooms and closets, w.c.'s, lavatory, &c., depending as to size, number, and variety on the general dimensions of the house. And here I would call special attention to the very complete way in which all classes of American houses are fitted with cupboards, shelves, drawers, sideboards, book-cases, &c.—all conducing in so eminent a degree to the comfort and ease of the occupants. No bed-room that I occupied in any private house in the States was without a cupboard large enough to walk into and turn round in. The convenience of this is too obvious to need expression. The hall is always furnished, and used as a room; most of the American plans have it designated "reception-hall," and some even "sitting-room." The verandah is also a most important feature, and one never omitted. During the hot season it is inclosed with blinds, and becomes the most frequented part of the house. The first floor has the usual bed and bath rooms, linen closet, &c. You will observe that in most cases the w.c. apparatus is kept away from, and not, as with us, next to, the outside walls. This is to avoid fracture by freezing during the intensely cold weather. To return to our first-floor plan. You will note that all the chief bed-rooms have a fixed lavatory fitting generally in a cupboard, so as to be out of sight. This adds, of course, very considerably to the plumber's bill, but in the long run it is a great saving, for labour of all kinds is terribly costly. Balconies are freely provided on this floor, and are delightful spots in the hot weather, whilst they always form a feature in the elevations. The attics are used for servants' rooms,—each still with a good cupboard—box-rooms, store-rooms, &c., or the space is frequently just floored and then left to be cut up as the wants of the occupants may later on suggest. About the elevations, outside and in, or the artistic part, one need say nothing, except that, to our eyes, the calm and dignified treatment of the English example contrasts very favourably with the fussiness and over-picturesqueness and evident striving after "features," which spoils so many of the other designs. The construction you can study at your leisure by referring to a specification printed in blank, which is in the Institute Library. It is indexed under the name of the publishers, Messrs. Palliser, of New York, to whom I am indebted for a good deal of the information this paper contains, and for a drawing and specification hung on the wall. I was struck with the very practical character of the specification. For instance, among the general clauses I read: "The carpenter will make all patterns, &c., and will provide suitable protections to all openings to keep out the cold, rain, &c., and will clear the building of all carpenters' waste materials before the plastering is commenced. The mason must provide coal and stoves in cold weather for heating the building while his work is going forward and until it is dry." Continuing, we shall get particulars as to how this class of house is put together, and we naturally find after the general clauses the necessary directions as to the excavations. The only unusual point here is: "The bank is to be dug well away from the walls, and left open until the walls are set and dry." The damp course is to be either slate and cement or asphalt. The brick walls are required to be built to "a true line from one end to the other, even to the cutting of a brick where necessary, so that the carpenter can size the joists to an exact width, and place them directly upon the wall without blocking up with chips or pieces of wood." The facing of these brick walls is to be "neatly tucked and properly cleaned down with aquafortis, and oiled with raw linseed-oil at completion," care being taken not to injure, in cleaning down with the acid, any cut stonework. The laths for lathing are to be "laid a full ¼in. apart, and joints broken every 18in." Wood laths, however, are now rarely used. I never saw any at all. The plastering is put on wire netting, or one of the many forms of pierced or expanded metal now coming into use in this country. The plastering is to consist of "A good coat of brown, well-haired mortar, made of pure unslaked lime, and clean, sharp back-sand, free from loam and salt, and best cattle or goat-hair, well mixed by continued working, and stacked in the rough for at least —— weeks before putting on." The finish is to be "A coat of best soapstone finish, manufactured by the company, composed of finishing-lime, putty (two parts), and patent soapstone finishing (three parts), thoroughly mixed two days before using, and applied in the most careful manner, as per directions"—I suppose of the manufacturers. The order of the trades as they are placed in the specification differs considerably from our usual arrangement; and we next come to the carpenter and joiner. All the timber which will be ex-

posed at the finish is required to be of a certain quality pine. The joists are to be placed, in all cases, with the "crowning" edge upwards, and those over so many feet in length are to be "worked crowning" so many inches before being placed in the building. Describing the partitions—a most important item of a framed house—the specification directs that "all door and window studs are to be set double, and all openings over 3ft. wide trussed overhead. All angles must be formed solid by blocking and spiking two studs together. No studs are to stand on the floor, nor on the joists, if there are partitions under, but all are to foot on top of the partition-plate below." The outside of the external partitions, and also the roof, is covered with ⅞in. match-boarding, called "sheathing," which has to be "nailed at each edge at every bearing with 10d. nails." Nails throughout the specification described as so many "penny" ones—a nomenclature common also in Ireland. The whole exterior is then covered with waterproof felt, the joints lapping 2in., and it is tarred under all architraves, friezes, cornices, brackets, &c., "so as to make a perfectly tight job." Outside this felt comes the finish, which is actually seen, which on the partitions is weather-boarding, or, as it is called in the States, "clapboarding." This is to be of "clear, dry, bevelled, white pine, 5in. in width by ½in. thick at the butt, and $\frac{3}{16}$in. at the thin edge, laid with not less than a lap of 1½in., and nailed with 8d. box nails every 16in. The nails to be set in." The verandah floor is to be constructed with 1¼in. by 3½in. white pine boards, laid with "paint joints." The roof is generally covered with shingles, and so also are the gables and other features. The shingles are usually of cypress, which grows abundantly in the swamps of New Jersey and the more southern States. The logs are floated down the river to the various mills, where the shingles are cut in enormous numbers. One mill cuts 300,000 daily. They are about 18in. by 6in., and are fixed on battens, with on roofs 5½in. to the weather, and on vertical parts 6in., each nailed with two nails and kept 3in. from angle of valleys. Sometimes the roofs are of slate, and frequently they are flat, in which case they are mostly covered with tin, although asphaltum or gravel composition is sometimes used. In either case the roof is boarded on the joists with ⅞in. boarding. Coming to the floors, pugging—or, as it is called, "deafening"—is used to all the best rooms, and these have also a double floor—a rough deal one and a hardwood finished one, with between them a layer of "all-wool, Pyramid-brand, rosin-sized, deafening felt," fixed down by 2in. to ½in. slips, to which the hardwood floor is secret-nailed. The rough floor is described to be fitted carefully round all studs, &c., up to the sheathing, so as to prevent mice circulating. Here is a good clause—"All the plastering is to be finished, cellar cemented, and all mason work done and thoroughly dried through before any of the interior joinery is brought into the building or put in position." The materials used for doors are required to be thoroughly seasoned and kiln-dried, and on the plans the sizes for both width and height are figured. Sliding doors are much used, while many openings have no doors at all; these would be provided with curtains, which give the desired privacy. There is no question of "draughts" in an American house, which is warmed equally throughout. All the doors have a hardwood slip ¾in. thick, splayed each edge, fixed under them. This enables the door to open clear of carpets, &c. The windows are mostly double-hung sashes requiring no special description. All are directed to have a burglar-proof fastening. After a description of the stairs most minute directions follow for the fittings of the various pantries and closets upstairs and down. These include clothes-closets, linen and china ditto, and butler's and kitchen pantries, as well as the various store-rooms. Then we get a full description of the refrigerator and ice-safe, which consists of two thicknesses of boarding, 2in. apart, filled with mineral wool, then an air-space of 1in., and a layer of rosin-sized waterproof paper, the actual inside being of clean, narrow-matched spruce. The lower part is the iron-safe or tank, and it is lined with sheet zinc, and the bottom covered with a wood grating to prevent the ice cutting the metal. The doors of these spaces are constructed in precisely the same way, and the joints between door and frame are double rebated. The wood finish is described to be first a certain patent "mineral filling," and then another "patent transparent wood finish." The hardwood floors are to be done in the same way, but with a "vegetable" filler. The tinwork is to be painted two coats of metallic paint, and here I may say that this tin—or to speak more correctly tinned iron — is used wherever we use lead, and also for the rain-water pipes and gutters. Lead is too expensive, and is also more affected by change of temperature. The hot-air ducts from the surface in the basement are also made of tin, and are run up in the partitions. The hot air is delivered into the rooms through a sort of hit-and-miss grating, called a "register." The positions of these are shown on the plans. Coming to the plumber's work, the soil-pipes are invariably of cast-iron, the joints being made with oakum and lead well caulked. They are painted on the outside with two coats of metallic paint, one before and one after fixing. Inside they are coated with coal-tar, or the pipes are "Mott's enamelled soil-pipe, not less than $\frac{3}{16}$th thick." The soil-pipes are kept well within the building, the water-closet apparatus being away from, and not next to, the outer walls. The siphon intercepting the drain from sewer is fixed within the cellar, and the drains, generally, in fact, are inside, and not outside, the building, so as to be clear of frost. The water-pipes are of lead, all so arranged that they may be run dry—also to baffle Jack Frost—and laid on wood strips or in wood troughs. And here occurs another very practical passage: "The plumber is not to cut any timbers; that will be done by the carpenter, and he shall not cut any to weaken them." Would that we could enforce that clause on both plumbers and gasfitters! Joints (lead to iron) are made with brass ferrules soldered to lead and caulked to iron as before described. The whole of the drainage has to be done according to municipal plumbing regulations, which are very strict. They often require that all soil-drains, as well as the vertical pipes, shall be of heavy cast-iron, and in all cases that the soil-pipes shall be carried through the roof full size, and left open at top, and that an air inlet shall be provided on the house side of the intercepting siphon. Also, that all sanitary fixtures shall have a trap as close to them as possible, each of which must have a back air inlet to prevent siphonage. Brass piping is sometimes used for hot-water connections, but galvanised wrought iron is much more common, and seems to be equally satisfactory. As to the cost of these frame-houses, one of the buildings illustrated is shown to have cost 2,935dols., or £587. This is a small house. A friend of mine writes to me that he is just about building a ten-roomed house, which he says will cost from £700 to £850, and he puts the life of this as at least fifty years. A very small house illustrated and described in a local paper is said to cost only 1,500 dols., or £300. In conclusion, I will quote the dedication of a book of designs of houses of this class. Prose is evidently too feeble to properly commend the subject, so the book is inscribed:—

> "To those who happy homes have always known,
> To those who plan and work such homes to own;
> To all who building homes would bless mankind,
> To all who in their homes a refuge find;
> To youth, whom wedded life will soon employ,
> To children dear, each day their parents' joy;
> To all who favour honour, truth, and love,
> To all whose virtues promise homes above.

Mr. Owen Fleming, in proposing a vote of thanks to Mr. Brodie for his paper, observed that it did not seem that the substitution of stained and varnished surfaces for paint in all internal woodwork would be so effective and pleasing as the lecturer appeared to regard it. The paper had been almost exclusively confined to matters of planning and construction; but some of the designs on the walls only showed us what to avoid in elevations, although others were quiet and satisfactory in treatment. In the better class of designs hung, the idea of the architect was evidently to provide a building as simple as possible, with long, unbroken lines of wall and roof in one plane. He believed that if architects followed this plan they would get a better effect than if a design were covered with stuck-on features. More simplicity was needed in our designs. Other good features in American frame-houses were their simple proportions and their plain details.

Mr. Horace Townsend (who, it will be remembered, read a paper on "The House that Jonathan Builds" before the Association on March 20th last) seconded the vote of thanks, remarking that he had practised for twelve ye as an architect in the United States. He p tested against the hits in the paper at Ameri fussiness and anxiety for picturesqueness, as th failings, although visible perhaps in some of illustrations in American professional journ were not characteristic of American architect and it should be borne in mind that s of the best architects in the States decline allow their works to be illustrated in th journals. The great fault of the leading Ameri architects, in his judgment, was a straining a an artificial simplicity, which was an affecta almost as objectionable as over-fussiness. foremost American architects took as their mo of the comfortable house the old Colonial bu ings, which were entirely of wood, simple character, and influenced by the Classic can The great use of tinned or "terne" iron roofs was a very conspicuous feature; material was cheap, it lasted, if looked after painted, a good many years. The refriger was a feature of every American house of size, and was not only used to produce i water, but was absolutely essential for freez meat and even vegetables. It was a mist it had been found, to build a refrigerator the house, as it became "smelly" in a years, and had to be renewed. Of course the was put on the top, the cold striking downwa The provision of a hardwood sill to each door an excellent invention. Mr. Brodie had allu to Messrs. Palliser, an energetic firm of p lishers, who were endeavouring to popula architecture by issuing plans of all kind buildings, a complete set being sold for 2s 3s. The estimates of cost Pallisers gave ha be accepted with very great reserve, as they v invariably from 20 to 25 per cent. below the ac value of the work shown on the plans. Revertin the usual American house, he might remark the kitchen was always well fitted, and se also as scullery. The sink was much de than in our houses, preventing splashing; an the washing was done at home, a series of t large tubs were built in, each from 18in. to 2 in depth, having sloping sides and grated out and provided with hot and cold water t Such an arrangement might with advantag introduced into the smaller English houses. protested against the usual attempt to t American architects as promising child They needed no patronage and no good-natu half-hearted praise from English critics, for were well able to take care of themselves, an some respects were ahead of their En brethren.

Mr. F. T. W. Goldsmith thought the g feature of American house architecture was clever way in which the plans were arrang economise labour and promote the convenien the occupier. Cupboards in every room, water carried all over the house, and every d down to the hanging of the doors, spoke c endeavour to meet the requirements of the cl The reminiscences of old Colonial work were apparent in the better designs, and often a d Classical detail, as in balusters or columns, a piquancy to the whole. Mr. Golds championed the open fire as far more ple and comfortable than the best system of war by pipes, and suggested that in a house he by the latter method there must be a great ri cold air rushing in every time the door opened.

Mr. F. R. Farrow said while these wo houses were cheap and easily built, they inv great risk of fire. He also advocated the l lish open hearth as more comfortable than ducted heat for a climate like ours, wher temperature was never very low. Two str features of American houses were the attention paid to all internal details and concentration of decorative effect on ce points, the general surface being left pla act as foils. Much care was also take American architects to secure an alternati texture of wall surfaces. The effect of st woodwork as contrasted with the paint so in English houses, might be seen by a vi Professor Herkomer's studios at Bushey.

Mr. W. Henry White referred to the va ness of American specifications as contrasted our own.

Mr. J. W. Penfold, past-president, obj to the practice of planning w.c.'s near the ce of houses. Mr. J. A. Shaw remarked tha "terne" roofs, however unsightly, wer soundly welded together as to be thoro

er-tight. Mr. E. Woodthorpe inquired if fires were kept going all night throughout winter.

The President, in putting the vote of thanks, erved that Americans were so outspoken in ir criticisms of English methods that Mr. vnsend ought not to deprecate a free examiion of the methods of building. He thought re was little danger of an inrush of cold air a house heated by pipes, as the air in such a se, if the doors and windows closely fitted, under pressure, and was more likely to rush

Mr. Brodie, in replying, said all American ses were not unduly simple in architectural itment: some that he saw were fussy to a ree; others, on the other hand, had aped plicity, and overdid the effect in ostentatious nness. The President's explanation of the air being under pressure was correct; but, her, there were double doors and inner ies to halls, and when the cold was in- e, a second porch, packed away in the cellar ing the summer, was erected outside during winter. The sashes were also double hung. great reason for staining rather than paint that very beautiful figured woods were loyed for joinery and woodwork, which it manifestly wrong to cover up. An American se could not be reproduced here owing to the nibition of such construction by local authori- . He received a commission last year from American for a house to be erected on the mes-side, but was unable to find a site which client liked where the local by-laws were not nibitory. In the States, houses of this conction were almost always isolated. They e not so inflammable as an English house, as e were no fireplaces, and the floors were fire- of. The w.c.'s were placed in the bath- n, the apparatus being invariably put against inner wall for protection from frost. Of se the fire was kept going all night during re winters, the stoking being generally nded to by a negro boy.

PORTLAND CEMENT.
